The Organisation for Economic Co-operation and Development was established in December 1960 to achieve the highest possible economic growth and employment and increase the standard of living in member countries, to contribute to economic expansion in both member and non-member countries and to increase world trade. Whilst the reference to non-member countries occurs here, it is perhaps notable throughout the OECD literature, naturally enough, that the focus is upon OECD member countries so that many of the major issues of globalisation are not addressed since most of the member countries are wealthy, industrialised societies but there is a major concern for equality of opportunity within these societies running through all the documents.

The OECD's establishment preceded the widespread acceptance of neo-liberal economics a few years later, although its establishment was perhaps an early sign of economic globalisation. From its earliest days it was concerned with the place of education and it pioneered the concept of recurrent education as a strategy for lifelong learning (OECD, 1973) which it claimed to be a different approach to education since it argued that 'education opportunities should be spread over the individual's lifetime, *as an alternative* (underlining in origin) to the ever-lengthening period of continuing education for youth (OECD, 1973: 5). It is significant that from the outset OECD did not propose a system of formal education that was parallel to adult education since that would create another binary system. There was a genuine concern for equality of opportunity behind the OECD proposals since it focused from the outset on lower skilled people having the right to paid educational leave, as well as those who were more highly skilled.

By 1977, however, the term 'recurrent education' had disappeared: this maybe because there was a growing sense that it would be very costly to implement systems of paid educational leave as an entitlement, or even to see post-school education as an educational system, but the idea of the 'education of adults' assumed some prominence (OECD, 1977: 5). Moreover, the key concept became learning and it was suggested that there are five sets of learning needs: (1) remedial; (2) vocational, technical and professional competences; (3) health, welfare and family life; (4) civic, political and community competence; (5) self-fulfilment (OECD, 1977 vol. 1: 23–24). Thereafter there were further four volumes examining new structures, programmes and methods; non-participation; participation; and widening access for the disadvantaged (OECD, 1977–1981). Consequently, it can be seen that while the early publications of OECD on lifelong learning were work-orientated, they were genuinely engaged in all the issues of general adult education and many of the authors of specific chapters in these

volumes were well-known adult educators. As globalisation became more significant, so the concerns of OECD became more focused on the knowledge economy, and yet there was recognition that globalisation itself brought vulnerability (OECD, 1996: 30). Indeed, lifelong learning for all was the theme of an OECD Ministers' Conference and while the broader adult education issues are still apparent in the discussion documents, it is clear that the relationship between learning and work is the prevalent issue. Indeed, the first argument for lifelong learning provided is the learning economy. Both in placing this as the prime reason for lifelong learning and the introduction of the language of the global capitalism indicate how OECD has been affected by, and has in turn affected, the dominant economic policies of the period. Thereafter, the speed of change due to technology is considered as the second reason for lifelong learning, followed by discussion about education throughout the life cycle; the formation of human capital and social well-being of individuals is the fourth reason given and, finally, the issues of social cohesion are addressed as it is recognised that the wealth gap is widening (OECD, 1996: 90–92).

The European Union has deliberately responded to the social forces of globalisation in all three of its educational branches: education and training, higher education and lifelong (adult) learning. The policies in each can be seen both as a response to the global pressures and as a deliberate attempt to modify them. Enshrined in the Maastricht Treaty are Articles 149 and 150: the first seeks to develop a European dimension of education and the second focuses on the need for a vocational training policy. Without analysing the vast array of policy documents that have appeared since then, we can see that in EC 1995 White Paper on education and training appeared as *Teaching and Learning: Towards the Learning Society* (European Commission, 1995) specified three aims:

- Social integration
- Enhancement of employability
- Personal fulfilment

The latest document on lifelong learning (European Commission, 2001) specified four:

- Active citizenship
- Personal fulfilment
- Social inclusion
- Employment related aspects

In these cases the international pressures on European countries are modifying forces since they are as concerned with the integration of Europe as they are with the success of global capitalism. An example of this is the Bologna Declaration (2005) of 19th June, 1999, which indicates how European higher education should develop in order to make it compatible across the whole of Europe – this is part of the Europeanisation process, and lifelong in as much as it is still a response to the vocational demands on education and both education and training.

Two types of social pressure emanate from international agencies – those which would modify the global forces to some degree or other and those which reinforce the

global pressures. Significantly, those countries least able to fend for themselves are the most exposed to the international agencies that reinforce global pressures.

National

Two types of national responses to the global situation can be detected: those which seek to modify the global forces and those which seek to prevent them having any effect in their countries. However, differences can be found in national policy documents and using lifelong learning as an example, policy documents can be compared. In the UK, for example, *The Learning Age* (DfEE, 1998) was quite orientated to the economic needs of the nation and proposed such innovations as the University for Industry and Learn Direct – a national information service. This report certainly reflected the neo-liberal principles of the New Labour government and with it its desire to introduce lifelong learning, although in the first instance it made little reference to those other EU-specified aims of lifelong learning, although there is the one reference in the Minister's Foreword that says 'learning offers excitement and the opportunity for discovery. It stimulates enquiring minds and nourishes our souls' (DfEE, 1998: 10). A neo-liberal agenda had been set, and the UK became a leading country in Europe in implementing this agenda that is in accord with the demands of the global substructure. Significantly, citizenship does not play quite such a leading role in the UK as it does in the European documents, but the UK has been less concerned with Europeanisation than the Commission, although British citizenship – and the learning required from it – has become an issue as a result of the problems of migration which itself, in many cases can be traced back to the globalising forces and the wealth of the West. Economic migration is perfectly understandable in an unequal world.

One reason why the UK policies are more orientated to the global forces is because in the 1980s, during Mrs Thatcher's time as prime minister, it adopted a minimal state neo-liberal approach to government whereas most other EU countries did not. However, it is significant that as more countries are being forced to adopt more of the global pressures, many countries in Europe now appear to regard UK as a country that is leading the way.

In contrast to the emphasis of the UK government, similar documents from two other industrialised societies – one inside the European Community and the other in South-East Asia – reveal different emphases. The Finnish government's policy document had its own vision:

By the year 2004 Finland will be one of the leading knowledge and interaction societies. Success will be based on citizens' equal opportunities to study and develop their own knowledge and extensively utilise information resources and educational opportunities. A high-quality, ethically and economically sustainable mode of operation in network-based teaching and research will have been established. (Ministry of Education, 1999: 29)

As the Finnish vision is based on the citizens' opportunities rather than economic success and Hong Kong's vision is based on the learner's all-round development, and so the aims

of education in the twenty-first century are threefold: enabling students to enjoy learning; enhancing student's effectiveness and communication and developing a sense of creativity and commitment (Education Commission, 2000: 30). This will be achieved by following the following principles: student focused, 'no-losers'; quality; life-long learning; society-wide mobilisation (Education Commission, 2000: 36–42). While the UK vision has been driven much more by neo-liberal economic policies from both the global substructure and the political ideology of New Labour, more humanistic approaches are evident from both Finland and Hong Kong. These also reflect the prevailing culture of the countries. This brief comment on three countries' policies on lifelong learning does indicate one way that comparative studies of lifelong learning might develop and certainly one way in which comparative policy analysis might be conducted.

In contrast to these statements, national policies in Muslim countries are in varying degrees opposed to the global forces, with societies such as Turkey being more exposed to the West and therefore much more likely to be affected by the global pressures than is Iran which is much more resistant to such forces.

Regional

At the local level, it is more possible to examine practices that occur within education, at all levels, and to see the extent to which the private–public partnership has emerged: the following are but examples. Increasingly, locally based state education is being influenced by business and industry – this occurs not only in the way that the curriculum is devised and implemented, but in sponsorship of school activities and even to sponsoring whole schools. Businessmen are frequently appointed to governorships and advisory boards and schools arrange business placements, and so on, for their students. The extent to which this occurs throughout the world is an interesting and important research question.

In the same way, the development of learning regions/cities/towns is another example of the way that public and private are brought together in anticipation of enriching the community. Learning community policies and networks exist throughout the world (Longworth, 2006) with the interaction of formal and non-formal learning. Since many, but not all, policy statements on learning regions are as much concerned with the cultural factors as economic ones, they also tend to cushion the global pressures at local levels.

At organisational level the emphasis, naturally, is on the job, on the learning organisation and human resource development (Pedlar *et al.*, 1997), so that workplace learning is growing in significance throughout the world. Having said this, a number of employing organisations do release staff for other forms of education.

Resistance to Globalisation

Social pressure does not all operate in the one direction as the reference to the Muslim religion shows. In precisely the same way other non-Christian faiths, such as the Hindu religion in some countries such as Nepal (Laksamba, 2005), also operate in a similar manner. But resistance to globalisation is being seen more widely, not only through open demonstrations against it but also in such things as environmental education (O'Sullivan, 1999), wider political and academic debate, and lifestyle.

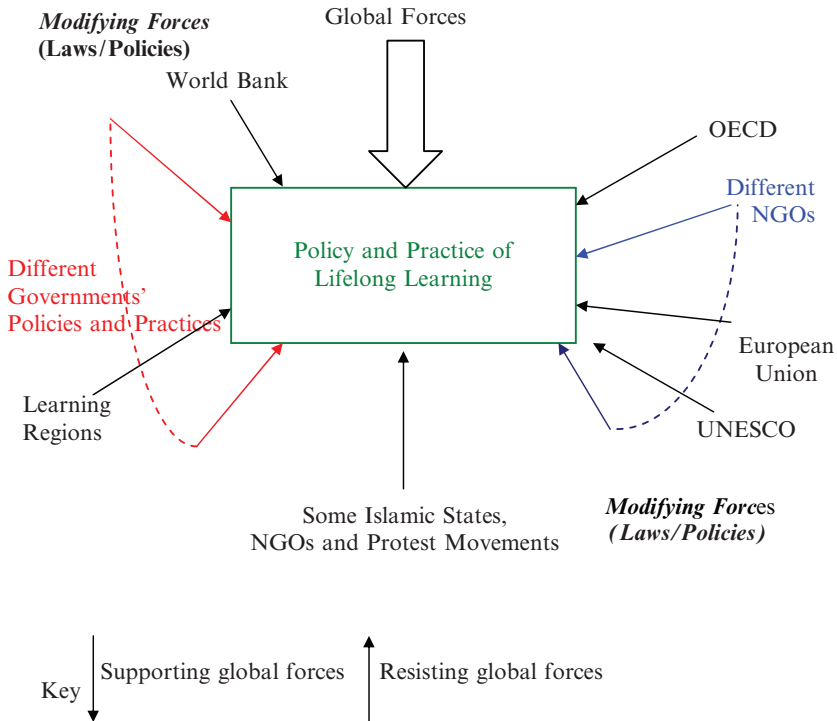

Figure 4. Forces of national institutions in the social context in a globalising world

It is possible, therefore, to detect three types of pressure operating on educational practice as a result of globalisation: the globalising forces seeking to create the form of lifelong learning that makes it the handmaiden of industry, those forces which seek through policies and practices to mitigate those forces and to produce forms of lifelong learning that are more balanced between the global capitalist and the humanistic seeking to enrich human life and preserve the environment and those which seek to resist globalisation which are currently embodied in social movements, non-governmental organisations and some religious movements. This is depicted in Figure 4 above.

Conclusion

Lifelong learning, then, presents a challenge to comparative education because it occurs in almost every country of the world as a result of similar pressures from the global core but it manifests itself in different ways. At the one end of the spectrum, both the policy and practice of lifelong learning can be seen as both the handmaiden of the global substructure as also seeking to reproduce its culture throughout the world (Bourdieu, 1973) whereas at the other it might be seen as having diametrically opposed aims.

As we pointed out earlier, the corporations that control the substructure are extremely powerful but they do not have the power to create international policies or laws and so they cannot enforce their agenda by this means. Nevertheless, some scholars (Korten, 1995; Pilger, 2003 *inter alia*) consider their power so great that they perceive them as ruling the world and if this were the case, then lifelong learning would be entirely vocational. In contrast, we are suggesting that while international, state and regional governments are exposed to these global pressures, they are in varying degrees seeking to cushion these effects and to use lifelong learning as one instrument in this process. Consequently, both the policy and practice of lifelong learning throughout the world has many similarities and considerable differences based upon the way in which they are able to respond to these global forces. For instance, the European Union has two distinct agendas: the first, of creating of competitive Europe within the global economy and so a great deal of support is given to foster the neo-liberal processes and in this sense it might be argued that its lifelong learning policy is supportive of the global pressures, but with its agenda of creating a united Europe a great deal of support is being given to lifelong learning and citizenship education, and this might ultimately be seen as a form of education that will undermine the capitalist global forces. Consequently, we can see ambivalence to the global forces in the European policy documents and practices which has its knock-on effects on the policies and practices of all twenty-seven member states – although each of these is individual, and so on. The comparative study of these policies is one approach to the comparative study of lifelong learning but it is not a comparison of its practices in different countries of the world. But without a single major provider or national structure in each country for what is generally called lifelong learning, the comparative study of its practice becomes much more problematic. Paradoxically, the less significant in national and international terms non-vocational lifelong learning of older people is much more conducive to comparative study because of its international and national structures and similar aims.

EDUCATION IN NETWORK SOCIETY: CRITICAL REFLECTIONS

Eva Gamarnikow

Introduction

The main aim of this chapter is to raise a number of key questions about the current ‘education and globalisation’ policy discourse. This discussion is contextualised in critical reflections on how the thesis underpinning Castells’ (2000) *Network Society* has been appropriated as a claim about the knowledge society and its significance in the era of globalisation. The main argument of the chapter is that *Network Society* is a treatise focusing primarily on changes in the economy, technology and work, and on the importance of the nation state, of the sphere of politics, in mediating economic and social changes. The focus of *Network Society* requires educational researchers to address issues which tend to be elided in discussions about education, namely the nature of the link between education and economy, technology and work. There is a tendency in policy sociology to treat economy, technology and work as taken-for-granted givens, occasionally under the conceptual umbrella of globalisation, whose main role is to act as a source of policy imperatives for expanding or otherwise intervening in education. The aim of this chapter is to explore the discourses constituting these sites of the policy trajectory, namely, the context of influence (Ball, 2006) of the contours and shape of education policy.

The chapter is organised in six main parts. The first three engage with the themes of *Network Society* which articulate with education policy. The following three sections are concerned with employment, education as human capital development and social mobility as key elements in policy discourses. The main focus of the argument is on the policy tensions which arise from the failure of current education policy to address the central theme identified in *Network Society*, namely its capitalist form.

Network Society

Castells’ *Network Society* is a key text in a field of sociological inquiry which is almost invisible today – a Marxist contribution to the sociology of work, critically engaging with long-forgotten debates about the relationship between technology, work and social structure. For those of us concerned about education systems and policies in the

current policy era, which places great emphasis on education as human capital development, Castells' main thesis is worth looking at in some detail.

In *Network Society* Castells develops his analysis of the current transformations in the capitalist mode of production, from its post-war, social democratic, statist, industrial society model to the current neo-liberal, global, informational form, organised around:

deepening the capitalist logic of profit-seeking in capital-labor relationships; enhancing the productivity of labor and capital; globalizing production, circulation, and markets...and marshalling the state's support for productivity gains and competitiveness of national economies, often to the detriment of social protection and public interest regulation. (Castells, 2000: 19)

What Castells is talking about is a new emergent form of capitalism, aptly described by Hutton, citing Luttwack (1998), as 'turbo-capitalism':

It is a very particular kind of capitalism that has emerged victorious from its competition with communism. It's a capitalism that is much harder, more mobile, more ruthless and more certain about what it needs to make it tick. (Giddens & Hutton, 2000: 9)

Network society is definitely not a non-capitalist economy. Its organisational and structural form has changed to informational, network capitalism, made possible by the introjection of ICT into the production, organisation and trading of goods and services, a significant portion of which is informational. What this means is that analysis of the impact of network society on education has to begin with changes in the capitalist economy and the complex relationships between economy and education.

Network Society, Technology and Education Policy

While Guile (2006) and others have noted that Castells himself speaks little of the relationship between education and informational capitalism, education policy discourses at national and international levels (Lingard, 2000; Ozga & Lingard, 2007) appear to operate with very specific, prescriptive assumptions about the educational 'needs' of globalisation. Castells' carefully crafted arguments about the complex relationships between the key features of informational capitalism – economy, technology, society and the (nation) state – are virtually absent in these education policy discourses. Here the complexities discussed by Castells tend to be reduced to variants of Blair's famous formula, 'education, education, education'. Thus the knowledge society discourse, the education policy perspective on the informational capitalism of *Network Society*, tends to focus on an abstracted argument about the role of education in globalisation, often articulated as a rather simplistic teleological claim about the 'need' for education produced by technological change. This knowledge society discourse, unlike *Network Society*, propounds a profoundly technologically determinist view. In other words,

national and international education policy silences the tensions and contradictions of Castells' informational capitalism, such as national and global uneven development, poverty, inequality and exclusion, and the importance of nation states in managing economic and social change. By linking the knowledge society to the rhetoric of globalisation, education policy tends to reproduce hegemonic, common-sense functionalist assumptions concerning technological change and employment, and immanent imperatives for more education.

There is, therefore, a sense in which the arguments of *Network Society* about informational capitalism have been appropriated by education policy and collapsed to conform to a familiar tradition of conceptualising and theorising modern societies as driven by knowledge and technology (e.g. Galbraith (1969) or Bell (1973)), and thus requiring more education. Many of these accounts are fundamentally determinist, arguing that changes in technology 'cause' changes in social organisation and mode of production. Thus because technology is identified both as a prime mover of social change and an integral aspect of the world of work, and because technology is equated with knowledge and its applications, skilling the nation by means of extending education becomes a logical policy solution.

By contrast with the deterministic discourses of education policy, *Network Society* is not only concerned with exploring both the logic of informational capitalism and/in its national 'real-world' contexts. It also explores the organic articulation of informational capitalism and globalisation, expressed in ICT technologies as symbiotically both productive and informational. In other words, ICT is both embedded in a range of computer-centred work technologies (whether the personal computer of professionals or the computerised assembly line of manufacturing), and a key mechanism for informational flows, facilitating coordination and control. ICT is thus both a feature of the work in the globalised capitalist economy as well as the technology which has made the global reach of capitalism possible, through time-space compression.

Education Policy and the Globalisation Discourse

There are significant parallels and overlaps between the ingredients of *Network Society* and globalisation, namely the crucial role of ICT and informational workers and/in the globalised economy. However, in *Network Society* the policies adopted by the nation state are significant in managing the impact on populations, making decisions about national economic strategies and priorities (such as the choice between flexibility versus social protection). By contrast, globalisation and knowledge society discourses tend to present a less optimistic view of the capacity of the nation state to influence the economic and social impact of globalisation. Here the sphere of competence of national polities tends to be reduced to education.

This fatalistic education policy discourse constructs turbo-capitalist globalisation as inevitable and unstoppable and decentres the agentic nation state, marginalising its capacity to act effectively in the economic sphere. Instead of 'protecting' against global turbo-capitalism, the government (Foucault, 1977) of the nation state claims powerlessness in the face of globalisation. This powerlessness is both external,

making anti-globalisation interventions impossible, and internal, instituting a variety of changes in and through national social institutions, especially education, by reference to the imperatives of globalisation.

Thus, education policy discourses concerning the education–globalisation link constitute education as the essential and only strategy available for nation states to cope with the challenges, demands even, of globalisation, present and future. Education becomes the main ‘insurance policy’ for individuals, families, communities, countries and regions in the era of globalisation, which is invoked in terms of known (technology and skills) and unknown (the vagaries of markets) risks and insecurities. The nation state’s government is thus reduced to educational formation of citizens for self-protection. The globalisation discourse of national and international education policy thus constructs the knowledge society as both problem and solution, with education advocated as the global ‘vaccination’.

However, the claims that education can resolve the problems of global informational societies, identified by Castells as inequality, exclusion and identity politics, is, at best, somewhat optimistic. For this to be the case, education would have to become an oxymoron – a socially neutral institution in terms of access and outcomes, but socially powerful, in order to exert influence on national and global companies, financiers and labour markets.

To assess critically the claims made for the efficacy of education as a form of protection in the global economy it is essential to explore both employment and education.

Education Policy and the Globalisation Discourse: Employment

The education policy argument about globalisation and employment is concerned with wider changes in the occupational structure and, thus, the labour market. Here the claim is that de-industrialisation in developed countries (and the concomitant expansion of manufacturing in low-wage developing countries) has reduced manual employment in the manufacturing sector, and increased non-manual employment in the service sector. These changes have resulted in an increased requirement for higher educational levels in the labour force, appropriate to the growth in higher-skill, non-manual occupations. This section explores this claim from two perspectives, firstly, the nature of the link between education and employment, and secondly, changes in the occupational structure.

There is a long-standing tradition in education policy analysis of ambiguity and opacity with respect to explicating the complex relationship between education and employment. There is a wide spectrum of positions, ranging from the optimistic ‘educational determinism’ of the 1960s, where employment opportunities are viewed as a function of the educational levels of the labour force:

There can be little doubt that the driving force behind automation is the fact that people who have been exposed to formal schooling for twelve or sixteen years have expectations in respect to work and jobs. . . . They increasingly demand jobs

in which in which they can apply what they have learned, to work with their minds. (Drucker, 1961: 19)

to Bell's new educated, scientific elite changing societal power structures:

The rise of the new elites based on skills derives from the simple fact that knowledge and planning... have become the basic requisites for organised action in modern society. (Bell, 1973: 362)

to more circumspect current arguments which see the economy as wielding greater influence:

The power shift in the direction of knowledge workers has been greatly exaggerated. Most 'knowledge' workers are only able to capitalise on their knowledge within employment. Power remains decisively with the employers. (Brown, 2006: 388)

to arguments, such as those represented in UK government policy on higher education argues for expansion on the grounds of the 'needs' of the economy:

Society is changing. Our economy is becoming ever more knowledge-based... These trends demand a more highly skilled workforce. (Department for Education and Skills, 2003: para 5.1)

In order to make sense of these different accounts of the relationship between education and employment, let us turn first to exploring employment in relation to education. The central factor here is that employment is organised and determined by specific macro- and micro-level requirements of employers, not education (Hussain, 1976). The existence of skill shortages, such as 'sub-degree... associate professional and higher technician' identified in *The Future of Higher Education* (Department for Education and Skills, 2003: para 5.12) is evidence of mismatch between employer 'needs' and the types of educated workers 'produced' by education. More importantly, however, the existence of skill shortages demonstrates that logics other than a simple availability of skills dominate decisions about employment. Thus, how employers organise and divide up discrete labour processes, how they link these subdivisions with technological capacity, and how they integrate discrete chunks of labour processes and technology with employment strategies, is dependent on the inherent logic of the capitalist economy more generally. That is the logic of turbo-capitalism. How work is performed, what the nature of the technological input is and who will do the work are factors which are dependent on profitability in the first instance, and not on educational levels. A key case in point here is the shift of ICT work to India, where similar computer skills are available at a lower cost than in developed countries. Thus employment practices are driven by employers, not by education, and these follow traditional capitalist forms – a concern with reducing labour costs.

Additionally, far from being a form of ‘insurance’ against the dangers of global informational capitalism, education and educational expansion contribute more generally to the possibility, if not likelihood, of labour-cost reduction. Education has many ‘faces’; one of these is ongoing universalisation of skills, contributing to increasing the supply of skills in the labour force. In simple economic terms, this means that education is continually devaluing its own products. Thus, mass literacy means that literacy is no longer a scarce skill. Instead it is reduced to a skill of ‘general labour’, a *sine qua non* of entry into the labour market, rather than a prized asset. The greater the supply of skills, the lower their value. ICT skills are no exception.

Moreover, this devaluation of skills operates in a pincer movement. So in addition to devaluation by ‘supply side’ education policies, the quest for profitability results in further devaluation through deskilling. This happens in two main ways. The first is when skilled labour processes are hierarchically divided by skill levels, such as educational work in schools being separated into the work of teachers and that of teaching assistants, or nurses and health-care assistants in hospitals. This changes employment patterns, substituting cheaper for more expensive labour. The second way this occurs is through routinisation: the development of protocols which reduce decision-making in skill deployment by prescribing sets of practices or ‘operations’, such as technicising clinical treatment options by the National Institute for Clinical Excellence, set up by New Labour ‘to promote clinical and cost effectiveness and the production and dissemination of clinical guidelines’ (Department of Health, 1997: 84), or the micro-level detailing and sequencing of pedagogic practices in the ‘Literacy Hour’ in English primary education (Moss, 2007). Ironically, both forms of deskilling, universalisation and massification of skills and managerial control of the labour process, are more characteristic of Fordism (Braverman, 1974) rather than post-Fordism (Harvey, 1989).

Another difficulty with the education policy narrative about the ‘need’ for education arising from changes in the type of jobs created in developed countries lies in the images of occupational reconstruction it invokes – a shift from an overwhelmingly industrial manual labour force to an overwhelmingly non-industrial, non-manual, educated labour force. While there is resemblance between actual changes in the occupational structure and the representations of these changes in the globalisation and employment narrative, they are by no means as extreme and precipitous as the narrative seems to imply. Table 1 is an attempt to provide a ‘broad brush’ mapping of the non-manual/manual divide in employment patterns in the labour force between 1921 and 2006.

Table 1 is to be read with all the usual *caveats* concerning methodological difficulties of combining different data sets, comparing over time, and so on. Identifying and charting changes over time is notoriously difficult, because differences in measurement and classification make successive data sets difficult to compare (ONS, 2003; 2006, 2007b; Marshall, 1997; Reid, 1989). However, the aim here is not to delve into the minutiae of the debates about social class and occupational ranking, but to attempt to draw a broader picture of the changes in occupational distribution. The focus here is on overall patterns, rather than specific details of classification.

The overall patterns of occupational change are highly significant in relation to the employability narrative. Thus Table 1 depicts two interrelated patterns. The first is the

Table 1. Percentage of the UK labour force employed in non-manual and manual occupations, 1921–2006

	Non-manual (%)	Manual (%)
1921 ^a	28	72
1951 ^b	37	63
1961 ^a	42	58
1971 ^a	46	54
1981 ^c	48	52
1991 ^d	57	43
2001 ^e	58	42
2006 ^e	60	40

(Sources: ^a Westergaard & Resler, 1975, pp. 293, 295; ^b Abercrombie & Warde, 1994, p. 124; ^c Reid, 1989, p. 92; ^d Kirby *et al.*, 1997, p. 121; ^e ONS, 2007a: Table 19)

shrinking of manual employment from just over 70% of the working population in 1921 to 40% in 2006, and the concomitant expansion of education-based occupations, non-manual employment. This pattern conforms to the globalisation and employment discourse. The second pattern which emerges is that this decline in manual employment and increase in non-manual employment is not a recent phenomenon, linked specifically and uniquely to the post-industrial informational economy. The occupational change from manual to non-manual employment appears to be a fairly steady, ongoing feature of the occupational structure throughout the entire period. This second pattern of continuity, rather than (the discursively implied) radical discontinuity, undermines the discursive claims that current economic forms have engendered drastic changes in the occupational structure which necessitate specific and immediate educational policy interventions.

What can one conclude about the claims made concerning the nature of employment in education policy discourses? It is clear from the argument thus far that education policy discourses which locate the need for education in the logic of globalisation, the knowledge society and so on are, at best, overstating the case, and/or, constructing a hegemonic, regulatory ‘imaginary’, at worst.

Education Policy and the Globalisation Discourse: Education as Human Capital Formation

In the previous section I argued that employment in globalised capitalist societies conforms, perhaps not surprisingly, to capitalist logic of skill devalorisation. Thus, the more educated the labour force, the less valuable educational skills become in the labour market, a key feature of which appears to be a steady increase in skilled occupations. These tensions between employment, occupations and skills are explored in this section from the other side of the equation in education policy discourses, the construction of education as human capital development.

The sociology of education policy literature has provided a vast array of work on education policy in the context of globalisation (see, for example, Burbules & Torres, 2000;

Lauder *et al.*, 2006; Lingard & Ozga, 2007), making it unnecessary to rehearse the arguments in detail. For the purpose of this chapter, the key shift identified parallels Castells' *Network Society*, namely the radical shift from the Keynesian, social democratic welfare state to the neo-liberal, post-welfarist, market-dominated and market-driven model. Thus while the previous section on capitalist employment emphasised important continuities, this part of the argument concentrates on the discontinuities.

Here, the most significant of the discontinuities in the changing policy regimes lies in the role attributed to education. In the social democratic era, education was constructed as a public good and a collective form of welfare provision, a key element of Marshall's social citizenship (Marshall, 1950). In the current neo-liberal era, by contrast, policy discourses construct education as a positional good for individuals, and as the site for human capital formation for the globalised economy. What has not changed is the importance ascribed to education.

Neo-liberal education policy discourse thus reduces education to skill formation for employability, drawing on human capital theory:

This is the 'age of human capital' in the sense that human capital is by far the most important form of capital in modern economies. The economic successes of individuals, and also of whole economies, depends [*sic*] on how extensively and effectively people invest in themselves. (Becker, 2006: 292)

Unlike in the social democratic era, when the benefits of education were more collectively appropriated and distributed, for instance through the institutions of social citizenship, neo-liberal policy discourses focus on two aspects of education: education for individual employability and for economic growth. The economic growth argument has been extensively researched (e.g. see Wolf, 2000) and suggests that links between increases in education and increases in productivity are tenuous in the extreme. Government policy (Department for Education and Skills, 2003, para 5.3), by contrast, maintains that 'there is compelling evidence that education increases productivity'. These diametrically opposed conclusions are indicative of a seriously contested ideological terrain. For if, as argued earlier, the globalisation discourse denies the nation state any real capacity for independent economic policy, then the role of the state appears to be reduced to promulgating educational opportunity to citizens. In this context, negating the efficacy of human capital development for productivity can be profoundly counter-hegemonic, undermining the legitimacy of government through education.

However, human capital development has another, more popular/populist dimension, namely the promise of individual formation for employability. From the perspective of current post-welfarist, 'Third Way' policy discourses of state and education and educational expansion represent a political reorientation of the nature and direction of welfare expenditure from social insurance to employability. Educational expansion is, firstly, an extension of compulsory education, hence a reduction in the overall labour force and a consequent reduction in visible and financially supported unemployment. So education reclassifies individuals as educational subjects and welfare expenditure as investment in employability. Secondly, employability through education also represents a shift in values. Neo-liberal education policy constructs individuals as responsible

for developing employability through education. The onus of welfare shifts from the state as the dispenser of the collective provision of Marshall's social citizenship to the neo-liberal subject who is obligated to self-improve through education. The role of the state is to facilitate the educational formation of citizens; that is its new welfare role. Thirdly, the ideological justification for this reorientation of welfare lies in the combination of policy narratives about globalisation, education and the knowledge society. In these narratives, as discussed earlier, the economic role of the nation state is constructed as limited by globalisation and free markets over which the state has no control. The main economic lever available to the individual nation state is educational formation of a desirable labour force which will attract investment and jobs. The role of education for employability is to stimulate expansion in the higher-skill end of the global labour market, since low-skill work has tended to move to low-wage economies. Thus education is both the new welfare and the new economic policy.

In view of the apparent elevation of education to such policy significance in the current era, it is vital to point to the paradox of neo-liberal educational expansion: when education is constructed as a positional good, acquired by individuals to enhance their competitive position with regard to employability, education's reproductive tendencies are enhanced. So while education policy creates 'opportunities' for self-improvement by increasing educational participation, the outcomes of neo-liberal choice policies in compulsory education are growing polarisation of achievement, and deepening exclusion and poverty.

The overall outcomes continue to be problematic for social justice and equity. Although it is still early days, it would appear that the policies have been relatively successful in increasing overall educational achievement, i.e. raising the achievement floor. Measured levels of literacy and numeracy among primary pupils have risen, as have the numbers achieving the gold standard of 5 GCSEs A*-C: in 2006, 56.3% achieved 5 A*-C, compared with around 45% in 1997 (Department for Education and Skills, 2005; Fabian Commission on Life Chances and Child Poverty, 2006). What these overall positive results hide, however, is continuing educational polarisation: underachievement is complex and diverse, but broadly reproductive. Links between social class and/or other forms of social disadvantage and educational (under)achievement have not been broken.

Thus, although the size of the educational pie has increased, there has not been a concomitant redistribution of educational opportunities. Moreover, neo-liberal choice is reproducing a social geography of successful and failing schools which reflects the social geography of poverty, social exclusion and inequality: successful schools tend to be located in wealthier areas, while failing schools tend to be located in areas of poverty and social exclusion. The current high-stakes, marketised system of education is not inclusive in its human capital formation, but polarising (Fitz *et al.*, 2007; Tomlinson, 2005).

Social and educational polarisation in compulsory education has clear implications for opportunities in the post-compulsory phase. Here, too, social and educational inequality are a key feature of UK's expanded educational provision.

Participation in post-compulsory education is socially and ethnically skewed. In 2002 young people aged 16-19 from higher-social-class backgrounds were almost 1.5 times

more likely to be in full-time education (87%) than young people from working class backgrounds (60%) (Fabian Commission on Life Chances and Child Poverty, 2006). There are further social-class inequalities evident in the type of post-compulsory education attended: overall, the lower the status of the institution, the higher the proportion of working class and ethnic minority students (Wolf, 2002). Thus Oxbridge continues to recruit very heavily from the 7% who attend private education, while ethnic minority children and those from working class backgrounds are more likely to study at the new universities (the former polytechnics) or to attend Further Education Colleges. Interestingly, ethnic minority students are more likely than whites to continue their education post-16 years, probably to counteract the ‘ethnic penalty’ of a racist labour market (Fabian Commission on Life Chances and Child Poverty, 2006; Modood *et al.*, 1997).

These social inequalities in access, participation and achievement are most evident in higher education (HE). HE developed from an elite into a mass system in the expansion which took place in the 1990s after the abolition of the binary divide, the concomitant increase in the number of universities, and government policy aimed at increasing student numbers. Currently around 45% of the age cohort attend HE, and the government target is 50%.

In addition to overall expansion, current HE funding policy is linked to government demands for the HE sector to widen participation by increasing the proportion of first-generation undergraduates from so-called non-traditional backgrounds (Department for Education and Skills, 2003). In 2000, for instance, 72% of young people from the highest socio-economic group went to HE, as against 17% from the lowest.

However, there are some important tensions in the possibilities for greater educational equality in the widening participation agenda. A key issue is the myopic focus in the employability narrative on the non-manual sector of employment and skills, and its significance for economic growth. Thus, there is very little discussion in the human capital formation narrative about the 40% or so of the labour force engaged in manual occupations (see Table 1). It would appear that the employability narrative operates within the parameters of knowledge society discourses, with their stigmatisation and marginalisation of the two fifths of the population working in the low-skill, low-wage sectors of the economy.

This marginalisation is clearly visible in government HE policy (Department for Education and Skills, 2003). Here, as mentioned, the strategy is to raise HE enrolments to 50% by 2010 from the 43% of 2003. Irrespective of the success or otherwise of the widening participation agenda, it remains the case that half of the population will be excluded from HE. This group is directed to vocational and technical courses, intended for either manual or lower-status non-manual employment. The presence of the 50% of the population, destined to never attend HE in the knowledge society thus remains highly ambivalent – included through employment but excluded by education.

Education Policy and the Globalisation Discourse: Education and Social Mobility

Enhanced opportunity for social mobility in the meritocratic knowledge society is the last element in educational policy discourse. The challenges, risks and insecurities of capitalist globalisation appear to be redeemed by the promises of human capital

formation, not just for employability, but, more importantly, for social betterment. Acquisition of skills and qualifications carries the promise of social mobility as a reward for ‘ability plus effort’ (Young, 1958).

New Labour education policy discourse focuses on equality of opportunity and ‘meritocracy’, not to equality. This perspective regards equity as the fair distribution of inequality, and identifies education as the key mechanism. Upward and downward social mobility are the indexical signs of the success of education-based meritocracy: people enter the occupational hierarchy on the basis of their own achievement and merit, expressed in educational qualifications, and not on the basis of social origins. Thus social mobility is significant site for mobilising the consent of citizens to skill formation and employability.

However, the social mobility evidence shows quite clearly that educational expansion is not having the desired, predicted effects (Breen & Goldthorpe, 2001; Goldthorpe, 2003; Aldridge, 2004). Additionally, the research indicates, damningly, that social mobility is lower now compared to the social democratic era, when political commitment to full employment and structural changes in the labour market (reduction in manual employment and expansion of white collar employment in an expanding labour market) enabled a significant amount of upward social mobility. By contrast, neo-liberalism has embraced the free market ‘flexibility’ of labour, in the context of increasingly insecure employment in an ever-deepening occupational hierarchy. Thus labour market conditions are not propitious for ensuring social mobility. In fact, it is the main features of the neo-liberal economy, socio-economic polarisation and polarised educational expansion which are identified as the two main reasons for currently stagnant social mobility:

Income inequality has risen very rapidly in Britain since the 1970s. Consequently, the number of pounds sterling separating people on each rung of the social ladder, making the ladder that much harder to climb... Second,... the expansion of higher education... disproportionately benefited people from richer families. (Van Reenen & Machin, 2007: 17)

There is, however, also a third reason for social immobility, namely the networks of *Network Society*. Educational expansion has undermined the value of educational qualifications, as previously argued, and at the higher levels of the occupational structure (and educational achievement), non-educational qualifications and attributes, as well as the social capital of networks, have become increasingly important in access to high-status occupations. At lower levels, where educational qualifications are sparser, educational qualifications continue to be more important, thereby excluding many poor and disadvantaged young people from labour market participation. This complex coupling of educational qualifications and occupational structure, together with broadly reproductive education, means that social and economic inequalities have become increasingly polarised. Thus educational policy, embedded in notions of the knowledge society as the only realistic alternative in the face of capitalist globalisation, has, thus far, failed to deliver the promised opportunities. Instead, human capital formation in neo-liberal globalised economies creates ‘the opportunity trap’ (Brown, 2006) – continuing and entrenched social and educational inequalities, with blame

deflected from the nation state by the apparent expanding openness of the educational system, where educational failure is firmly located in the individual.

Conclusion

These critical reflections on the educational policy implications of *Network Society* paint a somewhat gloomy picture of education policy in the UK. I have argued that the themes and issues raised by Castells in the idea of informational capitalism are related, in certain respects, to the education policy discourses of the knowledge society and globalisation. Unlike Castells, however, who recognises the capitalist features inherent in *Network Society*, UK education policy discourse identifies education, in the guise of human capital development, as solution, insurance and new form of welfare in the era of the knowledge society and globalisation.

It is not surprising, perhaps, that education policy has failed to live up to these promises. The promises are too many, and too burdensome for education, which has become an ‘over-determined’ (Althusser, 1969) policy site for prevention and cure of social exclusion, disadvantage and social inequality, for economic growth, for meritocratic modernity and social mobility, for insurance from the challenges and risks of globalisation through human capital formation, for. . . The list goes on.

EDUCATION AND ECONOMIC DEVELOPMENT: EVALUATIONS AND IDEOLOGIES

Eleni Karatzia-Stavlioti and Haris Lambropoulos

Introduction

This chapter investigates the relationship of education and economic development by reviewing the evolution of the relevant research field. Economic considerations regarding the value of education to human development have appeared since the ancient times (Mace *et al.*, 2000a: 2). However, there are considerable differences in the ideologies, the evaluations and the ways these considerations have been put forward at different times and by different societies (Karatzia-Stavlioti, 2005: 140–142).

After the Second World War a rapid expansion of education systems took place. There were discussions of the contribution of education to economic development. Firstly, convergence theories stressed the need for the societies to respond to the challenges of the new technological improvements (Ingels & Sirowy, 1983: 335). Then neo-Marxist approaches highlighted neo-colonialism (Wallerstein, 1974; Altbach, 1971; Carnoy, 1974). Thirdly, there were the theories of neo-institutionalism, which focused on world education culture; world culture became very important as a policy legitimization framework (Meyer *et al.*, 1997; McNeely, 1995).

During this post-war period, international organizations were strengthened by the need for world peace and social development and they contributed to the creation of a major international education discourse. Politicians invited experts from international agencies to advise on educational reforms and on how to borrow and invest money in education in order to achieve social and economic development (Wolf, 2004: 317; Resnic, 2006: 174; Mace *et al.*, 2000b: 2).

From the 1960s, human capital theory has been important (Schultz, 1961, 1963, 1993; Becker, 1964, 1993, 1995; Cohn & Geske, 1998: 30–35; Johnes, 1993: 15–18). The concept of human capital stresses the skills and attributes embodied in people and assumes that the skills may be improved through education and training.

In this chapter the link between education and economic development is reviewed and the theoretical arguments are critically discussed in an evaluative framework. Finally, how the education–economic development discourse became the basis of educational reforms and policies throughout the world is noted.

Education and Economic Development: Theories

This section investigates the ways that education was related to economic development and presents the underlying theoretical arguments. At the heart of these theoretical considerations lies the concept of human capital that was mainly treated by economists of education. The vocabulary used in the relevant works is rather specialized and technical; on this basis, any review of the field cannot avoid being to a certain degree technical.

Adam Smith (1937) in his historic book *The Wealth of Nations* is the first to identify, among the four types of capital he recognizes, the human capital; he defined it as skills, dexterity (physical, intellectual, psychological), and judgement. The use of the term in the neoclassical economic literature dates back to Mincer's article 'Investment in Human Capital and Income distribution' in 1958 (Mincer, 1974). According to Becker (1964), human capital is similar to physical means of production like factories and machines as (a) one can invest in human capital (via education, training, medical treatment) and (b) one's outputs depend partly on the rate of return of the human capital one owns. Thus, human capital is a means of production into which additional investment yields additional output. Human capital is substitutable, but not transferable like land, labour or fixed capital. While economists use the term human capital, non-economists tend to talk about the importance of the 'skills' of the workforce (Wolf, 2002, 2004: 317).

Schultz examines two related ideas in human capital theory and they need to be distinguished carefully. The first has to do with the motives for spending money on education and the other is related to human capital-creating activities (such as health). Blaug (1972: 29) believes that the concept of human capital is the idea that people spend on themselves in diverse ways, not for the sake of present enjoyment, but for the sake of future pecuniary and non-pecuniary returns. It is this notion that was attacked by Shaffer (1961).

The second idea of human capital theory is that through education and training people acquire attributes that make them more productive in the labour market. The value of this human capital embodied in them (and in societies) can be measured and can help to explain economic growth. In other words, those with more schooling or on-the-job training have incurred a cost in the form of foregone earnings. In addition, their productivity has increased which in turn results in higher earnings, assuming that workers are paid according to their marginal product. In this sense the theory produces explanations of the individual earning differences in a competitive labour market.

Since the 1960s a legitimization discourse for policies towards education advancement has been constructed on the basis of its economic value for individuals and societies. It is important to present the arguments used in the relevant debate. These may be grouped as follows:

1. *Rate of return analysis*: It is based on aspects of the human capital theory by which education is treated as an investment which might enhance productivity and yield monetary and non-monetary returns.
2. *Human resource approach*: It used the idea that through education and training specific future needs for educated workers might be planned and satisfied towards economic development.

3. *Education and economic growth analyses*: It is based on the idea that education has got a major multiplier role in economic analysis growth.

Rate of Return Analysis

It assumes that it is education that is mainly responsible for the fact that the more educated earn more than the less educated. The question of why education and earnings are so closely correlated and the other explanations offered are discussed in the relevant literature under headings such as the ‘alpha-coefficient’, the ‘screening hypothesis’ and the ‘diploma disease’ (Psacharopoulos & Woodhall, 1985: 34–39; Mace *et al.*, 2000b: 23–30).

Rate-of-return analysis is a particular type of cost–benefit analysis. It is a technique in which the costs of an educational investment and the benefits of this investment are related to each other. The rate of return of any investment project is simply the rate of interest that equates the discounted present value of expected benefits and the present value of the costs of the project. The private rate of return might be a factor that will influence pupils in their decisions as to whether to stay in education or to enter the labour market. A number of objections have been made to the technique and their importance in evaluating the work in the field is quite high. These objections fall into categories such as data constraints, cross-sectional profiles, consumption benefits, uncertainty, and whether it is education alone that causes higher earnings (the alpha-coefficient) (Wolf, 2002; Mace *et al.*, 2000b: 24–30).

The first practical problem of calculating rates of return, particularly in developing countries, is one of data constraints since the data requirements in ideal circumstances are enormous. In practice, no country has such detailed information, but it is perfectly possible to obtain enough data even by making assumptions.

Data on earnings used are usually based on a snapshot, or are cross-sectional. They, therefore, do not represent the progress of the earnings of the individual, or group of individuals, over the course of their working lives. For the near future, and in particular the period of full-time higher education, this probably does not make much difference. But for more distant periods and especially in the changing contemporary society, the difference may be considerable (Karatzia-Stavlioti & Lambropoulos, 2006: 21–30).

Consumption benefits are an important issue and whatever the proportion of spending that is incurred for consumption reasons, it should not be included in the measure of costs for rate of return calculations. In addition, spending on education may result in future consumption benefits, such as a feeling of well-being, or a feeling that the quality of life has been improved. These future consumption benefits are obviously not going to be captured in rate-of-return calculations which measure benefits in terms of additions to salary.

The uncertainty factor is becoming very important in the knowledge society (EU, 1996; Council of Europe, 2003). The expectation of being able to work or work in the same field throughout one’s lifetime is also subject to increasing uncertainty in the contemporary world. Individuals may be expected to react to uncertainty and risk in different ways, a fact that must be taken into consideration in evaluative empirical estimates.

In comparing average streams of income, it has to be assumed that the whole of the difference between average earnings is due to additional education. A moment's reflection will show that this is not necessarily the case. A number of characteristics of an individual may lead her or him higher in education and earnings. Such characteristics could be: belonging to the higher socio-economic class, having greater-than-average intelligence and ability, or possessing stronger-than-average ambition and drive. The proportion of the increased earnings of the more educated that is directly attributed to education is called the alpha-coefficient. The actual value of the alpha-coefficient is a matter for debate (Denison, 1962). It has been suggested that the effects of natural ability may be stronger at some ages, or for some categories of educated workers, than others. In this sense different values should be attached to the alpha-coefficient for different calculations (Mace *et al.*, 2000b: 25).

Apart from the above, some other problems of more technical nature exist. They are related to the use of the earnings functions in any model of cost–benefit analysis. However, the constructive criticisms to these problems have resulted in further refinements and complicated extensions of the basic mathematical model. The relative literature refers to these in the sections on ‘extended earnings functions’ (Monk, 1990; Karatzia-Stavlioti & Lambropoulos, 2006: 150–157). In these extended models a great deal of sensitivity to the human capital analyses was added.

With the social rate of returns we are measuring the profitability of society's spending on education. The social rate of return to education spending has been used as a guide to the allocation of resources, between the education sector and other sectors of the economy, and also within the education sector itself. The problems that apply to the social-rate-of-return analysis are related to the ones of the private-rate-of-return analysis. For example, the problem of data limitations will loom larger in developing countries than in developed countries. The additional problems of social rate of returns are: education as a filter, whether earnings reflect productivity, and the externalities associated with education.

The problem titled ‘education as a filter’ is related to the question of the size of the alpha-coefficient discussed earlier. Though the notion is complex, it is simply explained as the situation in which education ‘does not directly improve workers' skills and productivity’ as human capital theory argues, but merely identifies ‘workers with superior abilities and personal attributes’ (Dore, 1976: 79–99; Johnes, 1993: 18–26; Psacharopoulos, 1994: 45).

For social-rate-of-return analysis to be more valid the earnings used for this calculation must reflect the workers' contribution to output, that is their productivity. This question is concerned with the imperfections of the labour market. Certain types of labour can influence their earnings by controlling entry into the occupation (as with monopoly power in, for example, entry into the medical profession). Some employers have considerable control over buying labour (e.g. entry into the Civil Service – especially in countries such as Greece where the civil servants constitute a large proportion) (Magoula & Psacharopoulos, 1999). Also, knowledge of the labour market is not always perfect; many employers do not know how their profits will be affected by employing more qualified labour, and employees are often not well informed about job opportunities.

It can be argued that the question of the earnings–productivity relationship can only be answered by examining the operation of the specific labour market. This will obviously differ enormously between countries. If labour markets are sufficiently competitive to suggest that earnings do move up and down to reflect market forces then rate-of-return analysis will prove a valuable and valid. If earnings are not determined in this way, rate-of-return analysis is theoretically flawed and the anticipated relationship between education and earnings is not the real one (Mace *et al.*, 2000b).

It is important to distinguish the monetary and non-monetary indirect benefit (Psacharopoulos, 1994) or the externalities of education. The main point is that the evaluations of the external benefits of education would add to the estimations of the net social benefits of investment in education. What is really important is not whether education as a whole produces benefits that spill over in the society. It is clear that it does (Mace *et al.*, 2000b: 40).

The point is whether the externalities for some levels or types of education are greater than others, or whether the externalities of education are more or less significant than they are for other types of investment. Another important question is whether investment in education may help to make social investment more productive and, generally, individuals more effective in the contemporary world (Psacharopoulos & Woodhall, 1985: 54; Alahiotis & Karatzia-Stavlioti, 2006: 140–145).

Following the description made by Dore (1976: 81), there are three groups of such explanations: (i) investment mechanisms which imply that schooling does, indeed, transform people in some useful and productive way; (ii) common-cause mechanisms – ways in which the correlation between education and earnings can be traced to other factors which are the underlying cause of both, like, for example the ability of the individuals; and (iii) institutional mechanisms – ways in which the correlation can be ascribed to certain established practices (i.e. recruitment practices based on credentials), which may or may not be based on beliefs about the efficacy of the other two mechanisms (Dore, 1997).

Human Resource Approach to Educational Planning

Under the human resource approach (HRA) the factor determining educational planning is the desired growth rate for the national economy or sector of the economy. This is then translated into an educational/occupational requirement and this requirement is itself determined by technological rather than economic factors. The merit of this planning method is twofold: it enables long-term educational planning and it yields exact numbers of human power/resource required. Given these two advantages of the human resource-requirements approach (HRA) it is hardly surprising that the approach has, according to Mark Blaug (1972: 137), become ‘the leading method throughout the world for integrating educational and economic planning’. And, as Youdi and Hinchliffe (1985: 249) made clear, it continues to hold this pre-eminent position. Cohn and Geske (1998: 211) believe that the human power forecasting approach is particularly important because it has been employed so widely in the international arena,

especially by the Organization for Economic Cooperation and Development (OECD) that used HRA analyses for investment purposes.

The whole question of time lags and their importance in educational planning is illustrated in the discussion of the 'cobweb cycle' (Mace *et al.*, 2000b: 42). It means that the time lag between a decision to expand the supply of human power and the time when the new graduates are ready for employment is too long. In this way changes in 'price', or in earnings, may cause graduates or employers to overreact, and earnings will fluctuate widely without necessarily leading to equilibrium.

The point at issue is mainly not whether there are time lags, or whether these are significant. The basic disagreement is about whether the market is capable of eliminating shortage or surpluses reasonably quickly; even whether there is a need to do human power planning and to establish equilibrium in the labour market. HRA to planning comes in a number of forms according to the techniques used in the evaluating procedures (Mace *et al.*, 2000b: 41–48; Karatzia-Stavlioti & Lambropoulos, 2006: 158–166).

A synthetic method was used in the Mediterranean Regional Project (MRP). This method was applied for nine countries of the Mediterranean region; it combines aspects of other approaches and it is considered as the most deliberate and comprehensive attempt to formalize the link between educational provision and economic growth. The method proceeds through six stages. Firstly, the calculation is made of educational requirements for all sectors of the economy. The next stage is to compare this with the anticipated supply of workers with each type of educational qualification that will become available on the basis of the current outflow of the education system. The difference between what is required to reach the growth target and what will be supplied indicates the increase in education enrolments necessary to achieve the target growth rate. This calculation leads to estimates of the required increase in teachers, school buildings, educational equipment, etc.

Although there are different HRA forms they all share the characteristic of assuming that labour and the economy are linked in a rigid way that is determined by the technology of production. They also assume that wages, prices and costs are irrelevant to these links. The criticisms of the approach have been of two types. First, it has been argued that the data and techniques used have been too crude to achieve their objectives. The second form of criticism argues that better data and refinements of techniques will not produce more reliable forecasts, since the basic concepts of the approach are founded on false perceptions of the structure and workings of labour markets (Youdi & Hinchliffe, 1985: 249).

It is the latter type of criticism that needs comment here. The criticisms of the HRA, about planning, concern the assumptions made about the production function, productivity changes, occupational changes, occupational definitions, the influences of price and costs, supply effects, employer plans, and international comparisons. These assumptions are quite contrary to the ones made at the rate-of-return studies. They represent a different view of the world in terms of the specifications of the production function. Proponents of the HRA assume that it is valid to lump together all the inputs in the economy – land, labour, capital – and to work out a relationship between these

inputs and output (usually gross national product – GNP). From these calculations it is possible to say how many engineers, for example, are needed to produce a given GNP. There is, however, no theoretical justification for the use of such a production function that assumes no substitution of inputs.

The evidence available suggests there is absolutely no reason to accept the HRA assumptions of zero or near-zero substitution possibilities (Mace *et al.*, 2000b: 41–42). Technological change is difficult to predict in the contemporary world (Council of Europe, 2003). It is very important in determining the occupational distribution of the labour force; on this basis it should be taken into consideration seriously. Technological change may cause substitution of capital for labour or one kind of human power for another.

Additionally, productivity changes should be taken into consideration in any human resource forecast. The evidence available suggests that it is impossible to accurately predict future productivity changes. The occupation must be defined in terms of the tasks that are performed on the job; that is, it is necessary to have a ‘job description’ and a ‘job specification’. Questions about substitutability become questions about occupational mobility. Recent evidence given by the European Union suggests that individuals will change occupational careers more than four times in their life in the near future (EU, 1996).

The changes in prices and costs are usually ignored in drawing up human power plans; they are assumed not to influence either the demand for factors of production (e.g. labour and capital) or the supply of factors of production. It has been shown that the elasticity of substitution is greater than zero and that substitution has taken place as relative prices have changed. Additionally, there is a general agreement among economists that more fully specified models are needed for more realistic results; these models will take into consideration both supply and demand forces (Johnes, 1993; Mace *et al.*, 2000b: 42).

A common practice in human power planning is to use employers’ opinions and forecasts of future requirements. Sometimes precise figures are calculated, at other times the aggregation of employers’ opinions rather than precise estimates gives rise to claims of ‘need’. In both cases it is assumed that firms forecast their future need and have human power plans; their plans are based on detailed information for their future share of the market and for the future relative process and wages including a precise definition of occupations.

Many forecasts of future requirements for educated manpower make use of international comparisons, the assumption being that educational planners can learn from the experience of other countries about the relationship between education and economic growth. Underlying this notion is the idea that there is some international human power growth path; it accepts all the assumptions of the HRA discussed above and, furthermore, that these assumptions are equally valid for all countries. It seems hardly surprising that the empirical evidence lends so little support for the validity of this approach when it is so obviously conceptually invalid (Mace *et al.*, 2000b: 46). Yet despite all the empirical and conceptual work on this planning method, it continues to be used around the world by both international organizations and governments.

Education and Economic Growth

This section is intended to critically present the methods that have been used to establish a causal link between education investment and economic growth. The main methods used have been the production function method (Denison, 1964) as well as international comparisons and the estimates derived mainly from rate-of-return studies. The production function methods are within the ‘growth accounting’ framework as they seek to explain and quantify the contribution of the different factors of production to economic growth. The question that was explored by the economists of education is the extent of education’s contribution to growth. Of course, economic growth is a complex procedure that involves more than physical capital formation alone. Education, human skills, innovative knowledge and human resource mobility are also important factors.

The basic production equation of orthodox growth theory posits that levels of output can be explained by levels of certain key inputs (merely the physical inputs of capital and labour); it also assumes that raising the quantity of any of those will (*ceteris paribus*) raise total output (Solow, 1956; Lucas, 1988; Lee, 1998). Non-economic variables such as human capital variables have no function in the early models. Under the law of diminishing returns to scale the neoclassical models carry some implications for the economy: particularly that as the capital stock increases growth of the economy slows down. In order to keep the economy growing it must capitalize from incessant infusions of technological progress, which is ‘exogenous’ to the system. Reality implied that it is not only technology accountable for high performance outside the realm of neoclassical growth model, but other factors as well. Addressing these issues, a new paradigm was developed in the 1980s, known as ‘endogenous growth models’. This was done by broadening the concept of capital to include human capital and technology as endogenous to the system. In this sense the new paradigm is not following the law of diminishing returns and producing externalities.

This model can and has been amended in order to take account of labour force quality and technical progress (Scott, 1998; Wolf, 2004: 330). The way this equation is expressed encourages people to equate growth with the accumulation of discrete inputs. However, growth is dependent not only on quantities, but on how things are combined and interact. It is true that international organizations and, notably, politicians respond to straightforward ideas; also they prefer policies which they can implement from the centre, in a top-down, cumulative way with no intensive dealings with the complexities with which education deals (Pritchett, 1996; Wolf, 2004: 330; Cowen, 2006: 571).

Although there is research evidence (Psacharopoulos, 1994: 24) that education makes both a direct and an indirect contribution to economic growth, the chicken-and-egg-relationship between education and growth can never be fully established. Nonetheless, strong support can be found for the notion that the most likely causal link is from education to economic growth, rather than the other way around (Appleton & Teal, 1998: 1).

This latter conclusion has led to a policy of investing in education that was very strongly undertaken by international organizations and institutions today (World Bank,

1996, 1999; OECD, 1998b; EU, 2003). In a revision of the implications that investment in education has had on economic growth around the world, it is argued by the World Bank that: 'Increased understanding of the relationships among education, nutrition, health, and fertility warrants greater attention to education. . . . Education is thus more important for economic development and poverty reduction than it used to be or was understood to be' (World Bank, 1996: 92).

The Approaches and the Research

The main comparisons between countries, using either of the above approaches and the relevant empirical data are reported in this section. This review shows how such comparisons confounded the idea that more education translates into more growth and economic development, although the degree of criticisms varies among researchers.

In the 40-plus year history of estimates of returns to investment in education, there have been several reviews of the empirical results; attempts have been made to establish patterns or to draw principles (from these micro-level studies) that could be used in all countries (Johnes, 1993; Psacharopoulos, 1994; Cohn & Geske, 1998; Mace *et al.*, 2000b). After the first decade of huge investment in education, faith in economic growth began to fade in early 1970s when the oil crisis influenced established educational discourse dealing with school autonomy, decentralization and managerialism. Countries were advised to manage their resources more efficiently and effectively (Mattheou, 2002: 20; Karatzia-Stavlioti, 2005: 140).

In recent reviews (CERI, 1998; Heath, 1998; Asplund & Pereira, 1999; Psacharopoulos & Patrinos, 2002; Petrakis & Stamatakis, 2002) the classic patterns of falling returns to education by level of economic development and level of education are maintained. However, the detailed results seem to be inconclusive in terms of establishing any causal and concrete evidence on the link of education to economic development. The findings of these review studies are summarized below in order to reveal the variations that exist in both the theoretical arguments and the empirical applications. These variations are closely related to the criticisms of the theoretical approaches described in the previous section.

Firstly, there is evidence that education is a profitable social as well as a private investment. Psacharopoulos and Patrinos (2002) used six new evaluative studies and updated estimates for 23 countries showing that the private returns to higher education are increasing. They are generally found to be higher than 'social' returns. However, the evidence was based on the assumption that the higher earnings of the more educated reflect their higher productivity. This increased productivity is due to the increased education (human capital) they had acquired – that is the rather controversial issue identified in the previous section.

The average rate of return in developing countries has been found to be (Psacharopoulos, 1994; Psacharopoulos & Patrinos, 2002) considerably higher for primary education than for secondary or higher education. This suggests that top priority should be given to primary education as a form of investment in human resources. In the relevant debate it is widely accepted, even by those generally critical, that investment in

compulsory education has led developing countries to economic development (Wolf, 2004: 320). It is usually noted that, overall, the average rate of return on another year of schooling is 10 percent and varies by level of country income. The highest returns are recorded for low- and middle-income countries, but, still, they are not identical. New country estimates and updated estimates for 42 countries (Psacharopoulos & Patrinos, 2002) show average returns to schooling to be highest in the Latin American and Caribbean region and for the sub-Saharan Africa region. Returns to schooling for Asia are at about the world average. These comparisons, however, are being made crudely, because of data limitations (see previous section).

As can be seen in the tables in the Appendix, the returns are lower in the high-income countries of the OECD. Average returns to schooling are lowest for the non-OECD European, Middle East and North African group of countries. During the last 12 years, average returns to schooling were found to have declined by 0.6 percentage points (Psacharopoulos & Patrinos, 2002). At the same time, average schooling levels have increased. This should be seriously and carefully investigated and taken into consideration especially in country comparisons. Also, it is generally supported by the aforementioned estimated evaluations that women receive higher returns to their schooling investments. But the returns to primary education are much higher for men (20 percent) than for women (13 percent). Women, however, experience higher returns to secondary education (18 versus 14 percent).

Most of these views, that are similar to the ones presented by Psacharopoulos in 1994, have been challenged, especially in the 1990s, by researchers that dealt with sub-Saharan Africa. Bennell (1996) makes two points. First, the original sources do not support Psacharopoulos's (1994: 195) estimates. Second, that in so far as it ever was true, 'the conventional rate of return on education patterns almost certainly do not prevail in sub-Saharan Africa under current labour market conditions'. The second objection is also suggested by the survey of the returns to education in sub-Saharan Africa in Appleton, Hoddinott and Mackinnon (1996). In this study the average (private) returns to education suggested are substantially below those presented in Psacharopoulos (1994). This was the case for both primary and post-primary schooling, although the latter still appears to have substantial returns.

The issues addressed in similar studies (Kingdon, 1997; Behrman *et al.*, 1996) are related to the questions and problems on the specification of the earnings function (on the inclusion of cognitive skills and parental background) and on the labour market operations. The conclusion we would draw from the evidence suggests that the education variable may overstate the returns to human capital, but not by very much. It also suggests that the major influence of years of education on earnings is through its effects of cognitive skills and not, as the signalling explanation would imply, indirectly through signalling ability.

Appleton and Teal (1998) provide evidence about a pattern they find similar across all the sub-Saharan African countries and which is different from the one reported by Psacharopoulos (1994), that the rate of return falls with the level of education. They make the claim that this decline has occurred in the context of the rapid expansion of education and very low growth rates of physical capital. In such a context low rates of return on education might be expected.

The method of international comparisons with reference to human resource development and economic growth presumes that there exist world human power growth paths. This notion underlay the Mediterranean Regional Project (MRP) in which countries like Portugal, Spain and Greece participated in the late 1960s aiming at economic development through educational planning. Finally, Italy, Spain, Portugal, Yugoslavia, Turkey and Greece reformed their education systems with economic development in view taking advantage of their participation in the MRP which was funded by the OECD and the World Bank (Mace *et al.*, 2000b: 43; Karatzia-Stavlioti & Lambropoulos, 2006: 166–180).

Greece, for example, pursued specific educational reforms mainly in vocational education in order to meet the requirements set by the MRA project (OECD, 1965; Psacharopoulos & Kazamias, 1985). However, years after the publication of the MRA report, researchers in Greece pointed out the ‘asymptotic’ nature of the relationship between education and economic growth because the country had not met the levels of economic growth it was expected to through the undertaken educational reforms (Pesmazoglou, 1987).

Apparently, the current policy situation in Greece continues to be driven in similar paths. The policy discourse, however, is being carefully adjusted to the one used in the contemporary international policies. In a recent report by the OECD (2003: 31) on the promotion of lifelong learning it is written that Greece has to confront the technological development and the transition from the information society to the knowledge society. Also, it is reported that the financial assistance provided to Greece for education from the European Structural Fund (EPEAEK I and EPEAEK II) since the 1990s has been a major financial instrument for the development of human resources and employment positions. The role of both institutions, the OECD and the European Union, has been important in promoting a discourse that calls for the adaptation of the human resources to the constantly changing needs of the market (Tsakloglou & Cholezas, 2005). The quantitative targets set by the Ministry of Education plans are based on promoting economic development through education, as growth will depend on mobilizing all human resources and, more importantly, on the availability of a highly qualified workforce with the skills needed to master advanced technologies and adapt to change (Tsagloglou & Cholezas, 2005: 30).

Related to the ideas that underlie the basis of the human resource development approach is the use of the setting of quantitative goals for education (OECD, 1998b; 2005; EU, 2004) and the use of international surveys to establish patterns for educational planning. For example in Greece the Ministry of Education set the following target by 2008: access of all young people from 15 to 20 years to education and vocational training (Ministry of Education, 2001).

The issue of relating literacy to economic growth started in the 1960s. In the 1980s Hicks (Mace *et al.*, 2000b) examined the relationship between growth and literacy as a measure of educational development, and life expectancy in 83 developing countries during the period 1960–1977. He found that the 12 developing countries with the fastest growth rate had well above average levels of literacy and life expectancy. According to these results, not only do literacy levels rise with the level of national income, but the examined 12 countries have higher levels of literacy and life expectancy than would be predicted for countries of that income level on the basis of the regression between

literacy and per capita income. Further analysis by Hicks appears to confirm the existence of a relationship between economic growth and human resource development, as measured by literacy and life expectancy.

Given the radical changes that take place in the contemporary labour markets deeper investigation of the factors that are likely to influence economic growth is needed. For example, when Easterlin in 1981 (Mace *et al.*, 2000b) examined the relationship between education and economic growth in 25 of the largest countries in the world, he concluded that the spread of the technology of modern economic growth depended on the greater learning potential and motivation arising from the qualitative development of formal schooling (Guena & Elgar, 1999; OECD, 2006, Cuhna & Heckman, 2007).

A study carried out in the United States by Ishikawa and Ryan (2002) uses data from the National Adult Literacy Survey to examine the relationship between schooling and earnings. Basic skills are divided between those acquired through schooling and those acquired elsewhere. The study finds that, for the most part, it is the substance of learning in school – the accumulated human capital – that counts. However, these studies did not go any further to investigate which parameters of schooling are the most effective in human capital investment and in which way. Nowadays, the Program of International Student Achievement (PISA) of OECD (2005) evaluates literacy across countries. Comparisons based on the PISA results are used in discussions on the effectiveness of the various educational systems sometimes in a quite uncritical way (Wolf, 2004: 320; Karatzia-Stavlioti, 2005: 145).

The effect of human capital in the growth of countries that exhibit significantly different levels of development was recently reviewed in a study by Petrakis and Stamatakis (2002). The authors discussed prior research and concluded that overall most of the growth literature and the empirical work about human capital would lead firstly to the fact that economies with a larger stock of human capital experience faster growth and, secondly, that investing in schooling is a prerequisite for the creation of human capital which, in turn, generates ideas and promotes development of new products (Romer, 1992; McMahon, 1998).

The empirical work by Petrakis and Stamatakis (2002) attempts to uncover differences between OECD developed market economies and less developed countries (LDC). The empirical findings of the cross country data sets suggest that the link between education and growth varies as a result of different economic development. They also suggest that primary and secondary education seem to be more important in LDC nations, while growth in OECD economies depends mainly on higher education. Their findings indicate the structural differences in the way that educational investment relates to growth between OECD and LDC. This finding is consistent with the points made earlier on the need to investigate the specific labor market before applying any kind of human capital analysis and evaluation.

Evaluation, Discussion and Reflections

In this section the discussion focuses mainly on the ways in which the link between education and economic development was used and supported empirically. Additionally, reflections are offered on the applications of the specific link made by the politicians

and the international organizations and institutions on relations between education and economic development. In this way the effectiveness of the work undertaken in the field is evaluated and the underlying ideologies may more easily be identified and reflected upon.

After the initial outburst of human capital studies in the 1960s and the crisis identified in the 1970s, in the 1980s a rise in earnings inequality was experienced in many countries. This crisis led to renewed interest in estimates of returns to schooling that usually relate to other social benefits of education such as the promotion of equity issues (Becker, 1993; OECD, 2004; Tsagloglou & Cholezas, 2005). Theories tended to capitalize the individual characteristics that relate to education under headings such as ‘social capital’ (Coleman *et al.*, 1966) and ‘cultural capital’ (Bourdieu & Passeron, 1977).

In this framework, education is no longer considered simply an engine of economic growth. It has become a means of reducing poverty and promoting sustainable development. Such initiatives have been undertaken by the European Union. They stress the role of education in making of Europe into a competitive market space with social cohesion (EU, 2003; Karatzia-Stavlioti, 2005). It is clear that education could be found at the basis of any economic, social or cultural initiative or goal (UNESCO, 1996; Alahiotis & Karatzia-Stavlioti, 2006: 140–145). However, those who use this kind of discourse do not refer with precise evidence to the need for promoting the quality of learning in classrooms and schools – learning of the kind that would assist individuals to maximize all their gains from education. More precisely, they do not offer institution-based analyses on how to ‘educate individual personalities for (any kind of) growth’.

Research, as reported in the previous section, indicated that the stock of human capital varies widely among countries and the means used to measure it are not necessarily correlated. For example, some countries with high aggregate attainment have low literacy rate and vice versa. Therefore, it appears that different countries’ educational systems vary in the degree to which they give their students the tools for life. Looking at the empirical studies it is obvious that there is little variability in the findings regarding the beginning levels of education; there is a wide dispersion in investment in higher levels of education. In particular, the mix of public and private investments in education fluctuates widely across countries (World Bank, 1996, Petrakis & Stamatakis, 2002); also there is evidence that the large discrepancy between the private and social returns to investment in higher education has some bearing on financing policy (Hasan, 2004; Psacharopoulos & Patrinos, 2002). Evidence on the rate of return suggests that a shift of part of the cost burden from the state to individuals and their families is not likely to be a disincentive to investing in higher education, given its present high private margin of profitability.

In all countries, educational opportunities seem to be concentrated among the younger, more economically advantaged of the populations (Tsagloglou & Cholezas, 2005; Argy, 2006). This means that social and equity considerations in policymaking which relate to education cannot be easily separated from economic ones. This is obviously related to the ways that education promotes economic development as well as to the quality of such education; a point that may influence the ways investment in education should be made.

The problem related to the limitations in the existing data used in human capital evaluations needs to be faced more systematically in the future so that empirical work could become more reliable. Firstly, broader measures of the stock of human capital need to be developed, allowing research to move beyond using educational attainment as a proxy. Using other measures such as life skills fluency or competencies that could include the cultural and behavioural results of education would allow a more inclusive and holistic measure of productivity and personality gains. In such a case researchers from various disciplines need to cooperate. Secondly, the aggregate and macro-level data need to be supplemented by micro-level data in order to gain a better understanding of private costs and returns. At the same time the mechanisms by which education contributes to economic prosperity and social welfare in general will be revealed. Also, improvements in data collection and design will allow governments and researchers to investigate more fully the differential impact of policy initiatives on various groups within their populations.

A large body of literature as described in the previous section suggests that systematic changes in the production process in the contemporary economies have led to changes in the demand for certain types of labour that acquire certain types of skills and competencies. This question has often led to decisions regarding the vocationalization of the curriculum, adult education, and lifelong learning. Such changes in the labour market demands are associated with knowledge-based societies. In such societies, knowledge is considered the most important input to economic development in two ways: (a) in the general sense (general basic education) as a basis for any further specialized productive academic or vocational training and (b) in the specific sense (university and upper vocational and technical education) as generating new knowledge and promoting science and technological interventions that create economic growth. These arguments are widely used nowadays by national policymakers and international institutions.

Summarizing the above review, it could be stressed that the policy issues surrounding human capital accumulation are important because human capital investments account for a large share of national outcomes. There are considerable social returns to this type of investment mainly related to the externalities of education. The findings of the aforementioned studies show that human capital is not distributed equally among or within countries. These observations lead to future research issues that should be taken into consideration.

More specifically, there is a need for defining and achieving 'adequate' levels of human capital investment. Also there is a need for deciding upon the appropriate distribution of costs between the private and public sector, especially in the case of vocational education and adult education. Careful consideration should be made in allocating resources relative to these costs in a way that could be considered socially and economically 'right'. Deeper investigation must be carried out towards achieving equitable distribution of investment spending. It is important to focus on investigating the ways by which a specific education system may contribute to economic development. Also there is a need for developing a system whereby education investment outcomes (economic, social, cultural) are accurately defined and (if possible) assessed in a combined and holistic way.

A very important area that deserves more research attention is the relationship between human and social capital and, even cultural capital. Questions also arise as to why these different capitals should be separated, as if individuals were not whole personalities. These questions are more important today than research in various fields, even neuroscience, claims that we should hold a holistic approach to human behaviour and consequently to learning.

The questions that future research would address should move further from just measuring human capital stocks and education's contribution to economic growth; they should address issues that relate to the complexity of education as well as to the variety of its outcomes. Such issues could be whether societies characterized by a greater level of social cohesion have a greater rate of return of human capital accumulation than less cohesive societies or a question could be asked about the relationship of democratic values acquisition and practice to education – including what kind of education.

To conclude, if education is to achieve all the cognitive, behavioural and social goals it has, more applied research work is needed with the cooperation of researchers from different fields. Education and its outcomes are complex and complexities cannot be understood in a simple and single way. Theoretical issues of an interdisciplinary nature and more complex empirical works are very important and cannot be ignored. Research in this important field must be planned, applied and followed up in a holistic and more systematic way.

EDITORIAL INTRODUCTION

Elaine Unterhalter

The chapters in this section all engage with issues of postcolonialism and education illuminating some of the contestations that have marked the emergence of postcolonial theorising.

At least three meanings of postcolonial are suggested. Firstly, the term invokes the analysis of states and societies that have emerged from colonial pasts and that are struggling with these legacies to mould new forms of education. The chapters by Chisholm and Leyendecker on sub-Saharan Africa and by Ramachandran on India are both examples of work that considers some of the limits on the achievement of postcolonial aspirations in education.

A second meaning sees postcolonialism less as a historical moment and more as a condition of understanding. It is concerned with subaltern voices, with invisibilities and with silences and the ways in which the experience of postcoloniality may or may not be known. In this work education is a process of fragmentation, mixing, negation and affirmation. It entails struggling to find new languages and new forms for school knowledge. The chapters by Sharma on hybrid experiences of education, Rampal on indigenous knowledge, Bhana/Morrell/Pattman on gender, Parkes on researching children's experiences of education and violence, and Carrim on subaltern insights on the discourse of rights all consider postcoloniality as a process of negotiating identities in and through education.

A third meaning considers postcolonialism as an affirmation of a particular view of citizenship that enhances meanings of equality and justice. The chapters by McCowan/Gandin on Brazil and Unterhalter on development theory consider issues of citizenship and equality.

A number of the chapters in this section exemplify some of the features of new forms of knowledge construction associated with writing in a postcolonial frame. Thus a number of writers (Ramachandran, Rampal, Sharma) take their own personal experience as an important resource for the analysis they make. Many (Ramachandran, Carrim, McCowan/Gandin, Bhana/Morrell/Pattman, Unterhalter) make clear a commitment to normative ideas about equality or rights, while others (Chisholm/Leyendecker, Parkes) explore the limitations of existing bodies of literature in their field. The diverse positionings of the authors in relation to the theories they review and their analysis of data are also typical of this area of inquiry where the boundaries of a new paradigm are not firmly set and there are no orthodoxies regarding epistemologies and methodology.

The mutability of meanings of postcolonialism used in this section is intertwined with a range of views with regard to postcolonial theorising. Thus Sharma and Carrim work very closely with some of the canonical ideas regarding subaltern voices and hybrid identities examining their salience in education settings. Other writers take elements from postcolonial discussions, such as descriptions of the state or of subjectivity, and weave them into a multifaceted analysis, which is sometimes critical of postcolonial positions.

Many of the writers working with postcolonial theory in literary studies and history come from a background marked by migrations, most notably Gayatri Spivak, Stuart Hall and Homi Bhabha. The authors in this section are no exception. Their autobiographies are marked by migrations between countries for work (Unterhalter, Sharma, Pattman, McCowan), between attachments to universities in different countries (Bhana, Rampal, Gandin, Parkes) and between multiple sites for intellectual work. Thus Chisholm, Rampal, Ramachandran, Morrell and Unterhalter have all worked both in universities and as advisers to governments and multilateral agencies.

The complexity of professional experience of writers working with postcolonialism was a feature of the work entailed in generating the texts in this section. While some have been written in a clear academic voice drawing on conventions of the genre, others have been developed from discussions or personal narratives. In editing the chapters I have tried to keep some of the texture of the genre in which they were initially developed.

The concerns which are central to postcolonial framings of education are those of identity and language, the formation and reformation of postcolonial politics and polities, postcolonial terms of discursive contestation, shifts in the nature of the State and new theories of rights. The perspective on education notes violence, inequalities, and unfulfilled aspirations. Nonetheless, many of the chapters posit research agendas, conceptual openings and pointers to political strategies for educational change that express high levels of aspiration for a postcolonial project, not currently realised, but somehow immanent in ideas, social relations and contestations currently underway.

REFLECTING ON POSTCOLONIALISM AND EDUCATION: TENSIONS AND DILEMMAS OF AN INSIDER

Vinathe Sharma-Brymer

Introduction

We were not using English language anywhere around us except for school. So I faced this dilemma – why were they forcing us to learn this language which was not practically used in my life. I was told that English would be the medium of instruction in college. But I asked myself can't we continue our education in our own language? Why are these people forcing us to learn this language? I developed an aversion towards English language from the beginning. I also had this inferiority complex about this language. Even today I hesitate to speak in English. (Nirmala, 38-year-old Indian woman)

Two very different perspectives are evident in contemporary educational goals. One focuses on creating a trained workforce to adapt to the needs of industrialisation; here education links with economy. Another seeks to enrich a learner's quest in relation to self and identity. Both create tensions and dilemmas in a learner in a postcolonial society. Understanding and addressing the educational experiences of these learners in present times demand a particular sensitivity towards 'educated hybrids' and 'dislocated migrants'. With particular reference to gender and feminism, Chandra Talpade Mohanty (2003) places the onus on creating sensitivity through pedagogy to understand these complexities:

My recurring question is how pedagogies can supplement, consolidate, or resist the dominant logic of globalization. How do students learn about the inequities among women and men around the world? For instance, traditional liberal and liberal feminist pedagogies disallow historical and comparative thinking, radical feminist pedagogies often singularize gender, and Marxist pedagogy silences race and gender in its focus on capitalism. I look to create pedagogies that allow students to see the complexities, singularities, and interconnections between communities of women such that power, privilege, agency, and dissent can be made visible and engaged with. (Mohanty, 2003, p. 523)

Her views have resonance for thinking about education and postcoloniality generally, reaching beyond questions of gender.

Postcolonial approaches to education have an emphasis on exploring complexity, dissent and hybrid strands of the learner's experiences. They encourage educational theorists and practitioners to view a wide canvas and urge them to pay particular attention to the nuances. The theorist and practitioner must thus use a different set of lenses to expose diversities in the learner's experience of power, control, identity, self-awareness and the complexities involved.

In this chapter, firstly, I discuss postcolonial theory and education considering how to address, approach, study and understand the voice of the learner as the Other. The Other is all around us – she is an educated, university graduate from Sri Lanka struggling to express her thoughts in English language in an Australian university; he is an Indian IT consultant living in California, making his best effort to find a 'place' in the white community; he may be an African youth struggling with a dilemma about following his parents' cultural habits at home. In my discussion I illuminate some of the tensions showing how they are woven in with any approach to considering postcolonialism and education. These tensions are heightened by the diverse effects of globalisation. My main focus throughout this chapter is on presenting the voice of the Other. In my concern to reveal the 'postcolonial' Other (Tikly, 1999), I present ideas about what is lost and what is gained in the process of becoming a hybrid in globalised times; how 'hybrids' are trying to relocate themselves (or maybe have already had it done for them) in a third space at 'home' and 'abroad' where neither is stable or given; the tensions and contradictions in experiencing that third space of dislocation and search for connection is a challenging education project (Bhabha, 1994; Das Gupta, 1999).

In the next section I narrate the story of a marginalised person whose lived experience is etched with the influences of postcolonialism and globalisation. This is an insider's story that registers the achievements, yet also the anguish, of educated transition. It is the achievement and anguish of a third-world, middle-class woman who has benefited from her formal education, yet is aware of the conflicts and contradictions intertwined with this and its impact upon her identity. This narration is concerned with commenting on the continuing impact of issues of culture and language in Eurocentric educational systems. I will draw on narratives from Indian educated women's experiences of education collected in Sharma-Brymer (2007).

An Insider's Understanding on Postcolonialism

Postcolonialism "addresses the effects of colonization" (Hickling-Hudson, Matthews & Woods, 2004, p. 2); it is a process that reviews and explores the "structure of inequality" (Loomba, 1998, p. 18), also implying that the effects of colonialism that are continuing even in the present could be explained by pointing out the dilemmas and conflicts involved. Exclusion, domination and resistance have shaped the relationship of power and knowledge and influenced understandings and representations of the world (Bhabha, 1994; Said, 1978). Postcolonialism is deeply engaged with reflecting on the work entailed in the construction of the Orient as discussed by Edward Said (1978).

He showed how the Orient was constituted by Orientalist knowledge systems which entailed political and economic supremacy. The construction and representation of the Orient maintained Western ideas, imagery and words, thus reflecting a particular set of beliefs associated with a particular formation of power.

The new formations of power associated with globalisation generate contrasting assessments. Some researchers mention many positive aspects of new technologies (Crossley & Watson, 2003; Tikly, 2001). Writers on adult education report that international adult educators are “comfortable in transcending boundaries of race and class ... knowing that their identities are never stable” (English, 2003, p. 68). But critics of globalisation point out negative effects including the dislocation of peoples through migration, exclusion and discrimination, misinformation, and the way in which capitalist empires are selectively ignorant of cultures (e.g., Roy, 2004). Development of dams, bridges and the expansion of cities lead to mass dislocation of people. The owners of giant corporations often ignore the existing cultural wealth of people and distort their rich local knowledge. In ‘developing’ populations using Eurocentric education seems to silence their inner voice. Gayatri Spivak (1996, p. 293) states:

It seems to me that finding subaltern is not so hard, but actually entering into a responsibility structure with the subaltern, with responses flowing both ways: learning to learn without this quick-fix frenzy of doing good with an implicit assumption of cultural supremacy which is legitimized by unexamined romanticisation, that’s the hard part.

A postcolonial approach to education considers how aspects of education, irrespective of levels of literacy and outcome, affect the learner’s self-awareness and growth. It illuminates an individual’s lived experience. This offers a rich arena to analyse the location of the individual in a past and present social, historical and cultural context. It allows the theorist/practitioner to reflect critically on such phenomena and to interrogate the dilemmas that power and empowerment webs create. Interrogating critical aspects allows the theorist/practitioner to illuminate voices. In conditions of globalisation commitment is needed to listen to marginalised voices (Spivak, 1999).

For a person like me, experiencing both the positive and negative effects of postcolonialism and globalisation, these processes are both an anguish and an achievement. I affirm the importance of listening to the Other and responding to increasing complexities. The contexts of economic exploitation, social marginalisation and cultural domination have undergone huge changes in the last decade. For some, change has been positive, enabling them to realise dreams that were suppressed in their parents’ generation. For others, dreams have led to dilemmas and conflicts. An analysis of postcolonialism is enriched by stories of many Others. Stories register their anguish and achievement; they reveal contradictions in being an educated citizen and a participant in a traditional system. Addressing this moves a researcher beyond boundaries and borders, dichotomies and preconceptions (Parekh, 2000). Postcolonial analysis no longer needs to be restricted only to exploitation and powerlessness (Hall, 1996), rather it needs to unravel how

economic, political, social and cultural processes of exploitation are perpetuated alongside efforts striving to dismantle colonialism (Loomba, 1998).

A number of critiques hold that colonisation is not solely Western or the outcome of imperialism (Ashcroft, Griffiths & Tiffin, 1995). For example the numerous political and cultural invasions which have taken place in the Indian subcontinent have repeatedly colonised indigenous communities. India, although at present, politically unified and democratic, is still a boiling pot of many internal conflicts. For example, the tribal communities in the north-east Indian states experience exclusion, separation and acute exploitation of many forms (Devi, 1995). A postcolonial analysis probes into issues of dominance, power and control among and within non-European elites. It looks at how they discriminate against other groups, deploying caste, class, gender and ethnicity. Dominance and power are often related to control over education systems. But postcolonial analysis is also concerned with Western domination, its global spread, complexity and capitalist influences on the value systems of colonised societies. However, once again, the dilemma of a postcolonial insider is whether to keep traditional values or to compromise and adapt to the changing ways of the contemporary, multicultural world (Parekh, 2000).

These dilemmas point at another critique sometimes levelled at postcolonial theorising: how can generalisations that arise from discourse analysis do justice to the experiences associated with different cultures, geographical regions and different languages? For example, can India, Africa and Australia be approached using the same analytical lens? Any attempt to classify these very different postcolonial countries will be inaccurate. The experiences of peoples from postcolonial countries are as diverse as the effects of postcolonialism. Thus, researching effects, exploring commonalities and engaging with specific stories are a more generative approach for a postcolonial researcher than developing generalisations. The effects of postcolonialism in African countries in terms of inequities of power, poverty, geographical dislocations and disruptions in social relations are widespread, as are the effects of modern education on local cultures in India, Sri Lanka, Australia, Africa and Southeast Asia. Yet, despite these similarities there is a need to listen to the Other in each country. Stories of complex experiences may be unique but they reveal deeper layers and give voice to hidden concerns with class, caste, gender and race (Pieterse & Parekh, 1995).

A postcolonial perspective takes interest in studying socio-economic divisions and inequities associated with control over knowledge, constraint on access to education, and the dominance/power resulting from such controls. Thus dissemination of work where science is written as the history of Western advance and history is seen as an account of the successful rise of capitalism and colonialism is associated with discrimination and oppression of the Other (Said, 1978). This is evident in recent writing on environmental conservation and awareness where indigenous communities' multiple literacies and concepts of harmonious living have been little understood (Devi, 1995; Sharma, 2002; Smith, 1999). Postcolonial approaches suggest we have to examine diverse factors in the past and the present to analyse how knowledge is appropriated and denied. Thus a postcolonial researcher exposes tensions, dilemmas and contradictions with regard to education and change.

Postcolonialism and Education: Tensions, Contradictions and Dilemmas

One dilemma for a person from a third-world country is finding the 'proper' ethical way of appropriating the knowledge acquired from the Western educational model. Is he or she to celebrate formal educational qualifications and an upward mobility or to reflect on what has been lost in that process? If they reject the Western model what other choice is available? How good is this choice for a person who wants to cross the border of states, provinces and nations or even to move beyond the language boundary of their local language to access information presented in the global language of English? Do we need to feel enraged about the injustices committed by the colonial rulers against our country or do we swim with modern education and its benefits? Must we respond to the internationalisation of education or remain excluded from better material opportunities that modern Western education leads to? Dilemmas are intertwined with everyday life for educated people in low-income countries leading to several layers of contradiction.

The framework of social power relations and resource control mechanisms which colonialism reinforced has resulted in continued discrimination against people of certain classes, caste, ethnicity and women with the denial of their basic rights. Researchers have analysed racial dominance and gender issues, illuminating the postcolonial voice, with observations on globalisation and internationalisation and considerations of how to interrogate and respond to 'development' (e.g., Mohanty, 1990, 2003; Sharpe, 2003; Spivak, 1999).

Women within patriarchal structures have been subjected to multiple layers of subjugation. Their struggles, inner tensions, conformity and resistance, conflicts and contradictions are related to multiple identities. Their experiences, when interpreted through a postcolonial lens, reveal the movement of minds, person, self and identities. The 'in-between' moment reveals the influence of modern education on tradition and culture. The struggle of a person receiving education, standing at the confluence of a colonial education system, their own culture and globalisation illuminates how hybridity is created and how identity migrates from local to global.

In the following section I elaborate on educated women's experiences, taking these as the focal point to discuss aspects of education in postcolonial times. I draw on educated Indian women's narratives taken from a broader phenomenological study I conducted (Sharma-Brymer, 2007). My intention is to use the lens of a postcolonial 'insider' to interpret the hybrid educated woman, expected to receive an education and thereby become 'eyes for her family'. There are positive shifts in her movement to the public sphere. However, a shift in her location does not mean she is empowered, an effective decision-maker or a person in control of her life. What is evident is the nature of her multilayered experience associated both with improvements in material conditions and increased conflicts.

Women, Education and Participation in Postcolonial Societies

While many argue that modern, Western education is needed for women's voices to be heard, often linking this with calls for concerted work on women's and human rights

(e.g., Afshar, 1998; Fox, 1999; Ghosh & Talbani, 1996; Heward & Bunwaree, 1998; Howell, Carter & Schied, 2002; Kabeer, 1999; Stromquist, 1998; Unterhalter, 2000; Wazir, 2000), the claim is also made that education makes no difference, to change women's life conditions (e.g., Bhasin, 1994; Longwe, 2001). Sarah Longwe (2001) is a strong voice from Africa discussing the outcomes of modern education in women's lives. She observes that educated women conform to and benefit from patriarchal systems. In taking senior positions in government they reinforce female subordination. She calls them the 'honorary members of a male club', showing how they discriminate against grassroots women activists:

The purpose of schooling is to inculcate girls' acceptance of the 'normality' of male supremacy ... to believe it is 'traditional' and 'natural' for their role to be confined to rearing children, looking after the home, and supporting their husbands. (Longwe, 2001, p. 68)

The striking demarcation between schooling and education, as Longwe notes from her studies of adult education in Zambia, is what is believed and practised. Calling for a change, Longwe underlines that "women's education for democratic governance needs to be concerned with *unlearning* (my italics) all the undemocratic and oppressive messages that were implicit within the beliefs and attitudes inculcated during schooling" (Longwe, 2001, p. 71). This call for *unlearning* contrasts with demands for an expansion of education.

Two questions flow from Longwe's critique. First, are there forms of education that have the potential to raise awareness and knowledge levels, even if this is not always realised in practice? Second, can basic literacy or basic education empower women to participate better and be equal citizens? There is no agreement on these points. Thus Nelly Stromquist (1990, 1996, 2005) emphasises the outcome of literacy in advancing awareness and knowledge levels; but many activists such as Bhasin (1994) show this is not uniformly the case. Further research is needed to explore what knowledge educated women gain from their schooling and what meaning they are making from their education as adults. This exploration coincides with Elaine Unterhalter's concern to listen to the personal accounts of individual women (Unterhalter, 2005).

Two educated Indian women's accounts show up these contrasts. One woman supported the view that education has enhanced her life. Another pointed out the influential role of tradition and limitations on her agency:

We can do everything, whatever we want to ... we have the courage, confidence ... this courage comes from education. If you don't have education, you don't go out, you sit indoors all the time. (Rani, 36-year-old lecturer in Physics)

So I was a bit over-conscious of our life, hardships.

There was contentment, satisfaction ... I was proud, happy.

I became determined to do something more in my life and alter my life style, get education, get a job, become somebody noticeable...

Yes, I did oppose. I opposed, said I didn't want this marriage. I didn't want to marry my own brother-in-law. But I had to respect elders.

You know, the saying is why worry about spilt milk?

I am not demanding, don't expect him to fulfil any of my desires ... I have learnt to laugh away my miseries. (Vinoda old high school teacher)

The outcomes of education are very diverse and aspirations from education are not uniform. In an earlier study looking at mothers in a rural area in India it was evident that most felt their daughters needed to be educated. However for various personal, economic and social reasons these girls could not go beyond upper primary or secondary school leaving certificate level (Sharma, 2001). Their interest in schooling their daughters was linked with gaining social prestige or negotiating a groom from a better-placed family. But economically disadvantaged families, living in semi-urban and urban areas, encouraged their girls to achieve at least the secondary school leaving certificate in order to get jobs in factories with better payment compared to the low daily wages that people receive in rural areas. Economically more prosperous families tend to encourage further education, including university degrees, to enhance their girls' status in society and to widen their opportunities, particularly with regard to marriage (Chanana, 2001). Thus urban and semi-urban people tend to view education for girls as positive for employment and marriage prospects, rather than for empowerment in psychological or cognitive areas of development as discussed by Stromquist (1996).

But examining what is gained through schooling and what is internalised as opposed to the proclaimed outcomes of education (personal development, formal subject knowledge, world view and equality) seems to be necessary for any studies that interrogate women's experiences of being educated.

Some of the voices of postcolonial educated women confirm this. Nirmala reveals how conflicted her own educational experience was, and how she is now trying to ensure a better learning experience for her daughter. Contrastingly, Rani and Vinoda talk about the positive outcomes from their own education:

Whatever was lacking in my education, in my life, I am trying to fill those gaps, improve myself and give my daughter whatever she needs for her development. What I came to know in my degree days, she knows all that even in her Class 2 and 3. (Nirmala)

... whatever you read you learn something from that ... I am satisfied that I am using what I studied for the good of my life. (Rani)

See, all this knowledge, awareness about women's condition, history ... all this came from my education. (Vinoda)

But Rani in another extract narrates her subjugated position:

If a woman is unmarried that becomes the biggest failure in her life. My own brothers don't give me respect because I am not married yet. When I bought my two wheeler they said why did I want a vehicle, what would I do with it ... I didn't have a husband or children. These are the only times when I feel very sad and think why did I get so much education. (Rani)

There is not a consensus on how women's knowledge has or has not been addressed through education. Extracts from two narratives reveal different perspectives:

I think of my children and husband first and go according to their needs; hardly an hour or so I keep for myself, for my own things. That is life's reality. (Nirmala, non-working woman)

He said, 'Do whatever you want to. I will give you complete freedom. But only after you have fulfilled your duties at home. Look after my parents well, you don't need to go to a job.' I have learnt a lot from him. I am happy that with my education I can stand up to his expectations. (Deepa, non-working woman)

These different perspectives are echoed in the literature. A group of writers reviewing women's and gender studies in English-speaking sub-Saharan Africa, Ampofo, Beoku-Betts, Nijambi and Osirim (2004) state that African feminist scholars and activists are sensitive to the impact of imposed formal educational systems under colonialism. However, they also note the effects of gender discrimination at various levels of schooling in current times such as access, retention and completion; curriculum content; the feminisation of certain fields of employment; and issues of sexual harassment. They point out that some researchers studying women and gender issues "argue that with the development of state-coordinated initiatives to promote gender and development, these programs might lose their political force and end up servicing mainstream or conservative gender training and advocacy" (p. 698). Even with affirmative programmes, "education does not translate into equitable positions for women in the labour market" (p. 698). In other words, education does not necessarily improve women's chances in the public sphere.

On the other hand, writing about the Universal Basic Education programme in Nigeria, Okiy (2004) emphasises the positive link between education and greater female participation in national development. She states that the poor attitude of society to the educational development of female children is the causal factor of their poor participation in national development. She concludes, "the programme will produce educated women who have imbibed the reading culture through their use of school libraries ... thereby creating the necessary vehicle for accelerated national development" (p. 48). This statement seems to support the widely used public slogan in India, that an educated woman enhances a country's well-being. An interesting issue that emerges from reading the above observations is the confusion between what girls and women are expected to experience and what they actually experience.

To make women's experiences important and significant and to retain their distinctiveness in postcolonial societies is a challenging task. Gail Kelly (1992, 1980) stressed the need to explore the particularities of women's educational experiences rather than generalisations. Researchers such as Mohanty (1991, 2003) have questioned the hegemony of Western feminist scholarship with regard to the lives of third-world women (also see Afshar, 1998; Heward & Bunwaree, 1998; Jayawardena, 1986; Thiruchandran, 1999), while Bell Hooks stresses the significance of the intersections of race, gender and class in researching women's lives (Hooks, 1994).

While education in postcolonial times is seen to bring reforms in public life, there are arguments that education does not change women's second-class status (Bhasin, 1994; Ghosh & Talbani, 1996; Ghosh & Zachariah, 1987; Longwe, 2001; Reddy, 1991; Singh, 2002; Talbani, 2001). Yet an educated woman, when she is employed, is viewed as an asset to a family. An educated woman's multiple roles as a wife, mother, employee, good family manager/builder can be appreciated. This image of an educated woman is contradictory, which raises critical questions about agency and self-expression:

They wanted a girl to be a housewife. If a wife is good, if she is educated, adjustable, peace is maintained, harmony is there. These are important. Something for a job, a lot for our family, children, very less for us ... that is what I am as an educated woman! (Kanaka, 42-year-old school teacher)

In contemporary India, a promotional slogan related to girls' and women's education is 'a learned woman is the community's eyes'; she is a wealth for her family and nation. National educational policies have introduced positive changes for enhanced participation of girls and women. Nevertheless, it is commonly argued that female education which contributes to national progress has still not been achieved (Guha, 1974; PROBE, 1999; Sen, 1999, 2005; Wazir, 2000). Gender equality in education remains elusive; even educated women occupying high positions in universities have less power than their male counterparts, and they operate in an environment that restricts their authority (Chanana, 2001, 2003). Deepa's narrative points out some of the problem and suggests the remedies:

However much the girl learns, gets educated, or performs equally with boys in education and work area with equal talents, there is this feeling that she is a girl so she is second. See, she may be earning better or more than him or be more intelligent than him, she is always the second.

This preference for boys has come a long way. In a family this girl child is doing 100% well in everything like curriculum, other activities everything, and that boy is achieving low compared to this 100%. People say that he should perform like the girl and more than her, they don't encourage her anymore. Even if she gets an admission to an engineering course, parents say that their son must be enrolled in engineering. They don't have plans for their girl.

I am trying to create better gender sensitivity in my son. That he should respect girls. There should be an overall change in education from the beginning. Like for example making her economically independent ... I want to say here it is not just education, totally there should be a change in the attitude. (Deepa, non-working woman)

Indian women are uniquely positioned in an intersection of class, caste, gender, race, ethnicity and nationality (Jeffery & Basu, 1998; Mankekar, 1999; Mohanty, 1991, 2003). Middle-class women are often expected to be the preservers of their tradition and culture (Tharu & Lalita, 1993). Although cultural influences are still strong, democratisation, modernisation, women's participation and educational inclusiveness affect women's lives

in many ways (Cranney, 2001; Ganguly-Scrase, 2002; Hancock, 1999; Taber, 2007). Thus education and citizenship in a postcolonial environment poses many challenges. In India, where a decentralised local governance system (the local village *panchayat*) is in operation, there has been only a limited change in women's involvement and expression of agency (Vijayalakshmi & Chandrashekar, 2001). A study conducted by Sooryamoorthy & Renjini (2000) found that at the village level women are enthusiastic about holding the reins of power in local, decentralised, administrative organisations. However, men tend to intervene and act as decision-makers. Vijayalakshmi and Chandrashekar (2002) observe that although women representatives in local governance possess authority, it has not resulted in a shift in power. They emphasise that "an alternative conception of power which is centred not on the position but on the individual" is required (Vijayalakshmi & Chandrashekar, 2002, p. 1). Kanaka's narrative aptly illuminates how tradition suppresses the intentions of formal education for a girl:

She can achieve something only if her husband, children, family members share her dreams ... if they don't cooperate she is at a loss. Even if there is a slight lapse somewhere, then it is her lapse, she cannot achieve.

In our society a girl has boundaries from her birth. She is under her father's control as a girl, she belongs to her husband on being married and later she is a subordinate to her son. We women construct our lives within four walls.

Issues of power and control are strongly visible even in an educated woman's life irrespective of her being employed. Modern formal education and a career do not result in equity and control. Kanaka makes this clear:

One of my classes has about 15 girls and 25 boys and there is this boy. His parents come to me and say, 'look madam, my daughter is ok. She is in that class. All we have to do is pay some dowry and get her married off. But my boy here, in his case we are particularly attentive. He has to be educated highly and sent off to America. So pay more attention to my boy.' But the reality I know as a teacher is that boy is lacking capacity to perform well, but the girl is very sharp, intelligent. She is performing well. But our management forces us teachers, to pass these boys compulsorily to higher classes even though they lack the ability. See, with management pressurising us, even though we have all the awareness, we cannot say anything. We cannot practise our awareness.

Empowering women with literacy that makes them better negotiators in the male-dominated world is very important and needful (Ramachandran, 2000). However, has education enabled women to negotiate equity and achieve agency? Educated women's image of their private life reflects that of their public life. The "housekeepers of the emotions" (Benhabib, 1987) may not be positioned as "critical knowledge-keepers" in a traditional society. Is education in these conditions transforming the learner's life circumstances through critical conscientisation? Or is the reality of the social expectations of women's subordination a greater influence? Are the two diametrically opposed? Or can women find a third space?

Conclusion: An Insider's Tensions and Contradictions

Educated women in postcolonial countries seem to live on the border between the world of formal educational goals, achievements and professional identities, and an 'under the surface' confusion as to 'why did I get so much education?' or 'what is the purpose of being an educated woman in this traditional society?' Without having any support from a male family member, Vinathe had to leave her family and their traditional lifestyle after her bachelor's degree and struggle to make use of her education and find an alternative life quality. In the course of those changes she underwent a series of personal conflicts and experiences of being torn apart with shifts in her cultural locations and a clash between tradition and modernity. Hers was a struggle that strengthened individual agency in choosing alternatives.

Girls' and women's education has been a contentious topic within the local cultures of many postcolonial countries. Sen (1999) observes that only through greater achievement in female education can a country progress. Questions arise around this progress: Progress in terms of what? Is progress economic or social? These questions reflect the everyday tensions and conflicts of 'being an educated woman'. Being educated also means being informed, being a more participative citizen and being more empowered to take decisions in everyday life. However, in the present times an educated and informed person is pushed towards becoming suitable for a job and career market. A woman getting work "outside the home" and "standing on her own" does not guarantee that she expresses herself as a "free human mind" (Sen, 2005; Tagore, c1961) celebrating her individual agency and identity. In everyday life, in most postcolonial societies, people tend to place a significant amount of importance on formal education, but separate education from everyday culture. The in-between location created from being educated is a postcolonial space of many conflicts, constant tensions and contradictions. It will remain so amidst the effects of globalisation.

Acknowledgements I wish to acknowledge and thank Dr. Christine Fox for her involvement in brainstorming the ideas for this chapter and Dr. Eric Brymer for his continued support and encouragement.

DEMOCRATIC INEQUALITIES: THE DILEMMA OF ELEMENTARY EDUCATION IN INDIA

Vimala Ramachandran¹

Citizenship, Participation and Education

When asked to write a paper on democracy and education in India, I started off by speculating about the link between the two. India has witnessed over 20 national general elections and innumerable state and local government elections. Women and men come out in large numbers to cast their vote. Every few years the largely semi-literate and illiterate electorate votes governments out of power and makes its voice heard. This is no mean achievement. If this is indeed the case, what is the relationship between education and democracy? Philosopher John Dewey posits a positive correlation between the two and argues that education is a central requirement for a democratic and inclusive polity. But India's experience with electoral politics could lead one to argue that the classic doctrine does not apply to India. Is this really so? How does education or the lack of it and inherent inequality in quality and access impact on democratic practice? I begin with a personal journey and move on to explore the twists and turns in the discourse of education, equity and democracy.

I started working with women convinced that women as individuals have little voice in our democracy and that coming together as a group, a collective, would enable them to negotiate the world around them from a position of strength – whether they are literate or illiterate, educated or uneducated. So I worked with like-minded people in a government programme (Mahila Samakhya: Education for Women's Equality) that facilitated the formation of women's groups, engaged them in processes that helped them reflect on their life experience, share personal struggles and discern patterns of oppression. This, I believed would create opportunities to transcend their personal life situation and look at oppression, discrimination and violence as a social phenomenon as a product of social and gender relations in society, caste and class dynamics that frame the lives of people. I was convinced this would initiate a process of real education – develop ability for critical thinking, the confidence to articulate problems and issues and make more informed choices.

Yet, as we went ahead with our agenda of empowerment, we came to a roadblock. The very fact that most women we worked with were either illiterate or barely literate inhibited their ability to take control of the institutions that they had created, affecting their ability to participate as equals. Leadership of groups and federation of women's groups invariably passed on to people who were educated – those who could deal with

the written word, read and write and comprehend the complex matrix of social and political institutions – whether it was the self-help groups working towards sustainable livelihoods or social groups striving for participation in local self-government institutions or development groups trying to access resources for their community. The very fact that poor women did not attend school or went to schools that taught them little emerged as a barrier to participation in institutional processes. This phenomenon was palpable where women fought and won Panchayat elections – illiteracy or being semi-literate was clearly a barrier to effective functioning. Even more disturbing was that their children and grandchildren were also being denied access to meaningful education. The inter-generational cycle of poor education/illiteracy and poverty kept them at the bottom of the layer. Their caste, location, community and economic situation determined whether they participated.

What Has All This to Do with Democracy?

We all know that Indian voters vote in large numbers and throw out governments that do not meet their expectations. We also know that literacy and education has little to do with people's ability to exercise their right to vote (except in places where they are prevented from casting it). Also that given the nature of the political system, they have few choices. Yet, they exercise their choice, however limited.

At a formal level democracy is about exercising choices. It is about franchise and it is about one-person one-vote and one-vote one-value. At a little deeper level we also associate democracy with rule of law and institutions. We expect democratic societies to respect civil liberties and human rights, place great value in an impartial judicial process – a mechanism through which people can aspire for justice. We take great pride in a legislature that makes laws and an executive and administrative system that follows these laws. We give importance to the right to free speech and a media that functions within a competitive environment. Most importantly, we value our right to equality and want to be treated as equals. We recognise that existence of democratic institutions is a prerequisite for a vibrant democracy.

Subsequent stages get a little more complex. The mere existence of democratic institutions does not ensure democratic practice. The Constituent Assembly understood that rights could be realised only if we created a level playing field. Acknowledging the centuries of discrimination based on caste we initiated policies of affirmative action and to counter the historical baggage of social exclusion and economic exploitation, introduced reservations in educational institutions and in government jobs. There was consensus that – at least at the formal level – affirmative action was in keeping with the spirit of democracy and equal opportunity. In this, education was positioned as a central tool for the realisation of the constitutional obligation of equal opportunity. The debates in constitutional assembly dealt with this issue at some length and there was a national consensus on using affirmative action as an effective mechanism to counter centuries of discrimination and exclusion.

An early twist in our tale of democracy and equality came in the failure to make Universal Elementary Education (UEE) a fundamental right of children, instead of relegating it to the Directive Principles – non-justiciable guidelines rather than a judicially enforceable right. Making universal elementary education a fundamental right would have had far-reaching

implications. Firstly (from the point of view of the government at that time), it would have involved enormous investment in schooling infrastructure. Secondly, making it a justiciable right would mean that citizens could take the government to court if access to school was not made available.² As a result, even as UEE was accepted as the minimal non-negotiable requirement for ensuring a substantive practice of democracy, the founding fathers of democratic India did not make it a fundamental right. As a result, five and a half decades after we declared ourselves a sovereign democratic republic, we have still to redeem the pledge made in 1950.

Education may have no direct one-to-one relationship with the formal democracy; however, experience over the last six decades has shown that lack of education has affected the ability of citizens to engage with the institutions associated with the practice of democracy. It affects the ability of people to transcend the situation in which they find themselves at birth, impairs their ability to negotiate the maze of institutions that surround them, robs them of self-esteem and confidence, and silences the voice of the marginalised and the dispossessed. Ultimately, its absence pushes “people without voice” into ghettos – resurrects caste, community, religious and linguistic identities, and creates new forms of social exclusion and social segregation. Education, despite the power to work as an agent of change, to “neutralize the accumulated distortions of the past” (Chapter IV, Page 6, Paragraph 4.2 and 4.3; NPE-1986, Government of India) could not play this role. India today has different kinds of schools catering to different groups of the population. Schools come in different shapes and sizes – vernacular medium vs. English medium; government schools vs. private schools; formal schools vs. transitional schools; single teacher schools vs. schools where each class has one teacher; and so on. Unfortunately this has reinforced existing social and community identities. India’s educational trajectory in many ways seems to confirm Professor Partha Chatterjee’s apprehension about the nature of postcolonial societies – wherein the colonial system of inequality is perpetuated.³

A personal journey that started with women’s mobilisation and empowerment has over time taken me into the arena of primary education – the battleground where the politics of inclusion and exclusion is played out from one generation to the next, reducing those at the margins as silent spectators of the grand theatre of periodic elections that bring about little change in the basic structure of oppression and exclusion.

The relationship between education and democracy is like an invisible spiral that helps those in control remain there and those at the bottom alienated and voiceless. As it has manifested itself in Independent India, education impacts through its potential of enhancing the capability of people, the substantive practice of democracy more than the formal system of elections. Education has the potential of enhancing the capability of people. As Dreze and Sen (2002) convincingly argue: “‘Capability’ refers to the alternative combinations of functioning from which a person can choose. Thus the notion of capability is essentially one of freedom – a range of options a person has in deciding what kind of life to lead. Poverty, in this view, lies not merely in the impoverished state in which the person actually lives, but also in the lack of real opportunities – given by social constraints as well as personal circumstances – to choose other types of living” (Dreze & Sen, 2002, pp. 35–36). Lack of access to education of acceptable

quality actively inhibits the development of the capability of citizens to engage with democratic institutions, thereby denuding the practice of democracy.

This paper explores how our education system has created new hierarchies and forms of social exclusion and inclusion – thereby challenging the very foundations of equality and equal opportunity and leaving an indelible mark on the practice of democracy. As noted in the prophetic words of Dr. B. R. Ambedkar:

On the 26th of January 1950, we are going to enter a life of contradictions. In politics we will have equality and in social and economic life we will have inequality. In politics we will be recognising the principle of one man one vote and one vote one value. In our social and economic life, we shall, by reason of our social and economic structure, continue to deny the principle of one man one value. How long shall we continue to deny equality in our social and economic life? If we continue to deny it for long, we will do so only by putting our political democracy in peril.

(Dr. B. R. Ambedkar, 1949, quoted in Khilnani, 1997, p. 35)

The Cumulative Burden of Exclusion

In 2003 I was engaged in an interesting multi-sectoral qualitative research project. The object: to explore factors that facilitate or impede successful primary school completion among the lowest economic quartile of the population in Karnataka, Uttar Pradesh and Andhra Pradesh. This study explored different domains – the child, family, community and institutions (specifically the primary school, Integrated Child Development Services (ICDS) and other health-related services) that impact on child health, nutrition and education and their interlinkages, both positive and negative (Ramachandran, 2004). We spent considerable time in villages and urban slums, talking to women, interacting with children, observing schools and early childcare centres and interviewing teachers and care givers.

The story was the same everywhere – poor and weak mothers giving birth to children growing up in an environment of extreme deprivation. Given the veritable absence of institutional support, an inter-generational cycle of poor health, nutrition and education is set in motion. Endemic malnutrition, partial or no immunisation, poor sanitation and hygiene, and frequent bouts of illness sap children of energy and affect intellectual development. When children from the poorest communities reach preschool age, their caste, location and economic situation become the defining variables framing their chances to access services such as supplementary nutrition and preschool education. As they reach school-going age, all that they are assured of is that their name will be recorded in a school register as proof of formal enrolment. Their access to a “formal” or “transitional” school is determined by their economic status, place of residence, their caste, community or religion. However, what is not assured is whether they will be able to attend school uninterrupted – not merely because of ill health but also because very little happens in the schools meant for the very poor. Teacher attitudes towards such children are, at best, indifferent, and compounding the problem is the fact that most

of the children, especially girls, work before and after school. There is no guarantee that they will learn to read and write – especially as they go to overcrowded single-teacher schools or where the teacher/pupil ratio is high (reaching up to 1:120). If they live in a remote habitation or come from an impoverished community, the chances are that a local person with little qualification (popularly known as “contract teacher” or “parateachers”) may teach them.

Nevertheless, parents were still eager to send their children to school and the children themselves were full of hope. Their aspirations, however, were tempered by opportunities as they exist or as they do not. The initial enthusiasm to participate gradually turns to resignation and apathy – children become irregular, hang around at home or on the streets and often start pitching into the work of their families – in most cases dropping out without learning anything. A few who can afford it may shift their children to a private school or send them to a tuition class. The inter-generational cycle is perpetuated, with the new generation being (at best) semi-literate, weak and apathetic or in many instances angry at a system that has treated them with such indifference. Some of our more disturbing findings related to the abysmal state of government programmes designed to provide a social safety net for the poorest of the poor.

The cycle of deprivation starts with early marriage. The mean age of marriage is 13 (Uttar Pradesh) and 15 (Karnataka and Andhra Pradesh).⁴ Most young women are anaemic and weak. Most babies from 6 months onwards to about 36 months receive little supplementary nutrition – and an overwhelming proportion of children show signs of severe or moderate malnourishment. They are constantly on the breast, cry a lot and are given a few pieces of *roti* (Indian bread) or some rice to nibble on. Frequent illness, even if only cold and cough, affects the ability of the child to access food on his or her own, feed and absorb the food. Rarely is cooking oil or fat used in most of these households, even for children. A shocking finding in Uttar Pradesh was that most of the children from the poorest households had received only partial immunisation – meaning polio drops. The situation in Karnataka and Andhra Pradesh was somewhat better. While nearly all children had received polio drops and approximately 40%, BCG shots, other vaccine-preventable diseases (DPT, Measles) did not seem to be on the priority list of service providers.

Though the flagship ICDS programme is designed to prevent child malnutrition among the poor families, discussions with Aanganwadi workers revealed that there was no system for identifying the severely malnourished for providing double rations. Access was determined by the worker’s caste and location of the centre. As a result most of the families surveyed in Uttar Pradesh and Andhra Pradesh did not avail of supplementary nutrition provided by the government. In fact, in Uttar Pradesh the fortified nutrition supplement was supplied to ICDS centres for only about 5 months a year, much of it siphoned off for sale in local shops.

Given such odds, children who do survive and reach the age of 6 are weak, malnourished and listless. Boys and girls, even those as young as 6 years, are engaged in a wide range of chores – grazing, collection of fodder and fuel, domestic work, sibling care and filling water. It may not be possible to make a tangible link between endemic poverty, malnutrition and educational attainment/achievements, but the very fact that children do not receive adequate nutrition and have little access to health care is worrisome.

Health, nutrition and education have a decisive impact on a child's development. The health and nutrition status of both mother and child is clearly more significant in the early years since it affects later cognitive development. Persistent and cumulative neglect ensures a non-attainment of appropriate developmental milestones. Health and nutritional outcomes at each stage are carried on to the next, an inter-generational transfer of handicaps resulting in a downward spiral of poverty, ill health, malnutrition and poor learning outcomes for children.

The point is not about the persistence of abject poverty, but that government schemes meant for the poor rarely reach those who need it the most. Children starting life with a handicap does not auger well for a democracy. It is the cumulative character of social, political and economic exclusion that frames the lives of poor children, influencing their ability to participate in schooling and social and political life in later years.

Children experiencing a cumulative burden of failure on all fronts (health, nutrition and education) enter adulthood with little self-esteem or confidence. They are the ones who end up as daily-wage earners, are often forced to migrate in search of work and continue to live in poverty. They are, for all practical purposes, disenfranchised, not from casting their vote, but from most other aspects of social and political life. They are the ones with no voice.

Unequal Access and New Hierarchies

The 1990s are often hailed as the happening decade – at least in terms of primary education. This decade witnessed an unprecedented jump in literacy levels and in enrolment rates especially among the socially disadvantaged social groups. Female literacy went up from 32.17% in 1991 to 45.84% in 2001 – a 13.67% jump in the decade of the 1990s. Gross Enrolment Ratio at the elementary level for Scheduled Tribes (ST) went up from an abysmal 40.7% in 1991 to 75.76% in 2004 and for Scheduled Castes from 52.3% to 71.86%. The flip side of the scenario is that 53.7% of enrolled children (57.7% for girls) drop out before they reach grade 7. This essentially implies that while a very large number of children enrol in schools, a disturbingly high proportion drop out before they can complete the elementary level. An overwhelming majority of children who drop out are poor (rural and urban), come from socially disadvantaged communities and are first-generation school-goers.

Despite 67,000 new primary schools – this decade also saw the institutionalisation of different categories of schools designed for (catering to) different population groups. As mentioned earlier there are different kinds of government schools – the regular government school essentially services the poor in urban and rural areas, education guarantee scheme schools cater to children who cannot access formal schools either because of physical or social distance, the alternative schools are expected to cater to children who cannot access formal school (e.g., night schools of Rajasthan), residential schools for tribal children and the private and private-aided schools to urban and rural middle class. Recent studies (PROBE, 1999; Ramachandran, 2002, 2004) reveal that schools in different localities in the same village are endowed differently with respect to infrastructure, teacher/pupil ratio and trained teachers. There is also a

significant difference in the quality of schools that come directly under the education department and those managed by the social or tribal welfare departments.

Another important dimension of inequality has to do with teachers. It is common knowledge that remote and inaccessible schools are dysfunctional because of non-availability or rampant absenteeism of teachers. Teachers are a highly organised group and wield considerable political clout – after all they are the returning officers during elections. Appointment, transfer and posting of teachers are highly politicised. So what has the government done to address this problem?

Rajasthan pioneered a new strategy in 1987. The Rajasthan Shiksha Karmi Project (SKP) was designed to address teacher non-availability in remote rural areas. The project provided for local recruitment of a teacher – known as shiksha karmi (education worker) – albeit with lower formal educational qualifications. The accent was on local recruitment in consultation with the village community. She/he was given intensive training for 2 months. This new “teacher” – subsequently renamed “parateacher” – was paid a fraction of the salary of formal government teachers. Though designed to meet specific requirements of dysfunctional schools in remote areas, the model itself caught the imagination of administrators. Here was a low-cost and effective model that could solve two problems in one stroke – reduce the cost of providing additional teachers in an expanding education system (reducing recurring financial liability) and ensure availability of teachers in hitherto dysfunctional schools. This scheme provided an opportunity for career advancement for teachers by enabling shiksha karmis to be regularised as formal teachers if they fulfilled some academic standards.

Madhya Pradesh is credited with the next big innovation – the Education Guarantee Scheme (EGS). Panchayats could petition the government demanding a school in a village or habitation provided there were 25 children who did not have access to a primary school within 1 km. The government in turn guaranteed a school within 90 days of receipt of the petition. The panchayat was expected to provide the space for an EGS school and identify a local person who could be appointed “Guruji” – after an interview and intensive training by the education department of the state government.

While it is important to acknowledge that SKP and EGS did enhance access and that remote rural areas finally saw a functioning school – the level of investment in infrastructure, teacher development and teaching learning material varied greatly. In keeping with the spirit of affirmative action enshrined in the Constitution the government should in fact invest far more resources in the education of the most disadvantaged communities. What happened was to the contrary – the per capita investment on education went down in remote rural and tribal areas and even new slum settlements in urban areas. Low-cost models were scaled up and adopted where greater investments were necessary.

A new kind of segregation is clearly discernible at different levels. Children from clearly different social and economic groups attend different types of school. Even within government primary schools, there is evidence of sharp differences in quality – physical facilities, community participation, allocation of funds – as illustrated in the micro-studies as well as other reports and research papers. (Ramachandran & Sethi, 2001; Mazumdar, 2001; Nambissan, 2001). Poorer areas have a higher proportion of single-teacher schools and multi-grade classrooms. Even where different models were

not in operation till recently the rural and remote schools got a larger number of poorly trained contract teachers. As a result, children from disadvantaged groups and from very poor families who have no other options (private schools, tuitions) make do with whatever schooling they get.

This reinforces existing stratification – giving rise to new hierarchies of access. Paradoxically, those who need the support of the state (the most deprived) are the ones who get the least. While the number of schools has definitely gone up, the more remote and difficult areas have a high proportion of single-teacher schools, single-classroom schools and they also have many more parateachers and contract teachers. The democratisation of access to schools is accompanied by a reaffirmation of a child's caste, community and gender in defining which school she or he attends.

Does this augur well for a democracy? At one level we are concerned about an increasingly polarised society where caste, religion and language identities are reinforced in politics. Political parties mobilise along caste and community lines – pitting one group against the other in order to capture votes. At another level, government schools no longer provide a common meeting ground for children of different communities; children today grow up without getting an opportunity to mix with children from other social groups. While this may not be the case in fee-paying private schools – children from middle-class and affluent families have greater access to world media and are thus exposed to different viewpoints – the majority of poor children not only go to schools where they mix with their own kind but also have little access to the media (print and visual). They are the ones who are doubly disadvantaged – poverty and poor quality education.

Inside the School, Evidence of Discrimination

Savitri's family is anything but well off. But when she dropped out of school here in Viraatnagar, it wasn't because of poverty. Her own classmates and teacher made it impossible for the 15-year-old to continue. "The moment I enter the room in school, the other children make faces. They start singing 'bhangi aayee hai, aayee hai, bhangi aayee hai!' (the bhangi has come). The words of the song are foul and insulting." Savitri is from a family of manual scavengers. A group that's among the most vulnerable within Dalits. The official label for them is 'bhangi'. Many here are from the Mehter caste. And quite a few of these groups now call themselves Balmikis. With even other scheduled castes practising untouchability towards them, they end up pretty close to the bottom of the social heap. Women scavengers cleaning dry latrines tend to draw their pallu over the noses and grip it in their teeth. That offers them some protection in their unsanitary work. The children at the school mimic this when Savitri enters. "They bite a side of their collar, push their noses up. Sometimes put a hanky on their faces. I would start crying, but it didn't matter to them".

(Sainath, 1999)

The year was 1999. Well before the bone-chilling Godhara incident and the communal riots that followed in Gujarat I was travelling in Gujarat with members of a Dalit organisation documenting their experience. We interacted with the most disadvantaged

among the Dalits – the Valmiki community engaged as sweepers, to dispose dead animals, clean open toilets and carry the night soil on their heads. During field visits we encountered many situations where the laws of the land were violated. The land adjacent to Dalit localities in many villages was used for dumping cow dung and other garbage. The environment was unhygienic. We encountered social boycott, violence and intimidation. We spoke to people who were forced to work as bonded labour due to indebtedness. We visited areas where the land allocated to Dalits was controlled and cultivated by Patels and Durbars.

The most subtle, yet most devastating blow to the self-esteem of Dalits was visible in primary schools. We met a large number of children who were formally enrolled in the government school but did not attend. When asked why, they talked about the behaviour of the teachers, the physical distance maintained by other children and how they had to sit separately in one corner of the classroom. Girls talked about how their fellow students covered their noses with cloth when they were in close proximity. Children who braved all odds to continue in school talked about how they were invariably asked to sweep the floor or clean up but never asked to fetch water. The relatively better-off Dalits manage to escape to nearby urban areas or to private fee-paying schools where they may be assured of some degree of anonymity. The poor who depend on government schools just stop attending, even if they are formally enrolled. A young man in his early twenties asked what was the use of affirmative action by way of job reservations when majority of Dalit children are denied basic education and when an overwhelming proportion of the poor are those who are at the bottom of the caste hierarchy. Another young man asked what the meaning of democracy was: does it only mean voting every 5 years? He asked us whether democracy could genuinely thrive in an unequal society and one that is “racist”. And most troubling of all, he asked if people like him are citizens of the country (Ramachandran & Prasad, 2000).

This situation is not confined to Gujarat alone but is, unfortunately, an all-India phenomenon. The socio-economic profile is a barrier to participation in education. It is well known that Dalit families live in settlements that are distant from the main village. A school or for that matter an ICDS centre is not readily accessible – physical and social distance acts as a deterrent, especially in a situation of heightened social tension. This is more than obvious when we examine macro data on enrolment, retention and completion. Over 50% of Dalit children who enter primary school leave by class 5, with a majority dropping out before they reach class 3 (Nambissan, 2001). The situation in tribal areas is much worse given a large number of single-teacher schools, rampant teacher absenteeism and, worse still, teachers who are posted are unfamiliar with the language spoken by tribal children. The data are quite disturbing – 48.7% of tribal girls and 49% of tribal boys drop out before completing the primary cycle.

Even more tragic – those who brave it and continue learn very little. In the years 2005 and 2006 an independent non-governmental organization (Pratham) facilitated a nationwide sample survey on learning outcomes of children. The results were shocking. In 2005 close to 35% of children in the 7–14 age group could not read a simple paragraph (grade 1 level) and almost 60% of children could not read a simple story (grade 2 level), 65.5% of children in the 7–14 age group could not tackle simple arithmetic problems and more worrying was that 47% of children in the 11–14 age group could

not solve grade 2 level arithmetic problems. In 2006 the survey found that the situation was not very different. Almost half of standard 5 children could not read a standard 2 text. Suman Bhattacharjea points out: “[T]his early inability to ensure that children gain grade-appropriate reading skills obviously intensifies the subsequent burden on both children and teachers ... ASER 2006 data confirms that this is losing battle: in standard VI, after having completed the recommended minimum of 5 years of education fully, one third of all students cannot read at the level established for Standard II.” It is therefore not surprising that over half the children who enter grade 1 drop out before they reach grade 8, with children from the most deprived communities and from rural and remote areas constituting an overwhelming majority of dropouts. Education has meant little to these children – they acquire few skills and little confidence.

The dominant perceptions about mental abilities of Dalit or tribal children coupled with stereotypes about certain communities lead to subtle and sometimes even blatant discrimination against some children, leading to higher dropout rate and incidence of failure.⁵ At one level we recognise that Dalit or tribal or Muslim children studying in “mixed schools” face discrimination, affecting their self-esteem and confidence and more importantly their ability to learn. At another level, we are uncomfortable with the idea of segregated schools not the least because schools meant for tribal or Dalit children are invariably mismanaged.

The answer may lie in ensuring neighbourhood schools which are closely monitored – in particular, to prevent blatant caste, community or gender discrimination. The unfortunate reality is that the majority of our school teachers and educational administrators are upper caste, urban and non-tribal. They do not identify or empathise with their students; most, in fact, send their own children to fee-paying private or private-aided schools. Pre-service and in-service training does not deal with the impact of social prejudices and attitudes of teachers on the self-esteem of children and their ability to learn. Teacher educators are themselves blind to the existential reality of very poor children and are often hostile to issues of gender and social equity. Given this situation Dalit and tribal leaders argue that their children are better off in separate schools – provided the government ensures equal investment and equal quality.

Not all teachers are insensitive and prejudiced. As a researcher who has travelled across the country visiting schools and interacting with teachers, one must admit that there are wide regional variations. At one end of the spectrum are states where the majority of teachers are from politically powerful castes – upper caste and OBC. It is not uncommon to come across administrators and teachers who are hostile to issues of gender and social equity – in particular, to most disadvantaged among Dalit (erstwhile untouchable groups, scavengers), tribal and Muslim communities. Caste- and community-based discrimination is not uncommon – even in urban areas.

The situation in tribal-dominated areas and in predominantly tribal states is different. While such prejudices are not immediately palpable (especially among non-tribal teachers or those from dominant tribal groups) the teachers admit that they lack the skills to manage a multi-grade classroom with children from very diverse backgrounds. Sustained enrolment drives and the introduction of midday meals have brought a large number of children into schools – most of whom are first-generation school-goers speaking several languages/dialects. Absenteeism is endemic and teachers take turns

to come to school. As a result a teacher can end up managing over 75–100 children. Teachers admit that they are perennially lobbying to be transferred to more accessible schools – investing a lot of time and money. The basic problems remain of low motivation, absenteeism and indifferent teacher management.

Rural and urban schools in several educationally forward states tell a similar story. Increased enrolment has changed the texture of the classroom: children from diverse social and educational background come to school. The problem is compounded when they speak different languages or dialects. Teachers complain that they have not been trained to manage so much diversity – that too in a multi-grade situation (where one teacher holding two or three classes simultaneously in the same classroom). And as above, they do not understand the family circumstances of their students. They are at a loss to cope with long absenteeism of children during peak agricultural season or when their families migrate for short periods. We face an overburdened teacher with neither requisite skills nor a reliable academic support structure.

There are no simple or straightforward answers – each state and even each district merits context-specific strategies. The larger point is that while schools could counter social prejudices and become agents of change, they end up doing just the opposite.

In India, democracy was constructed against the grain, both of a society founded upon inequality of the caste order, and of an imperial and authoritarian state. If the initial conditions were unlikely, democracy has had to exist in circumstances that conventional political theories identify as being equally unpropitious: amidst a poor, illiterate and staggeringly diverse citizenry. Not only has it survived, it has succeeded in energizing Indian society in unprecedented ways. Introduced initially by a menacingly legalistic nationalist elite as a form of government, democracy has been extended and deepened to become a principle of society, transforming the possibilities available to Indian. They have embraced it, learning about it not from textbooks but by extemporary practice. Yet the very success of India's democracy also threatens its continued institutional survival. The idea of political equality has engendered the menace of a tyranny of the religious majority, a threat traumatically manifested in 1992 by the destruction of the Babri Masjid at Ayodhya. (Khilnani, 1997, pp. 9–10)

We discussed three scenarios in the previous sections – first, of children from poor families and disadvantaged social groups who start life with a cumulative burden of exclusion; second, when school entry and quality of education they receive is framed by their social, economic and geographic status; and third, the post-enrolment experience of discrimination and limited learning – both by way of reading and writing skills and content. Schools often reinforce social segregation – thereby extending the burden of exclusion right through schooling till they are adults. This does not stop here. There are few educational opportunities for young adults who may have dropped out of school – they cannot access skill or vocational training (minimum qualification for enrolment being class 10) further constraining choice.

“Human development is the process of widening choices for people to do and be what they value in life” (HDR, 2004). What impact does systematic exclusion from

health, nutrition and education services have on people who live on the margins? Can they overcome the odds and participate as equals in democratic processes? It is well known that it is the very poor who feel most alienated from institutions – be it the local hospital expected to provide basic health care or the panchayat where they can access developmental schemes meant for them (drought relief, food-for-work), child development centres that provide supplementary nutrition and immunisation, schools – the list is fairly long.

Affirmative action in the form of job reservation could make a difference – provided they are able to complete 10 years of schooling with satisfactory skills and cognitive abilities. This is how the cookie crumbles – almost every socially disadvantaged social group has a small number of families that have broken out of the cycle of poverty and exclusion. This group is often referred to as the creamy layer. It is this small, yet vocal and organised group that benefits from affirmative action, leaving the majority out of the loop. Better management of affirmative action by linking social status with economic situation has met with resistance. More and more social groups (including religious minorities) – even those that are not socially disadvantaged – are today demanding reservations in jobs and in institutions of higher education. As a result the constitutional instruments for correcting centuries of social exclusion have become a source of patronage. They have thrown up a manipulative leadership that uses the rhetoric of affirmative action to perpetuate social, economic and educational exclusion.

The more baffling paradox is why leaders of social movements of Dalits, tribal communities, Muslim minorities and most ironically the women's movement have not raised their voice against iniquitous strategies and poor quality education. Dysfunctional rural schools rarely attract the attention of leaders today.

The Government of India made free and compulsory education a fundamental right of all children in the 6–14 age group through the 86th Constitutional Amendment Act of 2002. The new Article 21A reads as follows: “Right to Education – The State shall provide free and compulsory education to all children of the age of six to fourteen years in such manner as the State may, *by law*, determine.” A corresponding “Free and Compulsory Education Bill, 2004” was drafted by the Ministry of Human Resources Development – but it was not tabled in parliament. Instead the central government circulated the draft to all the states asking them to introduce appropriate bills/ordinances for effective implementation of the 86th Constitutional amendment.

While the draft circulated provides safeguards to ensure that formal schools cater to all children and that the transitional arrangements are strictly short-term – the situation on the ground tells a different story. Given the financial situation of most state governments, transitional strategies are becoming the preferred option. Many state governments have also opted for contract teachers to meet the demands of an expanding elementary education system.

While schools managed and controlled by local self-government institutions (panchayats) is a step in the right direction, the question remains why the formal school system – especially teacher cadre management (transfers and posting of teachers) – continues to remain outside the purview of panchayats. The answer does not lie in institutionalising a poor quality and low-cost model for the most disadvantaged – when

they actually merit greater investment of funds, human resources, teaching-learning material and lower teacher/pupil ratios to ensure greater care.

Here is the final twist to the tale! Can all children who enter primary schools actually go up to class 8 or class 10. The most recent data released by Government of India tell a startling story. According to Government of India (2007) there are 7,12,239 recognised primary schools, 2,62,286 upper primary schools, 1,45,962 secondary schools. This implies that out of every 100 children who enter primary schools, only two thirds of them can move on to upper primary and only 20% to secondary school. The education system is so designed that all children cannot access elementary education, leave alone secondary education. The ratio of primary to upper primary schools and sections is 2.57 for India – the worst ratio is in West Bengal (5.28) followed by Jharkhand (3.97), Meghalaya (3.73) and Bihar 3.24). (NUEPA and MRHD, GOI, 2007)

Who are the children who make it through the system? The answer is obvious – children who attend poor quality primary schools and alternative schools are the ones who drop out of the system. An attrition policy – both in terms of numbers as well as in terms of quality is built into the very structure. Only an exceptionally gifted child from a rural remote primary school can hope to make it to secondary school. Inequality is inherent in the system – right from the time a child is born till she/he becomes an adult.

What implication does this have for a democratic society in India? Do growing differences threaten the democratic fabric of our society? Evidence from different parts of the country is extremely disturbing. While the top 20–25% of the population (that too in the industrialised regions of the country) is gung-ho about globalisation and the India growth story – the bottom 25% is struggling to eke out an existence. The social, cultural, regional (location specific), community and the occupation profile of those at the bottom of the pyramid is yet another marker – pushing them from the margins to the wild. Increasing social strife coupled with electoral politics that reaffirms social identities is a cause for concern. Yes, there is a global demand for skilled work force – yet only a small fraction of our children can even dream of accessing education that will enable them to take advantage of the growing demand for skilled people. There is an urgent need to go back to the drawing board and re-image education afresh.

India in the South Asian Region

Most discourses on India invariably start with an invocation of the democratic tradition. After all, India just celebrated 60 years of Independence as a vibrant democracy. Notwithstanding this one fact, India is not very different from the rest of the countries in this region. Poverty, uneven development and historical colonial legacy are not unique to this region. But it is widely acknowledged that South Asia is culturally different, particularly with respect to gender relations. This region has a high population density and per capita income is only higher than sub-Saharan Africa.

Another significant characteristic of this region is that it has an estimated 400 million young people aged 12–24 – accounting for close to 30% of all young people in the developing world. This “demographic dividend” is said to have accounted for a third of East Asia’s economic miracle. “The recent success stories of East and Southeast Asia and Ireland suggest that development requires a combination of factors... Interactions

among the many relevant factors have the potential to set off virtuous development spirals and to halt vicious spirals” (Bloom, 2005). The potential of this dividend is even greater in South Asia. The World Development Report (WDR) of 2007 predicts that this cohort will grow slowly (except in Pakistan) and will peak in the next 25 years. Close to more than 45% of these young people are girls and women. Women’s participation in decision-making is limited not only because of the unique cultural characteristics of this region but also because of high dropout rates after primary school among girls.

In the last few decades rapid economic growth in South Asia has infused a sense of optimism – it could be compared with the economic boom witnessed in East Asia in the 1990s. East Asia has been relatively more stable for several decades now and has experienced rapid economic development as well as good progress in human development indicators. This region has also been seen as being relatively more forward-looking – especially with respect to gender relations, women’s participation in workforce and girls’ participation in education. South Asia, on the other hand, has experienced social and political conflict, natural disasters and internal strife. What places South Asia apart from East Asia is the *persistence of gender inequality*. Yet, *the potential* of exponential economic growth and the promise of accelerated educational development have instilled a sense of optimism and hope. However, as compared to Southeast Asia, this sub-region has a long way to go before attaining higher human development goals as well as greater gender equality.

Clearly, the region faces formidable challenges. But it also holds out the promise of rapid progress and development. Nobel Laureate Amartya Sen has pointed out time and again that gender inequality is keeping the region back. He believes that if the countries are able to prioritise education, health, nutrition and overall well-being of girls, the region may see unprecedented change. The big question is whether – given the sociocultural milieu – can the region rise above narrow communal and domestic walls and think big?

Notes

1. This paper was originally prepared under the aegis of the project “State of democracy in South Asia” of Lok Niti Institute for Comparative Democracy, Centre for Studies in Developing Societies, New Delhi in 2005. I would like to thank Peter de Souza and Yogendra Yadav of Lok Niti for giving me a chance to think through this issue and write about it.
2. It is indeed very interesting that these issues continue to dog us in 2007! The bill detailing the implications of making education a fundamental right is yet to be enacted.
3. See Partha Chatterji books – *The Nation and Its Fragments: Colonial and Postcolonial Histories*. New Jersey: Princeton UP, 1993 and *Nationalist Thought in the Colonial World: A Derivative Discourse?* 1986. Minneapolis, MN: University of Minnesota Press, 1998.
4. The mean age of marriage for the population as a whole is 19 (Uttar Pradesh), 20 (Karnataka) and 18 (Andhra Pradesh) – NFHS, 1998.
5. P. Sainath has documented the situation of Dalits across the country from 1999 onwards. Articles appearing in *The Hindu* reveal persistent social discrimination inside the school. Certain specific groups among the Dalits, like Valmiki, Rohit, Thoti, Chamar and in tribal areas the non-dominant tribes and denotified tribes (classified as criminal tribes by the British) are not only discriminated against by the forward castes, but by other Dalits, who consider them untouchable.

CURRICULUM REFORM IN SUB-SAHARAN AFRICA: WHEN LOCAL MEETS GLOBAL

Linda Chisholm and Ramon Leyendecker

Introduction

Educational change in sub-Saharan Africa since the 1990s is a diverse and complex issue. Not only are the societies, their socio-economic and political profiles extremely varied, but heterogeneous external and internal forces have also influenced their trajectories of educational change. If anything can be said to bind such diverse contexts, it must include the history and impact of colonial and postcolonial endeavours. On the one hand, the legacies of colonialism continue to hold great power over the imaginary and real lives of states and citizens. On the other hand, the political transitions that swept over many parts of sub-Saharan Africa from the 1960s were accompanied over the successive decades by growing political instability, debt and poverty. The region's real GDP per head fell by 42.5% between 1980 and 1990; its income distribution has become more unequal. Although the growth rate has improved since the mid-1990s, "sub-Saharan Africa has found itself retreating economically while other developing areas of the world are advancing strongly" (Sparks, 2006). The causes are both external and internal and economic and political (see Williams, 2006; Jennings, 2006; Sparks, 2006). New education systems and especially higher education institutions were established in the immediate postcolonial period as key projects of national pride, aspiration and affirmation. These also experienced increasingly serious difficulties as political crisis combined with economic crisis.

In the early 1990s, the seemingly distant event of the fall of the Berlin Wall and gathering pace of globalisation also had distinct implications for Africa. Not immune from world currents, many countries in Africa held multiparty elections in the early to mid-1990s to signal commitment to liberal democracy and market openness consistent with world developments even though authoritarianism remained part of many political systems. These elections legitimated the new market orientation that had begun to take hold in the 1980s and paved the way for educational and curriculum reform, including demands for greater accountability with regard to the spending of development aid on education. They ushered in new processes for educational and curriculum reform. This article examines curricular reform, and specifically learner-centredness, outcomes- and competency-based education and the National Qualifications Framework. The analysis encompasses evidence for sub-Saharan Africa, but provides a specific focus on Southern Africa.

A considerable literature has emerged over the past decade and a half exploring the impact of these new developments through an examination of the relationship between policy and practice. Policy sociology has shown that policy and curriculum implementation does not follow the predictable path of formulation–adoption–implementation–reformulation, but is recontextualised through multiple processes (Ball, 1990, 1994; see also Bernstein, 2004) and mechanisms (Dale, 1999); that most implementation happens with little regard for available capacities or resources (Elmore, 2001); that local, and especially teachers' values, practices and beliefs shape the outcomes of implementation (McLaughlin, 1991, 1998); and that the way to understand implementation is to start with an examination of practice (Sutton & Levinson, 2001). Comparative education has also emphasised the role of globalisation (Carnoy, 2000), processes of discourse formation (Schriewer, 2003) and impact of local contexts in producing asymmetrical patterns (Steiner-Khamsi, 2004).

Not much of this literature takes account of African contexts, or their considerable diversity. Indeed, they are, for the most part, largely invisible. Here two main approaches to the problem of the relationship between policy and practice can be identified. The first emphasises mainly external and the other mainly internal reasons for policy failure, although neither ignores the other. There are also significant differences within each approach. The first focuses on political economy and the overwhelming and decisive role of donors and multilateral agencies in shaping policy goals in the majority of contexts (Samoff, 1999a, b, 2001, 2005; Tabulawa, 2003; Vavrus, 2003).

The second focuses, on the one hand, on the resilience of distinctively African forms of social organisation, and on the other hand, on the nature of policy and the politics of education. Stambach, for example, has shown how schools on Mount Kilimanjaro mediate collective and individual notions of and identifications with modernity while hardly altering dominant, ritualised call-and-response styles of teaching; these show strong resonances with patrilineal values and hierarchies, and age and gender relations that reinforce male authority. And Tabulawa has argued that failure in attempts to introduce learner-centred education in Botswana has much to do with the strength of agreement between traditional and colonial approaches to learning (Stambach, 2000; Tabulawa, 1997). A sophisticated variation on this theme, which examines the complexity of local educational practices in Ghana, has demonstrated how different international, national and local discourses jostle alongside one another in the same school, where teaching can remain lacklustre and rote-learning-centred, but opportunities can nonetheless be created where students do actually learn from one another (Coe, 2005).

Authors in the South African context have likewise focused on contradictory outcomes. Here, however, policy failure has not been linked specifically or mainly to the imposition of policy from the outside, or to specifically 'African', 'traditional' features. Rather, they have focused on internal politics and contradictions. Thus Jansen (2002) has emphasised the symbolic role of policy in political transition to explain non-change, Harley and Wedekind (2004) and Jansen (2005a) have highlighted the contradictions between pedagogical and political ideals and the great diversity in the context of practice, and Hoadley, Reeves and Muller have underscored the socially reproductive role of schools and the centrality of variations in teacher knowledge and

pedagogy in reproducing historical fault lines of inequality (Hoadley, 2007, 2008; Reeves & Muller, 2005).

These approaches are not mutually exclusive, as the work of Tabulawa illustrates. He (Tabulawa, 2003) has argued that the ascendancy of neo-liberalism as a development paradigm in the 1980s and 1990s elevated political democratisation as a prerequisite for economic development and with it, learner-centred pedagogy. For him, the pedagogy is part of “an ideological outlook, a worldview intended to develop a preferred kind of society and people ... representing a process of Westernisation disguised as quality and effective teaching” (2003, p. 7). The argument here does not however explain the favourable reception of the idea at the local level. In attempting to explain why learner-centred education has been both accepted so easily and implemented with such difficulty, this paper argues that both external and internal reasons need to be taken into account.

The chapter focuses less, however, on African culture as a cause of implementation failure, than on the combined non-relationship of international and national-level discourse to local realities and practices. In so doing, it draws on much existing work. But it argues in addition that local histories of resistance to colonialism incorporated educational ideas that reverberated with learner-centred education. Learner-centred and outcomes-based education found local favour because they were not entirely new ideas, and were ambiguous enough to be seen as key vehicles for achieving not so much educational, as economic, social and political goals. Learner-centred and outcomes-based education, when they emerged in the post-1990s period, appeared to be a (democratic educational) rose by another name. But its implementation faltered in contexts where capacities and requirements for its realisation varied enormously not only amongst one another but also from the contexts in which they were originally developed. The chapter argues for a complex understanding of external and internal dynamics that takes account of the diversity and differences between contexts of implementation.

The chapter begins with a discussion of the ambiguities and differences between learner-centred, child-centred and competency-based education. It then examines the international pressures on sub-Saharan Africa for curriculum change and the local Southern African historical context and alternative educational experience that, it argues, predisposed Southern Africa to adoption of such ideas. It shows how these have not been realised in practice. It attempts to explain this on the basis that reforms have focused less on what is feasible in contexts of implementation than on the economic, social and political goals to be achieved and concludes with implications for research. In so doing, the article is concerned with how history and context shape goals and ideals of reform and contexts of implementation. The article focuses mainly on curriculum reform based on learner-centred education, but also outcomes-based education and the National Qualifications Framework. Although conceptually distinct, learner-centred education, outcomes-based education and the National Qualifications Framework all represent an interrelated set of ideas that have diffused via curriculum reform across sub-Saharan Africa in the late twentieth and early twenty-first centuries. The article draws on secondary and primary sources relating to a variety of different sub-Saharan African countries.

Learner-Centred and Outcomes-Based Education

Learner-centred education is one of the most pervasive educational ideas in contemporary sub-Saharan Africa and elsewhere. It is often accompanied by competency-based discourses and official shifts in curriculum and assessment policy designed to lessen the significance of examinations and enhance the importance of continuous assessment as a means of stimulating learner-centred pedagogies. And yet there is overwhelming evidence from very different kinds of sources, that the idea has not taken root in classrooms.

Country profiles developed for sub-Saharan African countries by the Vrije Universiteit, Amsterdam, as part of a larger study on Science, Maths and ICTs in secondary education in sub-Saharan Africa (SMICT, 2005) indicate the prevalence of “traditional” and “outmoded” styles of teaching. “Chalk and talk” teaching strategies, largely aimed at verbal recall of factual information and definitions, are described as characterising pedagogies in Tanzania (Ibid, Country profile, United Republic of Tanzania, p. 13). The *modus operandi* in Uganda is said to revolve around a traditional (predominantly behaviourist) model of curriculum and instruction rather than, for example, one based on the development of meaning. Inquiry-based teaching and practical applications of science to real life are all seen as missing from teachers’ pedagogical strategies, rendering teaching and learning mainly “theoretical” (Ibid, Country profile, Uganda, p. 25). In Botswana, “the read-regurgitate-recite learning cycle” prevails despite a formally sophisticated competency-based and learning-centred curriculum (Ibid, Country profile, Botswana, p. 34). In Ghana, as in other countries, “lessons ... are almost exclusively teacher-centred, and content-driven” (Ibid, Country profile, Ghana, p. 19), even though many educators feel that not even the potential of teacher-centred education is fulfilled. Despite Namibia’s learner-centred curriculum, “a learner-centred pedagogy ... is frequently operationally absent” (Ibid, Country profile, Namibia, p. 31). Nigeria also promotes the learner-centred ideal, “but the implementation ... has often been far from the ... ideal” (Ibid, Country profile, Nigeria, p. 31). Assessment in Senegal, as in the majority of countries, is still examination-driven and led, and focused on recall and memorisation rather than learning and understanding. The gap between policy and practice, as in these West, East and Southern African contexts, are familiar also in South Africa, where the learner-centred goals of outcomes-based education – the educational philosophy here – are proving far harder to achieve in practice than in policy (see, e.g., Harley & Wedekind, 2004).

In order to understand this gap between policy and practice, it is necessary to back-track briefly and understand how learner-centred education has been understood. The idea of learner-centred education derives from the works of mainly Jean Piaget (although Piaget is sometimes interpreted as a stage theorist only), John Dewey (1938) and Lev Vygotsky (1978). Contemporary understandings of learner-centred education are based mainly on Vygotskian cognitive psychology, and differ from pedagogies based on behaviourist psychologies. In constructivism, knowledge about the structure and processes of learning is relevant for learning in general. Learning is understood as a permanent and lifelong process occurring in a variety of social settings, of which formal schooling is just one aspect. Learner-centred education is more specific about

the understanding of the nature of learning, and less specific on the pedagogies and detailed provision of outcomes in formal schooling. Its origin and ambiguities also allow a variety of different understandings that go beyond the classroom.

In spite of the apparent similarities, there are differences between learner-centred, child-centred and outcome-based education. For some writers, child-centred education was a reaction to, and development from, strong behaviourist pedagogies and is based on a different epistemology from learner-centred education (van Harmelen, 1998). In terms of learner-centred and outcome-based education, learner-centred education can be argued to be input-related, whereas outcomes-based education is output-related. Learner-centred education is more focused on teaching and instructional quality, whereas outcomes-based education is more focused on the quality of assessment. Learner-centred education is a pedagogical philosophy about teaching and learning, applicable to learning in general but academic education more specifically. Outcomes-based education primarily provides a framework of outcomes and an approach to knowledge-integration, and is only secondarily concerned with curriculum knowledge, pedagogies and learning-support materials. Outcomes can be behaviourist and achieved by child-centred education. Important for the purposes of this article is the essential ambiguity in the concept and between the different meanings, despite the fundamental differences that are said to underlie them.

The contested meanings of learner-centred education as expressed in outcomes-based education can be illustrated through its application in South Africa's post-1994 curriculum 2005. Outcomes-based education as a philosophy has been differently interpreted by different writers. There are few educationists in South Africa who have not taken a stance either for or against outcomes-based education. Writers such as Mohamed (1998), Malcolm (2000) and Odora-Hoppers (2002) have defended outcomes-based education, whereas others such as Kraak (2001) have been moderately critical, and yet others such as Jansen (1997, 1998, 1999, 2002, 2004), Jansen and Christie (1999), Muller (1998, n.d. c2001), Muller and Taylor (1998) and Unterhalter (1998a) have questioned its foundations. The nature of the debate has also shifted over time. The debate has polarised people who, to all intents and purposes, see themselves as, in one way or another, 'educational progressives'. Thus, it has been possible for some to see outcomes-based education as a narrowing and de-radicalisation of educational goals, and for others to see it as expanding and revolutionising them; for some to see it as permitting the play of difference, and allowing local, hidden knowledges to surface; for others to see it as yet another form of universal knowledge which stamps upon these; for some to see its learner-centred focus as allowing greater possibilities to the poor and others to see it as an educational romanticism which has the effect of denying the poor real learning opportunities (see above).

Its effect in international and comparative context has also been seen, in some cases, as integral to competency-driven, marketised forms of knowledge, and in others as promoting forms of knowing which contest these. For some, outcomes-based education has 'worked'; in others, it has not. Its centrality to South Africa's National Qualifications Framework has been less often debated. Early on, however, the NQF was identified as constraining educational goals to serve narrowly economic ends (Samson & Vally, 1996; Unterhalter, 1998b; Muller, 1998) rather than, as claimed, integrating education and

training. Outcomes-based education is thus the ultimate ‘floating signifier’, meaning different things to different people, who invest it with diametrically opposed qualities. As a construct of social possibility and/or limitation, it speaks to public and private desires and relationships to the emerging social order. But seeing it as this purely symbolic social construct also militates against an understanding of the material effects of the multiple social dynamics, processes and struggles of which it is a part and in which it is finely imbricated (see Chisholm, 2003, for further discussion of this aspect).

External Pressures and Conditions

Learner-centredness, outcomes-based education and the idea of the National Qualifications Framework have both international and local historical roots. We will first examine the international pressures and conditions ensuring take-up in policy discourse and then go on to explore the specific Namibian and South African contexts in more detail.

Since 1990, the goals and purposes of education in sub-Saharan Africa have been reshaped by four interconnected developments: globalisation; the changed focus of international aid agencies towards development assistance; the adaptation of sub-Saharan African countries to the new world order with its new political emphases; and the spilling over of new pedagogical ideas from the USA and Europe into sub-Saharan Africa. The latter resulted from development-export on the part of the Western world, development import from sub-Saharan African countries as well as increased international communications. Independently of the origin, the implementation of both learner-centered and outcomes-based education has, to all intents and purposes, not occurred in the way intended.

Despite differences between them, learner-centred and outcomes-based education is part of a discursive repertoire of international rights and quality education. This amalgam of ideas is broadly shared amongst multilateral and donor agencies. UNICEF, in particular, has vigorously promoted rights-based and child-centred approaches for several decades, as have UNESCO, donor-agencies and international NGOs (see also Tabulawa, 2003). National Qualifications Frameworks are not explicitly part of this body of curriculum ideas, but are nonetheless part of an international discourse that has been appropriated in the African context and that has implications for curriculum and education systems. The majority of sub-Saharan African countries are signatories to a number of conventions on education, including the Convention on the Rights of the Child (1989), the World Declaration on Education For All (Jomtien, 1990), the Dakar Accord and Millenium Development Goals (April 2000). These spell out collective commitments by nation states and international agencies on the achievement of education development goals and bind sub-Saharan African countries to changing educational policy and practice in order to realise them. In so far as sub-Saharan African countries are bound to quality education, amongst other things, by the Convention of the Rights of the Child, the Jomtien Declaration, the Dakar Accord and Millenium Development Goals, attention is focused on curricular policy and practice.

The Jomtien call for access, equity, quality and democracy in education was accepted with little resistance in sub-Saharan Africa (Chisholm *et al.*, 1998). Its egalitarian thrust

was appealing and its achievement appeared to promise both social and economic development: the undoing of previous social injustices, and the achievement of economic growth that would bring benefits to citizens. Social and economic development, it was believed and continues to be so, requires educational change, and educational change is necessary for social and economic development. Educational change, in turn, is perceived to depend on, amongst other things, changing classroom practices through learner-centred education. The willing adoption of these ideas through top-down pressures and bottom-up desires account in part for the appropriation of ideas current within the international arena. In Southern Africa countries such as Namibia and South Africa in particular, the Jomtien call for equity chimed with the social, political and economic goals of post-apartheid governments.

Improved quality in education was widely perceived on the one hand as a necessary adaptation to the new knowledge requirements of globalisation and on the other, as meeting popular needs for improved schooling (ANC, 1994; Namibia Ministry of Education and Culture, 1993). On the one hand, the progressive appeal of the epistemological idea of learner-centredness seemed to fit well with development ambitions, and found favour amongst a broad array of social-educational interests. On the other hand, the National Qualifications Framework, first implemented in South Africa (1995) and Namibia (1996), appealed because it was thought it would bring social and systemic benefits: A National Qualifications Framework would form the educational 'ladder' out of poverty, low skill and unemployment, and open doors into prosperity, high skill and full employment. The route to this would be the integration of education and training through competency and unit-standards-based curricula (see ANC/COSATU, 1993; ANC, 1994).

In almost all sub-Saharan countries, however, curriculum reform is also mandated through the social sectoral education components of Enhanced Structural Adjustment Facilities' loan conditions. In general, the focus of structural adjustment packages is on cost-containment, reform of the public sector, privatisation and removal of tariff barriers. Poverty reduction strategies are a vital means by which structural adjustment packages are implemented. Educational reform is part of poverty reduction strategies, and entails measures intended to improve access and quality of education. Curriculum reform becomes part of the educational component of the structural adjustment package through the implementation of Universal Primary Education, as in Uganda (IMF, 1998); the Basic Education Master Plan and Secondary Education Master Plan, as in Tanzania (IMF, 1999); the 5-year Education Sector Strategic Plan (ESSP) for primary and secondary education for 1999–2003, as in Mozambique (IMF, 1999) and the improvement of the quality of schooling, as in Malawi (IMF, 1998/99). Malawi's Second Development Plan 1985–1995, for example, stipulated a number of reforms aimed at renewal and reorganisation of the public sector; its educational proposal included a requirement for a shift to 'methodology-centred and competency-based instruction'. Its Enhanced Structural Adjustment Facility Policy Framework Paper for 1998/99–2000/01 specifies the review and revision of the curriculum and establishment of exit points from the system (IMF, 1998/99). Significantly, these proposed shifts and changes occurred shortly after similar reforms were introduced in South Africa. Joint IMF-government teams arrive at agreements on the components of the

loans. All major donor agencies and international organisations are centrally involved in implementation of the range of activities for which loans are granted and on which agreement has been achieved.

Internal and External Processes and Conditions

In the southern and eastern African region, new learner-centred ideas were to some extent also a repackaging of ideas that had been in circulation in previous decades, caught up as the region had been in various national liberation and anti-colonial struggles. On the assumption of power, national liberation movements initially made strenuous efforts to overcome the legacies of colonialism. Independence was achieved at different times in the region: Botswana, Lesotho, Swaziland, Zambia, Tanzania, Malawi and Mauritius in the early and mid-1960s, Angola and Mozambique in 1975, Zimbabwe in 1980, Namibia in 1990 and South Africa in 1994. This staggered process of achieving independence influenced the nature of the regional political economy considerably throughout the 1970s and 1980s.

Before the early 1990s and independence in Southern Africa, Namibian and South African liberation movements found homes in neighbouring states such as Botswana, Mozambique, Tanzania, Zambia, Zimbabwe and Angola. Here, in anticipation of future liberation, there was some experimentation with alternative ideas to forms of education developed under colonialism and apartheid. Originating in Botswana, the idea of Education with Production spread through interaction between independent African countries, SWAPO, the ANC, Frelimo. In Tanzania, the ANC's Solomon Mahlangu Freedom College wrestled with similar ideas. Educational ideas that were to inform post-1990s approaches thus took shape in contexts where "strands of Africanism, social-democratic and various forms of Marxist socialism, and non-racialism" interacted in a complex mix (Morrow *et al.*, 2002, p. 156).

Probably spilling over from international pedagogical discussions, learner-centred education emerged as the driving pedagogical ideal for contemporary curriculum reform in the early 1990s. Learner-centred education was officially adopted in many African countries in the 1990s, and, in spite of national differences in stronger or weaker attachment to reform attempts, implementation (or rather lack of it) has shown similarities in the challenges experienced. In the following we attempt to trace the emergence of learner-centred education in Namibia (and outcomes-based education in South Africa) as the most prominent and widely favoured educational ideal. In tracing the origins, actors and processes of implementation in one specific context, we can begin to understand some of the reasons for the gap between policy and practice.

Learner-centered education as official part of curriculum reform in sub-Saharan Africa seems to have first started with the introduction of the subject of Life Science in the newly independent Namibia in 1990. Although learner-centredness was in hindsight explicitly identified only in 1998 and not at the beginning of the large-scale implementation process in 1991 as the theoretical base of Life Science, it was the vehicle chosen to drive the process of political reform to achieve access to education for all, equity, education for democracy and democracy in education (Leyendecker,

2002; MEC Namibia, 1993, pp. 32–42). The subject Life Science itself was meant to spearhead not only the educational reform process, but also the social reform intended to eliminate the racial inequalities characterising pre-independence education. Life Science in Namibia was based on concepts of social constructivism, or the pedagogical translation of it – learner-centred education.

Historically linked to pre-independence SWAPO exile education in Loudima, Zambia, Danish development aid drove the development and implementation of Life Science in Namibia. The idea of Life Science was strongly influenced by the social-democratic values and philosophies of the Danish advisers, and was based on experiences with Education with Production (EwP) in Zambian schools. It strongly supported the political goals of post-independence SWAPO. The Danish programme advisers and the progressive ideals of the newly developed subject Life Science had an open ear from the then Minister of Education, Nahas Angula.

The idea of Education with Production was popularised in the region by Patrick van Rensburg, a former South African diplomat who renounced his allegiance to apartheid, became a Botswana citizen in 1973, founded the Swaneng Hill School and subsequently two others in association with the Botswana government, as well as the Swaneng Consumers Cooperative and Brigades Movement. Van Rensburg's approach drew on then-popular socialist ideas that aimed to combine Education with Production in order to more effectively link theory with practice, and in so doing, to ensure more effective learning, doing and understanding of production in its social context. As such, it also aimed to break down the social division between mental and manual labour that was seen as characteristic of all elitist, class-based and colonial forms of education.

The brigades curriculum included practical as well as academic subjects such as Development Studies, which encouraged students to apply their knowledge and skills in socially useful productive work. The Brigades were self-help education and training organisations producing goods and services both for themselves and for public sale to help finance teaching and training. The success of the experiment resulted in the establishment of the Foundation for Education with Production in 1980 which sought to spread the idea regionally and internationally through publications and conferences that drew together Ministry officials, liberation movements, non-governmental organisations, teachers' institutions and the "world of work" (<http://www.rightlivelivelihood.org/recipe/van-rensborg.htm> as at 12/12/2005; van Rensburg, 1978; Seidmann, 1985). The Zimbabwe Foundation for Education with Production (ZIMFEP) was founded in Zimbabwe shortly after its independence in 1980, and followed the same principles (see McLaughlin *et al.*, 2002). After 1994, the Foundation initiated activities in South Africa, but in the new climate of reform, the pedagogical ideas were very much under the shadow of the National Qualifications Framework with its emphasis on competencies and qualifications.

Throughout the 1980s there was a rich exchange of ideas across regional and international boundaries on the concept and its implementation. The journal, *Education with Production*, edited by John Conradie, Patrick van Rensburg and Frank Youngman, and published in Botswana, provided a focus for this critical debate over the decade. It examined the historical, comparative and international dimensions, as well as the theoretical and practical problems involved in its implementation in both capitalist

and socialist countries across the developed and developing worlds. The journal drew contributions on production in schools, education and employment, technical and vocational education and training, and adult education from as far afield as the Soviet Union, Latin America, Africa, Europe and the USA. Authors comprised a 'Who's Who' of the comparative education field: Kazim Bacchus, Joan Simon, Manning Marable, Kenneth King, Wim Hoppers, Fay Chung, Claudio de Mouro Castro and Antonio Cabral de Andrade, Stephen Heyneman, John Middleton, Alan Fowler, Daniel Sifuna, Neil Parsons, David Stern and Julius Nyerere, all appeared in its pages at one time or another. The journal self-consciously promoted articles that drew on conceptual approaches to teaching and learning that were based in the work of Luria and Vygotsky to critique dominant behaviourist approaches to 'learning theory' (see, e.g., Simon, 1986). The approach emphasised the relationship between consciousness and activity, learning and doing, context and practice.

Education with Production or polytechnical education in the African contexts of Zimbabwe, Tanzania and Botswana was "seen as a means of bringing about radical or socialist transformation" (Botha, 1991, p. 207). In none of these countries, however, was EwP universally implemented. As Botha shows, in Zimbabwe there were only eight EwP or ZIMFEP schools, largely based in the rural areas (p. 207). Nonetheless, its conception "assumed considerable importance as the point of departure for education policies in many African countries and, indeed, also in South Africa" (amongst those intellectuals and activists in exile and inside the country striving for an alternative to Bantu Education). EwP was a philosophy "permeating the curriculum". In his critical analysis in 1991 of its prospects for South Africa, Botha contrasts the EwP approach which sees education as an instrument of social transformation with one that recognises the constraints on its ability to achieve such transformation: "curriculum changes in themselves", he says, "cannot play the role that the advocates ... suggest. The social conditions in which these changes are made determine the extent to which they can advance the process of transformation" (Botha, 1991, p. 210). In Zimbabwe, itself, there seems to have been some awareness that "the declaration of the policy does not necessarily go hand in hand with the definition of the fine details needed for implementation". (ZIMFEP, n.d.) It is interesting that despite this awareness amongst analysts and implementors, curriculum still, in the post-1994 Southern African context, came to carry the weight of achieving broader social transformation goals (see, e.g., Harley & Wedekind, 2004).

The trajectory of implementation of learner-centred ideas in Namibia in the early 1990s provides an example of how the EwP ideas altered over time. It also further illustrates the distance between the ideas and their realisation in practice. In the 1980s, notions of EwP were taken up in SWAPO's exile school in Loudima, Zambia. Loudima was influenced by the idea of the Zimbabwe Science (ZimSci) syllabus (see, e.g., CDU, 1987), ZimSci having borrowed the initial idea from the van Rensburg brigades in Botswana. In Zimbabwe, European teachers (and probably NGOs) sympathetic to Zimbabwean independence, like many others, were attracted by the notion of self-help and the idea of EwP. The very idea of EwP is close to ideas of contextualised and culturally relevant learning. Although learner-centredness was only later consciously spelled out as the pedagogy underlying Life Science in Namibia, the link to learner-centredness was a relatively organic one.

The Danish-guided implementation of Life Science in independent Namibia was clearly structured and planned. The implementation process was well resourced and supported over a period of 8 years. In addition, and what probably counted the most during this period, the dedication and motivation of the NGO, the Danish advisers, and Namibian staff was infectious to many in the educational system – that is, if they were supporting the political goals. Those opposed to the political goals in the education system (and who probably still dominated the system) resisted Life Science and learner-centred education because of its close link to the political aims of social transformation. However, when signs emerged that learner-centred education in Namibia was failing, it was not due to this resistance. Nor did it fail because of lack of resources, and probably not even because of capacity shortages. The main obstacle seems to have been the unclear nature of the understanding and the actual application of learner-centred education, and the scope of the intended change that focused on the high pedagogical ideal. As sound as the implementation process was in many places, it failed to transport the understanding of learner-centred education into classrooms.

The signs of poor understanding, subject content and methodological knowledge amongst teachers were many. The idea of contextualised biology teaching was often reduced to gardening, and real-life dissections were conducted at the blackboard, away from where students could see what was going on. When chickens were not available for dissection, no alternatives were found, although they were available. Dissection simply did not happen. Supplies such as chicken mesh and garden tools started to disappear or boxes of chemicals simply remained unpacked in storerooms or were lost, their uses not properly understood. Overlaps in the curriculum were not recognised, and the curriculum consequently modified or built upon; the same thing was simply taught twice. Whether this was culture or context or both, there was little understanding of what was expected to be implemented.

The reasons for its failure to take root were varied. Researchers have argued that instructional methodologies (and partly the syllabus content of Life Science) were not consonant with local, culturally determined classroom practices (Geckler, 1999; Leyendecker, 2003). The gaps that had to be bridged between existing classroom realities, social expectations of education and learner-centred education were simply too wide to be achieved in one step. To a certain extent, the implementation of learner-centred education seems to have been restricted because the Danish ideology of liberated education did not fit the Namibian version of it. In the end, little of the well-meant classroom intentions (and development goals) materialised in practice (IBIS, 2000; Geckler, 1999).

In South Africa, learner-centred education as a pedagogical ideal had already existed during the apartheid years in some progressive independent schools such as Sacred Heart College in Johannesburg, in non-governmental organisations such as SACHED (the South African College of Higher Education), and in the practices of new teacher organisations such as NEUSA (the National Education Union of South Africa), one of the predecessors of the South African Democratic Teachers' Union. Harley and Wedekind argue that it was also promoted in the White Natal Education Department before 1994 (Harley & Wedekind, 2004). In the new South Africa after 1994, learner-centred education together with outcomes-based education and the

National Qualifications Framework was meant to undo the injustices of apartheid education once and for all.

The borrowing and indigenisation process in South Africa followed a different trajectory from that of Namibia. This has been so extensively researched and analysed elsewhere, that only the main outlines will be provided here (see Jansen, 2004, pp. 206, 207; see also Spreen, 2004; Govender, 2004). Close links between the trade union movement, COSATU, the National Training Board and individual curriculum developers in the run-up to elections in 1994 ensured that a mix of ideas linked to integration, competency and outcomes-based education were adopted from Australia and translated into the schooling terrain. Although there was little, if any, initial discussion or consultation with teachers, the South African Democratic Teachers' Union subsequently became advocates of outcomes-based education as the philosophy of a post-apartheid educational dispensation. Although teachers strongly supported the intended direction and goals of curriculum change, mounting criticism led to its review and revision in 2000 and 2002 respectively (Chisholm *et al.*, 2000). This first implementation attempt of the curriculum based on the NQF, OBE, and learner-centred education, encountered so many problems that the curriculum was considered not-implemented (Jansen, 1999). Similarly, the National Qualifications Framework of South Africa was increasingly criticised for not fulfilling its mandate. It, too, was reviewed in 2002. As with the curriculum, there has been some scaling back of ambition, if not the intended goals (McGrath, 2005). As with the curriculum, resistance and criticism has come from intellectuals; amongst implementers and practitioners, there has been resistance, compliance and mimicry (Harley *et al.*, 2000).

In South Africa, the main reasons for the problems faced in indigenising learner-centred education (and OBE) appear to be comparable to those in Namibia: confusion about the meaning and content of the concepts and intended changes, and the consequences of the intended instructional practices not being of-a-piece with local classroom cultures and realities. In the case of the National Qualifications Framework, there also appears to be an incompatibility between goals and realities. In South Africa (as elsewhere), further implementation problems arose with outcomes-based education because of lack of resources and capacity, and shortcomings in the curriculum design. Ironically, former White schools, although probably opposed to the political agenda, initially had fewer problems in implementing learner-centred education since they felt they had been teaching close to the intended instructional methodologies for some years, although many were also adept at giving the appearance of change while maintaining the status quo. Former Black schools, although supporting the political agenda, appeared unable to implement learner-centred education. Where they attempted to do so, the meaning of what was to be achieved in some cases led to a travesty of the intended meaning of it (Jansen, 1998, 1999; Jansen & Christie, 1999; DOE, 2000). This reduction of the understanding of what learner-centred education is and does has also been associated with extremely poor literacy and numeracy achievements in those grades where outcomes-based and learner-centred education have been implemented (Taylor & Vinjevd, 1999; Muller, 2000). A sharp reaction to constructivism and learner-centred education has accordingly characterised many responses to outcomes-based education.

It is clear from the above that one of the legacies of the pre-1990 period and context is a degree of educational and pedagogical experimentation. This did not, however, post-apartheid, appear to have entered the formal schooling systems. One of the possible reasons must be that these experiments of changing practice in classrooms through learner-centred education barely touched the majority of schools. Here the main concerns lay elsewhere.

Both the fact that these ideas are not new and in some isolated instances may even predate independence in sub-Saharan African countries, and that they have seldom penetrated the broader educational system in any significant way, echoes US scholarship on the lack of impact of successive waves of reform on classroom practices over the past century (Cuban, 1990). In sub-Saharan Africa as much as in the USA, as Cuban has shown, dominant social groups have again and again turned to schools and education to solve intractable social and national problems, rather than directly addressing those major social problems themselves. In sub-Saharan Africa, as much as in the USA and probably Western Europe as well, there is also an enduring belief in the ability of schools to promote social mobility, create national harmony and responsible citizenship, a belief that is harnessed during all major periods of social change to the reform of education, despite evidence that schools seldom achieve these goals (Cuban, 1990, p. 9; Vavrus, 2003). The problems of taking progressive educational ideas to scale also appear to be as much an African as an American or European challenge (Elmore, 1996).

In both the Namibian and South African contexts, it has been easier to identify what needs to change and attempt to mandate this change from above, than to identify and ensure the conditions necessary for their successful implementation. Research on these issues is however sparse for sub-Saharan Africa. Much more research is needed on the gap between policy and practice, implementation and what has changed over time, how and why.

Understanding the Challenge

Outside South Africa and Namibia, learner-centred education has dominated contemporary official curriculum reform attempts across sub-Saharan Africa. Learner-centred education is considered to be one of the principal vehicles to drive societies and economies from mainly agricultural bases into modern and knowledge-based societies with attendant economic benefits. Advised and supported by multilateral organisations advocating the need for different and better learning outcomes, learner-centred education is accepted as the pedagogical ideal to facilitate this change.

While the need for different and better learning outcomes are undisputed in all sub-Saharan African educational systems, evidence from Namibia and South Africa suggests that the scope of the change is as underestimated as the differences of understanding of concepts. Local cultural and contextual realities and capacities as much as implementation requirements influence understanding and possibilities. Often learner-centred

education is attractive to policy-makers because of the appeal and promises of the social goals attached. African policy-makers can prescribe learner-centred and competency-based education and invest it with particular meanings that vary from those of their international counterparts. (Samoff, 2005; Leyendecker, 2005) These differing meanings are contested, accounting in part for challenges in implementation. To understand the problems experienced with learner-centred education, it is important to distinguish between the idea of learner-centred education as panacea (see also Vavrus, 2003), and the interlinked approach to implementation. It is also important to note that implementation challenges are not necessarily restricted to learner-centred education, but that they are a general feature of other curricular developments as well. In the case of learner-centred education, OBE and NQF, problems are aggravated by conflicts over meaning.

Two approaches can be identified in understanding what needs to be done. From one perspective, teachers need to understand the underlying idea, be motivated to change practice, adapt and apply appropriate pedagogies, and have the capacity to do it. (Elmore, 2001, p. 16) A sense of ownership is important but on its own, as shown in the South African case, it may not be enough to change practice (see McLaughlin, 1991, for discussion of the idea). From another perspective, more attention needs to be paid to ensuring opportunity to learn in classrooms, especially in working-class and poor schools, through addressing teacher knowledge and pedagogies that militate against learning (Hoadley, 2007, 2008; Reeves & Muller, 2005) or, as Jansen (2005b) has proposed, placing “teachers, texts and time” at the forefront of any strategy for change.

In conclusion, this article has attempted to examine the gap between policy and practice in curriculum change efforts in sub-Saharan Africa and paid specific attention to the Namibian and South African experiences. Far from learner-centredness being imposed, it has shown that the ambiguities of the idea, international pressures and local histories all help to account for local receptiveness to the idea. The article shows that while there is convergence around the ideas and purposes they are intended to serve, there is also evidence of divergence in practice in the extent to which they are able to meet the goals attributed to them. In practice there is considerable convergence in the divergence: ideas are recontextualised and displaced, unable in the majority of instances to meet the social development goals demanded of them. In most instances, dominant modes of teaching and learning in practice appear to converge in ways that affirm complex cultural practices as well as multifaceted contexts (Stambach, 2000; Vavrus, 2003; Crossley & Watson, 2003; Watson, 2001; Carnoy, 2000; Samoff 1999a, b, 2001; Steiner-Khamsi, 2004; Tikly, 2004; Coe, 2005). What this suggests is the need for a great deal more research on the local responses and sources of receptiveness and resistance to global ideas.

GENDER AND EDUCATION IN DEVELOPING CONTEXTS: POSTCOLONIAL REFLECTIONS ON AFRICA

Deevia Bhana, Robert Morrell, and Rob Pattman

Introduction

Two of the most pressing educational concerns in sub-Saharan Africa – violence and HIV/AIDS – are directly related to the ways in which gender is socially constructed. In developing contexts gender has stubbornly remained a one-sided topic with the focus firmly (and justifiably) on the plight of girls in schools. In the African context where girls have often been marginalized, the benefits of education including increased economic opportunities, smaller families and its role as a “social vaccine” against HIV are well documented. Yet, in many African countries, access to education is curtailed by lack of resources and the question of quality of education has been raised as an important reason why girls continually lack the skills and confidence to make appropriate choices in environments that are plagued by unemployment, poverty, violence, conflict and HIV/AIDS. Schools are not safe places for girls and most of the gender analyses focus on the ways in which sexual violence manifests in school sites hindering and harming the education of girls. The focus on boys on the other hand and the construction of masculinities as a gendered construct has been largely absent from the literature on gender and education in development discourse. Where the focus has been present the construction of violent masculinities has received attention (Morrell, 2001). In industrialized and developed economies, research on gender and education has focused on boys, with a great deal of attention being given to the crisis of masculinity and feminist gains at the expense of boys. In this writing, boys have been presented as gendered victims who need support. This is in contrast to writings about boys and men in Africa who have often been demonized and seen as potentially dangerous. Recently though, an approach in gender and education in sub-Saharan Africa trying to shed light on the construction of masculinities and their complex relationship to socially and materially impoverished contexts ravaged by HIV/AIDS is emerging. These analyses generally conclude that violent and hegemonic forms of masculinities within resource-poor contexts nurture unequal gender relations and it is usually boys and male teachers that use violence. Girls mainly suffer the consequences of violence in school. Similarly, most reports on HIV/AIDS focus on how girls are made vulnerable to the disease by a rampant heterosexual masculinity. Girls account for nearly 60% of HIV infections in sub-Saharan

Africa (UNAIDS, 2004). Given that gender identities and processes are related to high rates of violence and HIV/AIDS in sub-Saharan Africa, educational approaches have begun to focus on the meanings that boys and girls give to their gendered identities in the attempt to address the problems associated with rigid definitions of masculinity and femininity and to find ways of increasing the possibilities of upholding peaceful gender identities. To this end sex and HIV/AIDS education is now premised on working with the lives and identities of children and youth in schools to create alternate possibilities of doing gender analyses. This chapter argues that in the context of violence and HIV/AIDS a more sophisticated gender analysis is beginning to emerge in sub-Saharan Africa that requires us to understand how both boys and girls are made vulnerable to rigid notions of masculine and feminine hierarchies. It seeks to explore two key questions. First, how does a focus on masculinities help better to understand school boys in sub-Saharan Africa? And second, in terms of HIV/AIDS, what are the implications of gender-specific realities and vulnerabilities of boys and girls and how might these shifting and changing gender identities be used to enable education to embrace and promote gender equity.

In this chapter, we take the perspective that gender is socially constructed, fluid and open to change across different social settings. Whilst there is no single version of masculinity and femininity, a version of masculinity which has great currency in the sub-Saharan African context is one that demands respect, fosters gender violence and increases girls' vulnerability to HIV/AIDS. Material impoverishment is a key contextual factor for working with boys and girls in developing contexts, limiting the opportunities to create better gender relations. However, gender is fluid, and changing means that education is critical in working with boys and girls to change ascendant versions of gender.

Boys, Masculinities and Schooling: Violence as an Issue of Schooling

Studies of masculinity and education in developed contexts have been dominated for the last decade by a debate about a "crisis of masculinity". Before asking the question "does this framing have relevance in developing contexts?" it is important to identify various elements of the "crisis of masculinity" literature.

In the first instance, the debate is essentially about gender politics. One position holds that feminist successes in schools have led to the improvement in the fortunes of girls to the detriment of boys. Schooling has been feminized and boys emasculated. A backlash politics has emerged which demands an increase in the numbers of male teachers, a review of the curriculum and other remedial steps to assist boys at school. The backlash is often explicitly anti-feminist. An opposing position argues that there is no crisis of masculinity, and that boys are still well treated and are doing well in schools. They note that in terms of resources and facilities, boys still tend to get preference at schools and that even if some girls have overtaken boys in terms of academic performance, overall most boys are still doing well. Feminists point out that girls still battle to convert improved academic performance into labour market benefits where women continue to earn less than men in comparative situations.

In the second instance, there are debates about the gendered state of education. While the media have seized on stories of school violence, suicide, attention-deficit hyperactivity disorder and the relative decline in the academic performance of boys, to construct an impression of a “crisis of masculinity” there have been studies to try and assess the relative fortunes of boys and girls in education. In a very careful study of teaching and teachers in the UK, for example, Thornton and Bricheno (2006) argue that there is no evidence that increasing the number of male teachers would improve the performance of boys and in fact point to evidence that suggests that boys are well served by female teachers. In a very careful assessment, again of the UK, Arnot, David and Weiner (1999) show that while state-led gender reform has helped to improve the performance of girls (especially in subjects such as science and maths), no gender revolution has occurred and the educational fortunes of boys have not been jeopardized.

The third feature of the “crisis of masculinity” debate has been the recognition that there are some boys who are doing worse. These are generally working-class boys or those belonging to ethnic and racial minorities (Sewell, 1997). Changes in the labour market have undermined access to jobs especially amongst the working-class youth and this has contributed to a variety of problems for the young men themselves and for society more widely. These include laddism, forms of violence, involvement in crime and anti-social behaviours (McDowell, 2000; Nayak, 2003).

How Do These Debates Transfer into Developing Contexts?

The major educational challenge in developing countries remains to provide access to education for young people. Such goals generally involve recognizing current inequalities where boys are favoured to the detriment of girls. With very few exceptions, the percentage of boys in primary school in the developing world exceeds that of girls (Seager, 2003, pp. 112–119). The quality of education offered to boys and girls is also by and large biased in favour of boys with some of the most obvious indicators being levels of dropout due to pregnancy and the increasing gap between the attendance and performance of males and females as one ascends the education ladder. In most developing countries, male university attendance exceeds that of females. These inequalities provide justification for countries to pursue girl-promoting gender policies in education, yet at the same time, these policies are seldom pursued energetically and generally not to the point where men could argue that school-going boys are being discriminated against.

In societies that are embracing human rights agendas which in turn contain traces of feminist agendas, policies to promote the academic interests and educational fortunes of girls are being made. In some cases such as in South Africa these are being generated by the state, in other cases, they have their origin in the work of NGOs (such as Camfed which in countries like Zimbabwe have been promoting schooling for girls) and in initiatives such as the DfID Beyond Access programme which has sought to improve retention rates for girls in countries like Bangladesh. Have these programmes had a deleterious impact on boys and contributed to a “crisis of masculinity”? There seems little evidence of this. However, there are a number of reasons why the issue of boys and education in developing contexts should be taken seriously.

The example of South Africa can illustrate some of these points. Possessing the biggest and most dynamic economy of the region and fresh from the triumph of ending the racially discriminatory system of apartheid, the country has passed a constitution and bill of rights that prohibit discrimination on grounds of gender and sexual orientation. At the same time it has committed itself to attacking poverty, a goal that critics believe is jeopardized by policies that are more concerned with tackling inflation and attracting overseas investment than with creating jobs. Unemployment thus remains at very high levels (officially around 25% but in reality higher). Since the turn of the millennium, women's share of the formal labour market has risen. The performance of girls in schools has improved. On the other hand, for the first time, the number of boys dropping out of school exceeds that of girls. Crime levels are exceedingly high (on average there are 19,000–20,000 murders a year in national population of just over 40 million) and much of the crime is committed by young African men. Levels of domestic violence and rape are amongst the highest in the world.

The effects of globalization (e.g., the collapse of the labour market) on third-world economies has created conditions for the emergence of marginalized masculinities around the world (Barker, 2005; Guttman, 2003; Morrell, 2001; Ouzgane 2006). With little prospect of work and apparently unwilling or unable to enter subsistence (second) economies, many men abandon families and other support structures and surrender to alcoholic despair, drugs and sexually risky lifestyles (Silberschmidt, 2001).

Men on the margins pose dangers for national peace and security. Their access to weapons increases the risks of war and strengthens hierarchical value systems which rest on and perpetuate gender inequality. These value systems also legitimate violent practices such as the killing of women in parts of the Islamic world where they are held to have shamed the family and honour codes.

Men who feel excluded are also a threat to development. This danger was not always appreciated. Development projects which specifically tried to promote women's interests often viewed patriarchy as the cause of women's subordination and therefore consciously attempted to exclude men, citing them as the "cause" of women's exploitation. But the limitations of women's upliftment and the Women in Development (WID) approach led to later Gender and Development (GAD) approaches which recognized the strategic danger of keeping men out of development work while also acknowledging the importance of thinking about men in gendered ways, which effectively meant problematizing masculinity (Cornwall, 1997; Cornwall & White, 2000).

Thinking about men in development contexts has not been uncomplicated. It has on the one hand generated inclusive gendered approaches towards issues such as violence, fatherhood and peace, all of which have been designed to get men to see beyond a narrow male-centred agenda that protects and promotes their power and to embrace values that contribute to gender equity (and the interests of community, women, children, the aged and so on). They have also encouraged men to engage in reconstructive, introspective identity work as part of a process to fashion "new men". These developments have, however, been complicated by material circumstances (joblessness and poverty) and struggles over resources within communities and families that have all too often ended in violence and have shown how precarious (and potentially recidivist) newly reconstructed masculinities can be.

Two questions have therefore been raised: if we are not to consider men and boys either as “a problem” or as “in crisis”, what should we consider them to be? And what should boys and men aspire to in order to fit into and contribute to society?

An answer to the former question lies tangled in questions about masculinity: Are there positive models of masculinity available in developing and postcolonial contexts? If so, what do they look like? (cf. Cleaver, 2002). But increasingly the interdependence of men and women and the importance of promoting gender harmony and cooperation are encouraging the inclusion of men and the consideration of issues of masculinity and undermining pathologizing discourses. Put another way, the destiny of women and men are tied together and it is important to theorize gender solutions in ways that pay attention to both men and women, their needs, their interdependence and the inequalities that may separate them and bring them into conflict.

There is also recognition that boys (and men) are not inherently violent even as it is recognized that violence is a serious and widespread problem in many schools (Leach, 2003). The focus has shifted from trying to protect girls from boys to understanding which groups of boys are most at risk of being involved in violence: which models of masculinity contribute to the legitimization of violence and how to intervene to prevent violence.

The correlation of poverty with violence is strong although the causal connections remain unclear. Where race, ethnicity, social class and age intersect we find young black males who are likely from an early age to become involved in violence (Barker, 2005). The violence takes many forms which include involvement in gang wars, crime, ethnic or national armed conflicts and intimate partner and domestic violence. In this latter regard, the violent masculinity has become a source of interest among those attempting to better understand and prevent HIV transmission which does occur in situations of gender inequality and sexual violence (see Pattman’s section below).

Educational work with young men has concentrated heavily on addressing the issue of violence. Whereas a fear of “a crisis of masculinity” in developed contexts has fueled attempts to improve the academic performance of boys and to make schools more boy-friendly, boys in developing contexts are not being treated as a group deserving of rescue. Rather, they are considered as a constituent part of the problems besetting education in the developing world, as well as potential beneficiaries of attempts successfully to address these problems (including violence, HIV infections, school dropout).

An unresolved issue that underpins ongoing concerns about boys and masculinity in schools is the lack of a clear connection between schooling and the world of work, the consequent poor prospects of employment juxtaposed with the enduring expectation that men should be providers. The history of men in the Third World is filled with their efforts to either enter the wage economy or to remain productively independent of it. Both efforts were generally predicated on the acceptance that it was their responsibility to provide for families. In most developing contexts, men find it difficult to fulfil the provider role. In South Africa this has led to huge numbers of men living away from their families and many seeking to escape their legal obligation to support their children (Wilson, 2006). As Mark Hunter (2006) has put it, in South Africa, there are many fathers who lack “*amandla*” (power). Some seek to meet their familial obligations by

turning to crime. What this situation reveals is a tension between what R. W. Connell has termed the patriarchal dividend and the structural weakness of men in developing contexts. Men may have power (physically or collectively) in relation to younger and older men and in relation to some women, disabled people, ethnic minorities and other marginal groupings, but their inability to secure their own reproduction costs means that they are also powerless in certain contexts.

A lack of material security is likely to remain a key contextual factor for boys and men in developing contexts and in a sense there is little they can do about the materiality of their situation. But they can and do have some control over the ways in which they construct their masculine identities and the school is a critical location of this work.

The incidence of HIV/AIDS and the efforts to contain and stop the spread of the disease in sub-Saharan Africa has made the argument of the school as a powerful location for addressing and changing behaviour compelling. The gender dimension of the disease is critical for understanding its impact and to the successful implementation of prevention programmes. The ways in which boys and girls construct their gendered identities and the ways in which education can address these constructions as well as focus on new ways of constructions are important to consider. We focus upon the work conducted in gendering of AIDS and how these issues might be addressed in schools in the next section.

AIDS and Gender, Gender and AIDS

Because of the coincidence between lower rates of HIV infection and higher levels of educational participation, education has been described in Southern Africa as a “vaccine” against AIDS (Coombe & Kelly, 2000). This would seem to be particularly true for girls. According to UNICEF (2004) more than two out of three newly infected 15–24-year-olds in sub-Saharan Africa are female, and this largely reflects tendencies for females to enter into (often coercive) sexual relations with older and more sexually experienced males. Girls who drop out of school early (and generally in sub-Saharan Africa girls drop out earlier than boys in part to take on domestic and caring obligations at home – made more pressing as a result of AIDS) are particularly vulnerable because they are more dependent on older, richer men than “more educated women” with better job prospects and greater value outside the home (UNESCO, 2003). Yet interview and ethnographic studies in schools in South Africa (e.g., Morrell, 1998, 2000; Human Rights Watch, 2001; Jewkes *et al.*, 2002; Bhana, 2005; Mitchell *et al.*, 2005; Kent 2004) and also in Botswana, Zambia and Kenya (Pattman & Chege, 2003), and Ghana, Malawi and Zimbabwe, (Leach *et al.*, 2003) have shown that schools are not safe places for girls and sexual harassment and violence are major and habitual problems many girls face at school. Not only do these studies point to the routine propositioning of girls by older male students as well as by male teachers, but also to the failure of school authorities to recognize and address this as a problem.

Much faith has been placed in developing sex educational initiatives in schools to provide young people with relevant knowledge and life skills to help them avoid HIV/AIDS. But if schools are places where girls are subordinated in relation to sexuality

it has to be questioned whether they are “appropriate places upon which to pin hopes of change”. This is the view of Alex Kent (2004) based on her detailed ethnography of a Durban school and the polarization of gender identities (heterosexual), subordination of girls through school beauty contests, sexual harassment, gendered forms of punishment and the unequal gendering of spaces.

Indeed there is evidence that sex education, as it is being taught in schools, may yet be another vehicle through which gender inequalities may be produced (either overtly promoted or implicitly reinforced) in relation to sexuality. Interview research with various schoolchildren and teachers in Kenya and Zimbabwe has suggested that sex education may be quite moralistic and didactic, blaming “promiscuous” people and especially women for AIDS, and working with the assumption that sexuality is reducible to a biological drive located mainly in males, and that young people ought to control this and young women ought not to “provoke” this. And observation of HIV/AIDS and life skills lessons in Kenya and Botswana revealed that girls were quiet, looked shy and uncomfortable and boys participated much more and received more teachers’ attention. (Pattman & Chege, 2003) While the popular “ABC” campaigns in many African countries, with the emphasis in schools on A, may not advocate sexual double standards, these have been criticized for their gender insensitivity and for lumping together males and females as if they are free individuals not caught up in gender power relations. Mitchell and Smith, for example, critique the ABC campaign for assuming girls have choice on whether to abstain or not or how many partners they and their sexual partners may have or whether to carry condoms, and ignoring the pressures emanating from structured gender and age inequalities for girls to enter into risky heterosexual relations.

But schools, as Mannah (2002) has argued, are potentially vital sites in the fight against HIV/AIDS partly because of young people’s daily contact with them and the availability of skilled staff, (or, we would add in relation to HIV/AIDS education, potentially skilled staff.) Pattman (2006) argues that it is precisely because schools are so implicated in producing gender power relations that school sex educational and teacher training programmes must be developed which are student-centred and gender-sensitive. They must make the lives and identities of students the key resources, and encourage students and teachers to reflect on the gender dynamics and power relations at school and in class and other contexts outside school and their own identifications and practices.

Indeed many sex educational initiatives targeting schoolchildren and teachers are informed by these concerns. Such initiatives are influenced by assumptions that gender identities are not fixed by “culture” or biology but are negotiated in everyday interactions, though also constrained by popular and long-standing discourses or narratives about gender and sexuality, and that there are different ways of being masculine or feminine (Connell, 1995). As Walsh, Mitchell and Smith (2003) argue, sex educators need to engage with young people as both producers and consumers of popular culture and constructions of gender, sexuality and HIV/AIDS. Activities using comics, photos and photography, drama and role-play have been developed with students and teachers to explore their and alternative constructions of gender, sexuality, violence, harassment and HIV/AIDS, and to encourage critical voices to emerge. For example: Storytelling

for a Change (2004), a project using and developing “comic stories” with students in South Africa; photo voice research conducted with girls on unsafe spaces in schools in South Africa (Mitchell *et al.*, 2005); “Opening our Eyes”, a module aimed at teachers and drawing, in part, on the photo voice work with the schoolgirls (Mitchell, 2004); developing and performing plays “designed to raise HIV/AIDS and gender awareness” in schools in South Africa (Morrell, 2004); making routine gendered performances (Butler, 1990) and bodily practices the topics of self-reflexive inquiry through role play in schools in Mozambique, Thorpe (2002); agony aunt role-playing games in Zimbabwe, Kaim, (2002). When used in sex educational programmes in schools, drama and role-playing may enable pupils to explore their (gendered and sexual) identities in a range of imaginary contexts outside the classroom where they may be used to presenting themselves in quite different and even contradictory ways. (Pattman & Chege, 2003).

In developing gender-sensitive forms of sex education, Pattman (2005) argues that we need to address masculinity and femininity in relation to each other precisely because these are not essences boys and girls possess which exist in isolation but are always constructed relationally. Sex education aimed at empowering girls and women but targeted only at them tends to reinforce assumptions that reproductive health is primarily their responsibility (Bujra, 2000) and males are more sexual or more sexually irresponsible. An alternative way of empowering girls is to encourage both boys and girls to reflect critically on the problems that arise for them and for the other sex as a result of enacting stereotypical constructions of masculinity and femininity. This assumes that females are not less sexual than males and that sexual abuse comprises not only, as Carol Vance (1984) argued so powerfully, sexual harassment and violence but also the policing and regulation of female sexuality. This may make it difficult for girls, constructed as responsible, to carry condoms (Campbell, 2003) or to stay out at night or wear certain kinds of clothes or even talk about their sexual desires (Pattman, 2005). It also assumes that it is in the interests of *both* boys and girls to develop less polarized and more egalitarian relationships – sexual and non-sexual – with the opposite sex. This is a position which draws on Bob Connell’s (1995) contention that hegemonic constructions of males as emotionally and physically tough and as possessors of a huge sex drive incur costs not only for girls, but for boys, generally, who try to live up to these: for example, anxieties about girlfriends rejecting them for older, richer and more sexually experienced boys and men, being unable to publicly express feelings of love and intimacy and fears about getting into fights with, and being bullied by, other boys. Such anxieties were expressed by boys in South Africa and Zimbabwe in individual diaries though not publicly in group interviews (Pattman & Chege, 2003).

In response to a “crisis of masculinity” in the West, centring around constructions of boys as sexually irresponsible, violent and anti-academic (see previous section), calls have been made by academics and politicians for stronger male role models as teachers and fathers (e.g., Biddulph, 1998) to encourage boys to develop a sense of self-control and responsibility (a position challenged by Thornton’s and Bricheno’s (2006) study in the UK, mentioned in the previous section). The problem with this view is that it assumes an essential masculinity which only male authority figures can model in a responsible way, a view very much at odds with the idea of gender as relational

advanced above. Taking gender as relational, Pattman (2006) has argued that male sex education teachers can act as very positive role models, not, however, by exemplifying conventional tough and authoritarian modes of masculinity but by subverting these. He draws on research (Pattman & Chege, 2003) which shows that male and female teachers in South Africa and Botswana, tended to be constructed by pupils in quite polarized ways as, respectively, authoritarian and caring, (see also Kent, 2004) and argues for the importance of male sex educators (trained to be gender-sensitive and student-centred) demonstrating how males can be sensitive, approachable and non-aggressive and develop close and caring relations with girls which are non-sexual and non-harassing.

Whether to address boys and girls separately or together is a contentious issue among those committed to gender-sensitive forms of sex education. Responding to the research findings which present schools as places where girls are subject to forms of sexual harassment and subordination, Morrell (2000) has argued for more single-sex schools to provide safe and supportive environments for girls. In contrast, Pattman (2005) has suggested that a key aim of sex education should be to encourage boys and girls to identify less in opposition to each other and to promote possibilities of cross-gender friendships, and that this is only feasible when boys and girls are given opportunities to work together and learn from each other, (even if single-sex group work may need to be used in sex education, in conjunction with mixed groups, as a way of enabling girls, initially, to talk openly about issues relating to sexuality and gender). However single-sex schools may be particularly important for empowering girls, Unterhalter and others (2004) argue in regions, such as Northern Kenya, where gender-segregated relations are sanctioned on religious grounds and girls tend to be withdrawn from (mixed) schools as they reach puberty.

Conclusion

The specific needs of boys and girls and their vulnerabilities in sub-Saharan Africa have not received adequate attention in educational research and policy. Too many gender analyses in education focus on the percentage of males and females in primary and secondary schooling. Girls are often seen to be victims without much voice whereas boys are constructed as sexual predators and as violent. While we have made a strong case for showing how violence and HIV/AIDS links to boys' and girls' vulnerabilities in schools, the use of demonizing terms to construct boys as violent and aggressive is unhelpful particularly as these homogenizing categories fail to consider the plurality of boys' experiences. Similarly most reports on HIV/AIDS show how girls are made vulnerable by the sexual behaviour of boys. In this chapter, we have argued that many of the negative behaviour patterns exhibited by boys are often part of public display of male identity defined within rigid social constructs of what it means to be a boy and man in sub-Saharan Africa.

However, in sub-Saharan Africa there is evidence of changing gender norms especially as a result of women and girls' greater access to labour markets which is eroding men's sense of entitlement to economic advantage. At the same time there is recognition of the importance of men and women working together and the positive impact of education on income and on the health of the family. In South Africa, for example, the constitution

and the calamitous effects of HIV/AIDS, are changing how some men see themselves in relation to women, whilst others continue to hold on to traditional views.

Working with boys and girls to change the normative constructions of gender is critical and HIV/AIDS education as we have shown provides a fertile ground for this to happen. However, change is slow and in the sub-Saharan context, material impoverishment and the vulnerabilities created for boys and girls as a result impact heavily on what change is possible. We have, in this chapter argued nevertheless, that the challenge for education in the light of violence and the massive work needed to stop the spread of the disease, is to tap into the voices of boys and girls and for boys and girls to set the agenda in locating the pathways of change.

REINVENTING EDUCATIONAL SPACES, BUILDING ACTIVE CITIZENSHIP: TWO BRAZILIAN EXPERIENCES

Tristan McCowan and Luís Armando Gandin

Introduction

When Leslie Bethell (2000) states that, “Brazil is a democracy of voters, not yet a democracy of citizens”, he is highlighting two significant aspects of the country. Firstly, the fact that all people can vote in Brazil, and nearly all do (it is obligatory for those aged 18–70), is indicative of a range of advances in the twentieth-century that ensured universal formal rights. The Constitution of 1988 and the Statute of the Child and the Adolescent of 1990 form part of an edifice of official guarantees to the people, including that of compulsory education from 7 to 14 years. Yet the progressive and enlightened nature of much Brazilian legislation and institutional structures is matched by the ineffectiveness and incompleteness of their implementation. Civil rights are generally upheld only in proportion to the wealth of the individuals involved, and the poorest have next to no social rights. In the political sphere, there is formal, but not effective, participation.

In general terms, it is possible to see citizenship as consisting of two strands: the passive, relating to the set of rights that the State guarantees to uphold for the individual, and the active, relating to the participation of the individual in the functioning of the State. The two major paradigms of citizenship – liberal and civic republican – each focus principally on one of these two elements, the former on rights and the latter on active participation (Heater, 1999; Kymlicka, 2002). Yet it can be argued that citizenship will only be effective if attention is paid to both, with citizens ensured of their civil, political and social rights (in T. H. Marshall’s [1950] conception) and taking an active part in decision-making, whether at the local or national level.

Education is related to both these strands of citizenship. Firstly, it is itself a right (though the nature and extent of that right may be strongly contested) and as such, citizenship makes necessary the provision of at least basic education for all. Yet education is also a means to ensuring the second strand. Effective participation cannot be ‘granted’ to citizens (even though the State can make efforts to remove formal barriers). It depends on knowledge, skills and dispositions that must be developed internally and thus will occur largely through formal or informal education. Importantly, therefore, effective citizenship raises questions over the quantity and quality of schooling, the access to educational provision and its nature or orientation.

In addition, we can distinguish between weak and strong forms of political participation (McCowan, 2006a). Current democratic systems for the most part allow citizens freedom of choice among candidates and policies. Yet these political options are embedded in a deeper framework of social, economic and political structures and relations which are fundamental to the running of the polity but which are rarely questioned. Strong forms of citizenship (truly critical forms) will allow these underlying orientations of society, the questioning of which is often taboo, to be open for rethinking and reinvention.

The above analysis, however, shows a certain universalist tendency, one which Unterhalter (1999, pp. 102–103) calls, “an appeal to an abstract concept of the citizen, stripped of all qualities save subjective rationality and morality”, and which can “maintain and perpetuate social divisions based on gender, race ethnicity, sexuality and disability”. Discussion of citizenship must balance the need for universal rights and participation with the claims of particular groups for recognition of difference. Formal equality may mask inequalities and discrimination in practice. People with disabilities, for example, may have specific requirements to enable them to participate on an equal footing in the political sphere. Policies may be needed to address histories of discrimination on the basis of gender and race. This provision may not be easy to achieve: identity has an uneasy relationship with citizenship, since the latter unavoidably entails some abstraction from specific characteristics towards the general characteristics of membership of a polity.

The history of Brazil has not provided fertile ground for the flowering of citizenship. Each of its periods – successively characterized by colonization, authoritarianism and neo-liberalism – has limited both the aspects of extending rights and equipping people for active participation. After independence in 1821, it was well over half a century before slavery was abolished in 1888. Since then, there have been two periods of dictatorship, from 1937–1945 and 1964–1985, and stuttering advances towards democracy in between. Despite significant democratization since 1985, social inequalities remain acute. Brazil in 2006 was ranked 10th most unequal country on the Gini scale, with the top 10% of society having a 58 times greater share of wealth than the bottom 10% (UNDP, 2006).

This historical background is important in understanding the current educational context in Brazil. The country’s unique scenario is a product of long-lasting battles between progressives and traditionalists on the one hand and between the elites and working classes on the other. In the colonial period, opportunities were few and far between, even for the wealthy, who as a general rule sent their children to be educated in Europe. After a slow expansion of provision in the nineteenth century, a new momentum came with the formation of the Republic, as faith grew in the importance of universal schooling and the role of formal education in promoting technological advances (Havighurst & Moreira, 1965). Yet it was only with the rapid economic growth of the years after the Second World War that significant quantitative gains were made, and these continued until near universal primary enrolment was achieved by the end of the century (secondary and higher education gross enrolments are less impressive, standing at 75% and 20% respectively – UNESCO, 2004; INEP, 2003¹).

However, while these quantitative gains are welcome, they hide deep and widespread problems of quality. Curriculum in Brazil has traditionally been characterized by an allegiance to inert academic learning with little relevance to the local context. The *Escola Nova* (new school) movement in the first half of the twentieth century, led by Anísio Teixeira, consequently attempted to inject new life into schools, promoting expression, investigation and problem-solving relating to current issues. These reforms, however, did not affect the majority of educational provision (Louro, 1986). Moreover, in addition to these ‘soft’ elements, the movement had a ‘hard’ side of pragmatic instrumentalism, paving the way for the later technicist approaches of the military dictatorship. Ironically, it was during the two periods of the twentieth century in which direct elections were suspended – first the Vargas period from 1937 and later after the military coup of 1964 – that citizenship became an explicit part of the curriculum. Yet this was a form of citizenship education that fostered neither rights nor critical participation. *Educação Moral e Cívica* (Moral and Civic Education) became a compulsory subject, promoting a conservative patriotism, one which valued duties over rights and the glory of the nation over justice for all its members.

After 1985, direct elections returned and the country experienced a considerable opening of democratic spaces and emergence of social movements. This period coincides with the worldwide rise of an economic policy framework commonly termed ‘neo-liberalism’, which, while to a lesser extent than in other Latin American countries such as Chile, brought significant changes in Brazilian society. During the administration of Fernando Henrique Cardoso (1994–2002) public spending in education was focused increasingly on the primary level, in accordance with the recommendations of the World Bank and other international agencies, with private providers increasing their share at post-compulsory levels. This succeeded in bringing high levels of commercialization in higher education, and despite steady gains in primary enrolments, did not resolve problems of quality, with severe lack of resources and high levels of unqualified teachers in the poorer regions of the country (Gentili, 1995; Gentili & Frigotto, 2000).

A new paradigm of citizenship emerges in this final period. The political sphere appears to be subordinated to the economic, with the free market becoming the model system of public services. The citizen is thereby identified with the consumer, making choices among a number of competing services, but limited, of course, by purchasing power. While the citizen of the authoritarian regime was disempowered by repression and a lack of political rights, the consumer-citizen is disempowered in more subtle ways. Having been granted the semblance of power through choice (the ‘parent power’ of UK government discourse) the consumer-citizen surrenders the potential power of collective organization, democratic deliberation and peaceful protest.

Effective citizenship in Brazil today is threatened by both the paradigms of authoritarianism and neo-liberalism. This chapter explores two educational initiatives, which, in different ways, aim to challenge these frameworks and form new conceptions of citizenship in their place. The first is the Movement of Landless Rural Workers (MST²), a social movement that has campaigned for agrarian reform since its founding in 1984, and which has established a nationwide network of schools in its cooperative settlements. The second is the Citizen School, an initiative implemented by the

municipal government of Porto Alegre, aiming to combat educational exclusion. These are distinct in significant ways: the MST is a social movement and one working in rural areas, while the Citizen School is an urban government-led programme. Yet they share the feature of belonging to a broad popular movement of social and educational reform that emerged towards the end of the military dictatorship. In the process of re-democratization, the establishment of the Constitution and the National Educational Plan, sections of Brazilian civil society experienced high levels of mobilization and created a number of spaces for participatory democracy (Gentili & McCowan, 2003). Numerous trade unions and social movements were formed to represent the interests of particular groups which had been marginalized in previous decades. Forums such as the CONEDs (National Congresses of Education) and the World Social and Education Forums in Porto Alegre created national and international focal points for campaigns. Local governments around the country developed new forms of participatory policy (e.g., Gandin & Apple, 2002; McCowan, 2006b): in this the Workers' Party (PT) has been particularly influential, its achievements at the local level being in many ways more noteworthy than those at the national level. Underlying many of these new initiatives in the educational sphere is the thought of Paulo Freire (1972, 1985, 1994), whose vision of transformatory pedagogy has built faith in the possibility of change in adverse contexts. Freire himself participated actively in this transformation as Secretary of Education of the municipality of São Paulo from 1989 to 1991.

The following sections will explore the two initiatives in turn, and assess their possibilities and limitations in challenging authoritarian and market-based conceptions of citizenship, and for building new forms in their place, ones which can ensure both the guarantee of rights and active participation. The final section will discuss some broader questions arising from the analysis concerning the relationship between education and democratic citizenship in the context of the extreme political marginalization characteristic of many countries of the global South.

Education in the Movement of Landless Rural Workers (MST)

The MST is widely recognized as the largest and most influential social movement in Latin America. It grew out of the actions of scattered peasant uprisings and progressive wings of the Catholic Church responding to the urgent need for agrarian reform. In Brazil, approximately 1% of landowners control 50% of farmland, while there are as many as 4.5 million landless peasants (Brandford & Rocha, 2002; Caldart, 2000). Many of those forced off the land have migrated towards a new form of poverty in the growing urban *favelas*. The movement was officially founded in 1984 and functioned initially in the south of the country, although now it has spread to 23 of Brazil's 27³ states.

Central to the movement's activities is land occupation, whereby a group of families squats on unused agricultural land in one of the large estates. An *acampamento* (camp) is formed, in which high levels of organization and cooperation are required to sustain the itinerant community. The Brazilian Constitution states that idle farmland must be allocated for land reform, and after long struggles with the government, the

families will often win the right to stay. The acampamento then becomes an *assentamento* (settlement) and the families can begin to farm the land, which they do either individually or collectively.

The aims of the MST, however, go beyond the winning of land for those without it. The movement is strongly committed to the transformation of society as a whole, replacing the unjust capitalist system with one in which all people can live and work in dignity, solidarity and equality (MST, 1995, 2001a). With time, the focus has moved from the local to the national level, and even to global issues such as world trade agreements and genetically modified organisms (Caldart, 2000). Soon after the first settlements were established it became clear that some form of educational provision would be necessary for the children of the landless. Furthermore, a large proportion of the adults were themselves illiterate and needed to develop basic skills to improve their agricultural work and enable effective political participation. Networks of primary schools slowly grew, along with adult literacy classes, staffed mainly by those few members of the community who had completed school. After struggles with local authorities, communities managed to have their schools officially recognized, and thereby gain state funding and provision of teachers and materials. Education soon became a key priority for the movement, and a network has been built up of 1,500 schools which over the years have provided for 160,000 children, and 28,000 in youth and adult education, as well as provision in infant education, technical secondary courses, teacher education and other HE courses in partnership with established universities (MST, 2005). Children with a similar socio-economic background in other contexts could expect no more than a few years of poor quality primary education.

These quantitative gains are an achievement in themselves. Yet the aim of the MST is to transform the fundamental nature of education as well:

Faced with the tradition of an elitist, authoritarian, bureaucratic, content-heavy, ‘banking’⁴ school, with a narrow and pragmatist conception of education, [we have] the challenge of constructing a popular, democratic, flexible, dialogical school, a space for a holistic human development in movement. (MST, 2004)

Firstly, for the MST there is a need to make schooling relevant to the rural population. This involves developing knowledge and skills relating to agricultural work, but also building pride in rural culture in the context of the predominantly urban values promoted by the media. An example of new approaches to knowledge is the ethnomathematics described by Knijnik (1996, 1998), in which local calculation methods – such as those of land area and the weight of agricultural produce – are integrated into the curriculum. The movement is also strongly influenced by the ideas of Paulo Freire, and attempts to maintain pedagogical relations based on *dialogue*, in which both students and teachers are engaged in a common process of learning and human development. Processes of Freirean dialogue are also means to the construction of democracy, since they embody respect for persons, the valuing of the knowledge and opinions of all and the provision of a site for expression. There is also an explicitly political element in MST education. The movement follows Freire (1972, 1994) in understanding that education cannot be neutral, and so as not to support the unjust status quo must actively promote justice and

oppose oppression. While adult education allows for more developed forms of political discussion, the movement aims to promote a sense of justice and understanding of societal dynamics from the earliest phases of schooling. Another essential element is that education in the MST is organically linked to the social movement. Education, both formal and informal, is integral to achieving the goals of the individual communities and the movement as a whole. Beyond this, the movement itself can be seen as a school, and participation in the struggle for social justice the most important learning experience the landless people engage in.

This final idea is best expressed by Roseli Caldart (2000, 1999), perhaps the most influential education theorist in the movement. In her work she explores the rich dialectic of the school in the movement and the movement as a school. One of her key motifs is *pedagogy in movement* in which she sees the educational work of the MST as one that is constantly being created and recreated by the practical experience of educators in *acampamentos* and *assentamentos*, in dialogue with theoretical influences. Another is the importance of the *sem terra* (landless) identity, which, following Thompson's (1980) analysis of the English working class, she sees as fundamental to the development of the social movement as a political actor.

Another distinctive aspect of MST education is the 'mística', referring to those activities designed to develop allegiance to the movement and its principles (MST, 1999). Rituals enacting episodes in the movement's history, anthem singing and use of the symbolic flag, among other activities, are encouraged to develop the emotional aspects of participating in the struggle for land reform. Tied to this is the importance given to history, in terms of world history in general in order to understand the root causes of social inequalities and specifically the history of the movement.

In relation to the understanding of citizenship sketched above, therefore, the movement acts both to ensure the right of citizens to an education of quality, and also to empower citizens to participate fully in the political sphere. It is perhaps in this latter function that the movement is most distinctive, with political elements strongly integrated into the school curriculum, and with a wider context (the activities of the movement itself) in which these skills can be exercised. In relation to the weak and strong forms identified above, political participation is understood to involve challenging the core structures of society rather than simply exercising electoral choice within a given system. Citizenship is seen to depend on *conscientization*, the development of political consciousness together with action. One of the stated aims of education the movement is:

[t]o awaken the organizational consciousness and spirit of leadership of the children, adolescents, educators and community, with political clarity in order to exercise citizenship. (MST, 2001b)

Students develop this political consciousness and capacity for action through the participatory structures of the school itself. Pupils' collectives and self-organizing work groups serve to give students an opportunity to develop deliberation and organizational skills, and have a real voice in the running of the school:

We understand by *self-organization* the right of pupils to organise themselves into collectives, with their own space and time, to analyse and discuss their own issues, to elaborate proposals and make their own decisions with a view to participating as subjects in the democratic management of the educative process, and of the school as a whole. (MST, 1999)

Elsewhere it is stated:

When people are given everything, dependence is reinforced and the person never becomes a subject. It is part of the process that people wanting to become literate organise themselves to achieve this objective. (MST, 1994)

This self-organization is particularly evident in the movement's teacher education provision, where the students are effectively required to construct and run their own courses (Caldart, 1997). The first formal courses were run in 1990, and in 1998 a higher education programme in teacher education was established, using a distinctive approach termed *pedagogy of the land*, responding to the specific political and environmental needs of the movement.

In schools, participatory structures are also present for teachers, who, like the students, are themselves engaged in a process of collective transformation. Some schools, therefore, have horizontal management structures with the responsibilities of head teacher rotating among the members of staff. Participatory bodies also extend to the members of the community, who are involved in *general assemblies*, to determine the overall directions of the school, and are represented in the *school council* (or *education team*), where the details of the implementation are discussed. These structures serve to facilitate the running of the school, to integrate it more effectively in the life of the community and to provide a space for all community members, including the children, to develop skills of political participation (McCowan, 2003).

Assessments of the achievements of the MST's educational programmes vary. The sociologist José de Souza Martins has identified what he sees to be a fatal contradiction in the MST between the belief systems of the vanguard, mostly with a revolutionary Marxist vision, and the body of the landless people, rooted in traditional conservative and religious values (Martins, 2000). While this distinction may be an oversimplification, there certainly exist significant tensions between progressive and traditional values in the movement. One area in which this is apparent is gender. On the one hand, the movement has taken considerable strides to give women equal footing in decision-making. One of the movement's six principal goals is "to combat all forms of social discrimination and seek the equal participation of women". The National Sector of Gender has consequently been established to help achieve this aim within the movement. One structural manifestation of this goal is the requirement that one of the two delegates representing each community (and each state) must be a woman. By the year 2000, 9 of the 18 elected members of the national leadership were women, a considerable achievement in a country where less than 10% of the representatives in the Lower House and the Senate are female.

Nevertheless, the traditional machista attitudes and practices of the wider society can still be seen within the movement, and women can struggle to be accepted in roles

other than those of the home and child rearing. Education is seen by most as key to changing these deep-seated attitudes:

Why should men's work be valued more? There's a great difference in the job market.... So we work with these issues in the camp, women and men being valued equally for going out to the fields. So in this way we break what the media has been giving us since the time of our ancestors. (Interview with Olga, educational coordinator)⁵

The MST as yet has not paid great attention to other factors of wider social division such as race, disability and sexuality. While adopting a generally inclusive approach, it has yet to develop an effective strategy to ensure this in practice. As a whole, the movement tends towards universalist conceptions of citizenship, focusing on the 'human' as the fundamental underlying value (although it does recognize the specificities of the rural context). The struggle for land reform is seen as part of the wider class struggle, to which other forms of oppression, such as race and gender, are subordinated (MST, 2001a).

The MST's efforts in promoting effective citizenship are not, therefore, without problems. Another issue concerns the development of criticality, primarily conceived in terms of Freire's conception of conscientization. Previous research (McCowan, 2003) has shown that while the movement is successful in developing critical understanding and attitudes towards the government and State structures, it is less successful at doing so towards the movement itself. Given the extreme external threats facing the MST (particularly from landowners and their militias) and the need for internal unity for effective coordination, it is no surprise that critical attitudes can become a secondary priority. Some commentators (e.g., Navarro, 2001) have argued that uncritical political education is not uncommon in the movement, particularly in relation to young activists moving into positions of responsibility. At the school level, this is less common, though use of the *mística* may be problematic in this respect. The right-wing press (e.g., Weinberg, 2004), however, aiming to undermine the MST as a whole, has undoubtedly exaggerated the extent of 'brainwashing' in the movement. Moreover, as stated before, the MST adopts a Freirean approach to neutrality, and would consider any more 'balanced' approach to political education to be supportive of the status quo.

Another issue concerns the running of its state-funded (mostly primary) schools. For the movement, this is problematic since the local authorities can impose teachers unfavourable to its aims and thereby undermine the distinctive philosophy of the school. Yet the MST resists running its schools privately, partly because it lacks the funds to do so and also because it is strongly in favour of the idea of public schooling. From the point of view of the State, MST schools are problematic as they have a specific ideology which may not be sufficiently 'lay' to justify state school status. Nevertheless, state and municipal governments recognize that the MST is playing a fundamental role in providing basic schooling in many rural areas, and thus tolerate it.

These contradictions and tensions are real and cannot be explained away. Yet they do not negate the remarkable achievements of the MST in going beyond critiques of conventional schooling to create a viable alternative, and moreover maintain this

at a number of levels across a nation as large as Brazil. The MST's approach is well summed up in the following passage:

With time these children gain a greater consciousness of the struggle: this happens ... where they have the right to speak, to sing. They have a strong desire to participate, they have pleasure in contributing to the assemblies, meetings, celebrations, building toys and the school tent.... It is this space for participation that makes the children critical, so they don't accept things as they are. (MST, 2001b)

The MST experience is undoubtedly highly specific to the Brazilian context. Yet can it speak to other contexts of political marginalization in the global South? Before addressing this question we will turn to the second case of innovation in relation to education for citizenship: the Citizen School initiative.

The Citizen School in Porto Alegre

The Citizen School⁶ is an educational initiative of the municipal government of Porto Alegre, the largest city in southern Brazil, with a population of approximately 1,400,000. In 1989, a coalition of left-wing parties (the Popular Administration), under the leadership of the PT, won the municipal elections and started a new plan for the city. The basic premise was a radical idea of democracy, one that entailed a real involvement of the citizens in the governance of the city. According to one of the former mayors of Porto Alegre, the purpose of the Popular Administration is to:

recuperate the utopian energies, (...) [to] create a movement which contains, as a real social process, the origins of a new way of life, constructing a 'new moral life' (Gramsci) and a new articulation between state and society (...) that could lead social activity and citizenship consciousness to a new order. (Genro, 1999)

In order to materialize such a complex ideal, the Popular Administration envisioned several macro mechanisms that would allow the implementation of the articulation described by Genro. One of these elements is the Citizen School.

The Citizen School is the project of involving all the municipal schools of Porto Alegre in a radical idea of education for citizenship. Fighting against the idea of an individualized citizen, the Citizen School claims that the whole educational institution has to embody citizenship. The main goals of the Citizen School can be summarized in a quotation from the one of the Secretaries of Education. He says that the project wanted to create a school:

where everyone has guaranteed access, that is not limited to transmission of content; a school that is able to articulate the popular knowledge with the scientific knowledge. A school that is a public space for the construction and experience of citizenship, that goes beyond merely delivering knowledge and transforms itself into a social-cultural space, with a pedagogical policy oriented toward

social transformation, where the student is the subject of the knowledge and where the pedagogy takes place in an interdisciplinary perspective, overcoming the curricular fragmentation present in schools. A school that has the necessary material resources to implement this policy, where the participation of the whole community can lead to the construction of an autonomous school, with a real democratic management, where all segments of the community have their participation guaranteed. (Azevedo, 1999b)

From these guidelines, the basic goals of the project were created in the 'Constituent Assembly'. This was a democratic, deliberative and participatory forum created in order to mobilize the school communities and generate the principles that would guide the policy for the municipal schools in Porto Alegre. The process of organization of the Constituent lasted 18 months and involved thematic meetings in the schools, regional meetings, the Assembly itself, and the elaboration of the schools' internal regulation.

The process of deciding the principles through such structure is itself worth noting. The Citizen School project was created under the principle of not separating the determination of the goals from the creation of the mechanisms to implement these goals. Rather, the process of generating the practical goals should represent in itself an innovative mechanism that is able to produce transformations in the relationships between the schools and the community. The normative goals that guide the practice in the schools are collectively created, through a participatory process. The idea was to foster a government that creates channels for real development of collectively constructed normative goals and that replaces the traditional relationship of distant government officials managing schools that they know little about.

The Constituent Assembly elected the radical democratization of education in the municipal schools as the main normative goal of the Citizen School project. It was decided that this radical democratization would have to occur in three dimensions: democratization of access to school, democratization of knowledge and democratization of governance. These three principles were to guide every action in the municipal system of Porto Alegre. These three principles changed the structure of the schools and the relationship between schools and the Municipal Department of Education (SMED).

In order to democratize the access to the school and to the knowledge, the SMED implemented a new organization for the municipal schools. Instead of keeping the traditional structure of grades with the duration of one year (1–8 in primary education), the idea was to adopt a new structure called *cycles*. The administrators at the SMED were convinced that the issue of access to schools could be dealt with in a much better way using cycles. According to the SMED,

the cycle structure offers a better way of dealing seriously with student failure, because its educational perspective respects, understands, and investigates the socio-cognitive processes that the students go through. (SMED, 1999a).

The idea is that by using a different conception of learning/time, the Citizen School would put an end to the punishment of the so-called 'slow' students. In this new configuration, the traditional deadline – the end of each academic year – when the

students had to 'prove' that they had 'learned' was eliminated in favour of a different time organization. The democratization of knowledge was to be addressed by the adoption of cycles: "[T]he cycles contribute to the respect of the rhythm, the timing, and the experiences of each student, enhancing the collective organization and interdisciplinarity in the schools" (SMED, 1999a). The establishment of cycles was a conscious attempt to eliminate the mechanisms in schools believed to perpetuate exclusion, failure, and dropouts, as well as the blaming of the victim that generally accompanies these.

In the Citizen School, there are three cycles of 3 years each, a change that adds one year at the start of primary education (expanding it to 9 years). This makes the municipal schools responsible for the education of children from 6 to 14 years of age. The three cycles are based on the cycles of life: each one corresponds to one phase of development, that is, childhood, pre-adolescence and adolescence. The idea is to group together students of the same age in each of the years of the three cycles. This aims at changing the reality (one that is present in the majority of public schools that serve the working class in Brazil) that confronted the SMED when the Popular Administration started to govern the city: students with multiple failures were in classes intended for much younger children. Through organizing the education by age, having students of the same age in the same year of the cycle, the SMED aimed to re-motivate children who had failed multiple times. Its goal was to challenge the common sense idea that learning must be sequenced. As the Secretary says, the institution using the cycles is:

the redesigned school, with space and time that are geared towards the development of the students. Children and adolescents are beings in permanent development that should not be ruled by the school calendar or the school year. (...) The school using the cycles sees learning as a process in which preparatory periods or steps do not exist; instead there is a permanent process of development. Instead of punishing the student because he/she did not learn, the Citizen School aims at valorizing the already acquired knowledge. (Azevedo, 2000)

In schools using these cycles, students progress from one year to another within one cycle, and the notion of 'failure' is eliminated.

Despite this victory, the SMED understood that the elimination of exclusion mechanisms was not enough to achieve the goal of democratization of knowledge. Because of this, the Citizen School created several mechanisms that aimed at guaranteeing the inclusion of students: Progression Groups for students who had discrepancies between their age and what they have learned, Learning Laboratories for students who, despite the changes in methodology and curriculum were still not learning, Itinerant Teachers to aid teachers by being a second educator in the classroom, when one is needed, and Formative Evaluation to help students understand their own pace of learning without merely classifying them through grades.

Curriculum transformation has been a crucial part of Porto Alegre's project to build 'thick democracy' and effective citizenship. This is actually what can make the democratization of knowledge possible. It is important to say that this dimension is not limited to access to traditional knowledge. What is being constructed is a new

epistemological understanding about what counts as knowledge as well. It is not based on a mere incorporation of new knowledge within the margins of an intact ‘core of humankind’s wisdom’, but a radical transformation. The Citizen School goes beyond the mere episodic mentioning of cultural manifestations or class, racial, sexual and gender-based oppression. It includes these themes as an essential part of the process of construction of knowledge.

In the Citizen School, the notion of ‘core’ and ‘periphery’ in knowledge is made problematic. The starting point for the construction of curricular knowledge is the culture(s) of the communities themselves, not only in terms of content, but in terms of perspective as well. The whole educational process is aimed at inverting previous priorities and instead serving the historically oppressed and excluded groups. The starting point for this new process of knowledge construction is the idea of the Thematic Complex. This organization of the curriculum is a way of having the whole school working on a central generative theme, from which the disciplines and areas of knowledge, in an interdisciplinary effort, will structure the focus of their content.

In the Citizen School, the idea of the Thematic Complex emphasizes that the disciplines or areas of knowledge are not all collapsed in all the levels of the curriculum; what happens is that all knowledge areas become subordinate to a global idea, to a thematic core that is rather complex because it represents the centre of the preoccupations and/or interests of the community where the school is situated. All the areas or, in fact, the entire school, are guided by the discussion and problematization around the thematic complex. This thematic complex provides the whole school with a central focus that guides the curriculum of that school for a period of time that can be one semester or an entire academic year.

After having determined the principles, the larger contribution of each knowledge area for the discussion of the thematic complex, and the conceptual matrix – a web of concepts from the knowledge area, rather than isolated facts or information that the teachers understand are essential to use when dealing with the thematic complex – the teachers have meetings organized by their knowledge areas and by each year in the cycles, to elaborate and plan the curriculum.

Each school is autonomous and able to elaborate its own curriculum. This curriculum has to meet the following criteria: no student should have to ‘unlearn’ his/her knowledge, culture and practices in order to learn ‘scientific’ knowledge and no student should leave school without being exposed to formal ‘school knowledge’. The idea is that no knowledge should be left unquestioned and considered above critique. The idea of starting with their own experiences should not mean that students have to stop there.

To give a concrete example of how this works, here is the description of how the socio-historic knowledge area proceeded, in one school of Porto Alegre, to organize its curriculum. After the phase of carrying out research in the community, the school elected “the quality of life in the favela” as its thematic complex. The socio-historic knowledge area had to construct the principle of that area, that is, the contribution of this area to deal with the elected thematic complex. This area expressed its possible contribution as “the individual and collective transformation of the citizen, in his/her time and space, recuperating his/her origins, aiming at improving the quality of life, taking into account the ideas of the community where this individual is situated”.

From the major thematic complex – the quality of life – three sub-themes were listed by the teachers in the socio-historic area: rural exodus, social organization and property. In the rural exodus sub-theme, the issues reflected the origin of the community – living now in a favela, but originally from the rural areas. In this sub-theme, the issues discussed were migration movements, overpopulation of the cities, “disqualification” of the working force, and marginalization. In the sub-theme social organization, the issues were distributed in terms of temporal, political, spatial and sociocultural relations. The issues, again, represent important questions in the organization of the community: the excessive and uncritical pragmatism of some in the neighbourhood associations, and cultural issues such as religiosity, body expression, African origins, dance groups and samba schools. In the third sub-theme – property – the issues were directly linked to the situation of the families in the favela, living in illegal lots with no title, having to cope with the lack of running water, basic sanitation and other infrastructure problems, the history of this situation and of the struggles for lots legalization, and their rights (of having basic public goods in the neighbourhood) and duties (of understanding the importance and the social function of taxation) as citizens.

The governance structure of the citizen school was also radically changed. The School Councils, established by a municipal law in December of 1992 and implemented in 1993, became the most important institutions in schools. They were formed by elected teachers, school staff, parents, students, and by one member of the administration, and they had consultative, deliberative and monitoring functions. As such they expressed key ideas of the Popular Administration and the demands of social movements involved in education in the city.

It is important to mention that, before the Popular Administration took office, there was a practice (common in Brazil) of a very centralized budget. Every expense (even the daily ones) had to be sent to the central administration before it was approved, and then, either the money was sent to the school, or a central agency would purchase the product or the service necessary. In such a system, the school council would have “their hands tied”, with no autonomy at all. The SMED changed this structure and established a new policy to make the amount of money available to each school every 3 months. According to the SMED, this measure instituted the financial autonomy for the schools, and allowed the schools to manage their expenditures according to the goals and priorities established by the school council. At the same time that this measure creates autonomy, it gives parents, students, teachers and staff who are present in the council a notion of social responsibility in administering public money, and it teaches them to prioritize the investments with solidarity in mind (SMED, 1999b).

In the municipal schools of Porto Alegre, the whole school community elects the principal by direct vote. The one responsible for the implementation of the decisions of the school council, that is, the principal, is herself/himself elected defending a particular project of administration for the school. There is a legitimacy that comes from this. The principal is not someone who necessarily represents the interests of the central administration inside the school councils, but someone with a majority of supporters inside that particular educational community. Principals thus have a great degree of embeddedness, and, because of this, the SMED feels that it is possible to avoid the potential problem of having someone responsible for the concretization of the

deliberations occurring in the school councils who is not connected with the project. But the responsibility of the community does not stop there: through the school council, the school community has a way of monitoring the activities of the principal and holding her/him responsible for implementing its democratic decisions.

These new mechanisms created to implement the democratization of access, knowledge and governance would not meet this goal without large investments in school buildings and in teachers' conditions of work. The municipal schools are almost all situated in the most impoverished areas of the city and unlike other public schools in these conditions, are in very good shape. Many of these buildings were constructed recently, have excellent layouts and are very well kept. This sends a clear message: a school in a poor neighbourhood has to make the education that is supposed to happen in its interior possible and the school staff should not have to worry about building conditions. The other aspect is teachers' salaries and training: in Porto Alegre a municipal school teacher earns three times as much as a state school teacher. There is also a policy of continuous in-service education both in the knowledge area of the teachers and in general educational issues, like the relationship of education and society, for example.

Despite all these successes, there are real challenging issues in the implementation of the Citizen School. Although the SMED is sensitive to issues of race and gender, this does not seem always to translate into a sustained support for the schools as they face the challenge of constructing a curriculum that deals with racism and gender discrimination. Certainly because of its Marxist roots, the emphasis of the SMED has been on issues of class. These are clearly central issues for students who live in slums, but reducing all oppression to class can certainly represent a problem in a country like Brazil, with such blatant racial and gender issues.

Another potential problem is the fact that teachers' knowledge is not always considered and sometimes even shunned in the Citizen School. If it is true that school curriculum revolves around the knowledge of the communities, the same cannot be said about the previous experiences and practices of teachers. Many times, the SMED sees teachers as the ones responsible for the problems it faces. A simplified description of this problem is the following: "the proposal is good, but conservative teachers do not implement it as it should be". The idea of characterizing every teacher that criticizes elements of the proposal as conservative shows how problematic the implementation of the proposal can be in some instances: teachers are the ones who make a proposal real in a school. As several studies have shown, teachers' knowledge must always be taken into consideration when the goal is to enact progressive reforms (see Page, 2001; Gitlin, 2001).

Finally it is essential to discuss the sustainability of the initiative. When the city of Porto Alegre faced budget constraints, cuts were made in key elements of the project, such as the itinerant teacher and places in the Learning Laboratories. But the biggest challenge is certainly the fact that, after 16 years in power, the PT and the Popular Administration lost the municipal election in 2004. The core mechanisms of the Citizen School have not been touched so far and continue in place, even though the name given to the educational experience of the city is a different one. But it might be too early to say. It will be important to follow the subtle changes that can occur and possibly undermine the project.

The Citizen School is an alternative to neo-liberal solutions in education, based on the introduction of market schemes inside schools. It has been important not only as a way of giving an impoverished population a quality education that will enable them to have better chances in the paid labour market and at the same time operate as empowered citizens, but also because it has generated structured forms of ‘educating’ the communities both for organizing around and discussing their problems, and for acting on their own behalf through the channels of participation and deliberation. In the process, it has ‘educated’ the state agencies as well.

Conclusions

Some common themes emerge from these two cases. Both represent attempts to address both the ‘participation’ and ‘rights’ strands of citizenship. On the one hand, the two initiatives aim to provide access to education for marginalized populations, both in terms of making places available in schools, and taking steps to ensure inclusion in the learning environment and avoiding early dropout. They are therefore attempting to go beyond the formal right of all Brazilians to basic education and to take action to make it a reality. Yet they are also aiming to equip learners to be effective citizens in the active sense, by involving students, teachers and the community in decision-making and providing the knowledge and skills for them to extend that participation to the wider political sphere. Emerging from the dual influences of authoritarianism and neo-liberalism, the two cases are creating a new understanding of citizenship, one based in participatory democracy and a Freirean conception of conscientization, by which social transformation is brought about through a dialectic of reflection and political action.

However, the cases also show some of the difficulties of implementing this type of programme. As in many other contexts, there is a tendency to see teachers as ‘obstacles’ to change and reform. Neither of these two cases has been fully successful in resolving the dilemma of implementing a normative scheme through teachers, while at the same time respecting their autonomy, their knowledge and their experience. Teacher education is key here (as long as it is not simply an attempt to reconstruct the teachers in the initiative’s mould), but so is the authentic involvement of teachers in the construction of policy. Another limitation evident in the cases concerns efforts to address difference, particularly that of race and of gender. In dealing with social exclusion in a general way, the initiatives have not fully acknowledged the specificities of race and gender, the distinct historical oppressions of women, African Brazilians and indigenous peoples, and the need for explicit responses to them. Lastly, there is a simple problem of sustainability and viability: in the case of the Citizen School, this concerns the survival of the initiative in the face of a change of government, and in the case of the MST, the incorporation of its project in the state sector. The necessarily political nature of the two projects threatens their continued existence.

Brazilian history has certain unique aspects – such as its mixing of peoples, its spectacular concentration of wealth and the combination of centralizing and decentralizing impulses – and the cases explored in this chapter are without doubt responses to the specificities of this context. Yet the successes and challenges of the two in the face of severe social and political exclusion do have implications for other countries. A first

issue concerns the importance of participation. The cases show the benefit gained from involving the whole school and the wider community, not in the implementation of policy created by a distant government, but in the formulation of goals and methods themselves. Secondly, the two initiatives have both grappled with the problems faced by schools all around the world of whether to teach ‘universal’ academic knowledge, and risk marginalizing the students’ own culture, or to teach the local knowledge of the community and risk confining students to their own context without the possibility of looking beyond. Both cases here show that it is possible to combine the two, drawing on local knowledge and skills relevant to the lives of the community, but at the same time equipping students to pursue a life beyond it and to understand and engage with wider forms of knowledge and processes of social change.

A further implication of these cases is the importance of maintaining a holistic vision of citizenship. Conceptions based purely on the guarantee of rights of the individual are not sufficient, and yet these rights must be guaranteed before active forms of participation can be fostered. In addition, education must address citizenship as identity – acknowledging differences that may challenge the “abstract concept of the citizen, stripped of all qualities save subjective rationality and morality” (Unterhalter, 1999) – as well as citizenship as equality in the polity. Lastly, in a spirit captured by the World Social Forum slogan “another world is possible”, these cases show that, even within the established state system, it is possible to create alternatives in education. Steering a course through both traditional hierarchical forms of schooling and contemporary consumerist ones, radical democratic alternatives are a possibility, albeit one facing considerable challenges.

In the midst of an overwhelming global wave of reforms where market control, devolution with fewer resources, tight control of outcomes, steering at a distance, and accountability that only looks at quantitative results are the central impulses, it is important to reaffirm, that to encounter experiences like the Movement of Landless Rural Workers or the Citizen School is certainly a novelty. What is even more striking in these projects is the fact that, unlike other progressive initiatives around the world, where individual teachers or schools promote radical changes, this is an organic transformation of a whole school system, in the Citizen School case, or the conception of education in the case of the Landless Movement.

The change in structures has energized schools and produced spaces where education for social justice is being pursued. If it is true that there are serious limits to what has been done so far, it is also true that real spaces have been created to challenge these same limitations.

Notes

1. Figures for secondary enrolment are from 2002 to 2003, and for tertiary are for 2002.
2. Movimento dos Trabalhadores Rurais Sem Terra.
3. This figure includes the Federal District.
4. Freire’s conception of ‘banking education’.

PERSPECTIVES ON CHILDREN AND VIOLENCE

Jenny Parkes

There can be no compromise in challenging violence against children. Children's uniqueness – their human potential, their initial fragility and vulnerability, their dependence on adults for their growth and development – make an unassailable case for more, not less, investment in prevention and protection from violence. (Pinheiro, 2006)

The UN World Report on Violence against Children draws attention to how, across the globe, young people experience multiple forms of violence in their daily lives: in homes, schools and care institutions, in places of work and in the community (Pinheiro, 2006). Violence for many children is not an exceptional but an everyday event, particularly in countries where there has been recent or ongoing political conflict, often low- and middle-income countries, where the legacy of this is a coalescence of multiple forms of violence (Glanz & Spiegel, 1996; Knox & Monaghan, 2003; Muldoon, 2004; WHO, 2002; WHO, 2002). The focus of this chapter is on the consequences of living with such violence for children's psychological and social well-being. The chapter explores a diverse literature from psychology, sociology, anthropology and education, asking what we can learn from this literature to respond to Pinheiro's challenge to protect children from violence.

There is an extensive literature highlighting the devastating consequences of violence on children's educational, health and social opportunities and outcomes, and Pinheiro makes a strong plea for action to address these consequences. However, while the importance of challenging violence against children cannot be underestimated, taken-for-granted assumptions in the literature need to be interrogated. In particular, universalising understandings of childhood stemming from the West underpin research across the globe, producing particular forms of action and intervention which, it has been claimed, may not always be in the best interests of the child (Boyden, 2003). As evident in Pinheiro's words, childhood is viewed as a natural, universal and distinct phase, characterised by innocence and vulnerability, a perspective which can be traced back to the Romantic and Reform movements in Europe in the nineteenth century (Boyden, 2003; James, Jenks & Prout, 1998; Woodhead, 1999). In much of the literature discussed in this chapter, children, living in high-violence neighbourhoods, are viewed as innocent victims of violence, in need of protection or rescue, or as caught up in cycles of violence, socialised to become the perpetrators of the future. As Western feminist researchers have been criticised for the colonising, homogenising representation

of “a composite, singular ‘third world woman’” (Mohanty, 1991), research on children living with violence in (post-)conflict settings may construct a homogenised ‘third world child’, both victim of and perpetrator of violence. The diversity of childhoods is neglected, and the active ways in which children engage with and act upon their social worlds ignored (Boyden, 2003).

With this critical lens, this chapter considers studies on children’s experiences of living in areas where violence takes many forms, in neighbourhoods, families and schools, often in countries where there has been recent or ongoing political conflict, including South Africa, Palestine and Ireland, as well as drawing on studies in urban neighbourhoods of the USA. The first section considers psychological research, mainly within a positivist tradition of inquiry. The second section explores research associated with sociological and anthropological studies which draw on qualitative and interpretive paradigms. I have structured the chapter this way to reflect the mainstream literature on children and violence and some of its critics, but the distinction is a little misleading, as there are many overlaps and increasingly psychologists are engaging with a social and interpretive approach. In the final section of the chapter I will consider recent research which addresses some critical concepts, and conceptualises children as actively engaging with their social worlds. My intention is not to privilege one form of research, but to attempt to synthesise these diverse bodies of literature in ways which may contribute to the goal of preventing and contesting violence.

Psychological Perspectives on Children and Violence

Much of the literature on children and violence stems from the field of psychology. This literature comes mainly from a positivist tradition, with studies attempting to identify measurable effects of violence on children. These effects include emotional consequences, such as post-traumatic stress disorder and effects on child development and socialisation. Finally, in this section I will consider the growing awareness in psychology of the importance of context, which has generated research into risk and resilience factors.

Emotional Consequences and the Concept of Post-Traumatic Stress

Distress, anxiety and depression are frequent responses to violence, and studies have found that following exposure to violence, young people may try to avoid thoughts and feelings, places or people associated with the trauma; they may become angry and irritable, or experience intense psychological distress at exposure to traumatic reminders (Seedat, Nyamai, Njenga, Vythilingum & Stein, 2004). This constellation of responses has been termed post-traumatic stress disorder (PTSD), and has been identified in studies in many post-conflict settings, including Palestine (Punamaki & Suleiman, 1990; Thabet & Vostanis, 1999), South Africa (Barbarin & Richter, 2001; Dawes & Tredoux, 1990; Seedat, van Nood, Vythilingum, Stein & Kammer, 2000), Cambodia (Hubbard, Realmuto, Northwood & Masten, 1995) and Kuwait following the Gulf War (Nader, Pynoos, Fairbanks, Al-Ajeel, & Al-Asfour, 1993); as well as in neighbourhoods with high rates of community violence in the USA (Jenkins &

Bell, 1997; Martinez & Richters, 1993; Osofsky, Wewes, Hann & Fick, 1993). PTSD symptoms increase with the level of and proximity to violence, and when there is a close relationship with those engaged directly with violence (Jenkins & Bell, 1997; Lorion and Saltzman, 1993; Seedat, van Nood, Vythilingum, Stein & Kaminer, 2000). In some studies, symptoms have varied with age and gender, so girls, for example, have been found more likely to exhibit depressive symptoms or to internalise pain, while boys may be more likely to externalize pain and participate in aggressive acts (Lorion & Saltzman, 1993; Seedat, Nyamai, Njenga, Vythilingum & Stein, 2004). Younger children may exhibit more passive, regressive symptoms, like bed-wetting or delayed language development, while older children may be more likely to engage in acting out self-destructive behaviour (Jenkins & Bell, 1997).

These studies draw attention to the potential consequences of violence for children's mental health across international settings, and highlight the need for therapeutic interventions. However, frequently neglected is the finding that many children do not appear to be measurably distressed by their exposure to violence. In studies in South Africa, for example, approximately 10–20% of children exposed to a range of traumas experienced PTSD, with perhaps another 10–20% exhibiting some symptoms of emotional distress (Cairns & Dawes, 1996; Dawes & Tredoux, 1990; Seedat, Nyamai, Njenga, Vythilingum & Stein, 2004; Seedat, van Nood, Vythilingum, Stein & Kaminer, 2000). The finding that, despite often horrific engagements with violence, many children do not appear to suffer long-term psychological effects, has led to a shift towards the question of how children cope (Cairns, 1996) and even whether there may be positive effects. Case studies of children living in war zones have identified negative consequences, but also for some children the development of precocious moral sensibility (Coles, 1986) and enhanced empathy (Garbarino, Kostelny & Dubrow, 1991). In South Africa, an in-depth clinical study of a group of 60 young people who, over an extended period, were exposed to and engaged with political violence found that when violence could be justified within an existing system of morality, such as ideology during war, it created few psychological problems (Straker, Moosa, Becker & Nkwale, 1992). Such findings point to the importance of context in anticipating possible emotional consequences.

The diagnosis of PTSD is a psychiatric one, stemming from the West, usually employed to assess the need for clinical support following single traumatic events. A number of studies have pointed out that the effects of repeated exposure may be quite different from those following single traumas, and exposure to chronic, daily violence may generate longer-term developmental changes (Jenkins & Bell, 1997; Perry, 1997; Zeanah & Scheeringa, 1997). An alternative label of “continuous traumatic stress syndrome” has been proposed to reflect the political context for many people of repeated, expected traumas (Simpson, 1993). But, while such labels might serve to highlight the problems of people living in violent communities, they simultaneously explain their behaviour within a medical model, suffering ‘symptoms’ of a disease or illness within the individual rather than motivated by the features of the situation. The emphasis on ‘disorder’ pathologises children's reactions, when emotions like fear, anxiety and aggression may in fact be functional for day-to-day coping (Swartz & Levett, 1989). In these analyses, the conceptualisation of children

as dependent and vulnerable is combined with and reinforced by a bio-medical model which positions children as traumatised victims in need of therapeutic care (Boyden, 2003; Machel, 1996). Jo Boyden argues that in Rwanda, Bosnia and Kosovo, this has had the dangerous consequence that aid packages have prioritised psychosocial interventions over meeting young people's basic survival needs (Boyden, 2003). While it is vital to be alert to possible stress reactions to violence, it is also important to recognise that these may be highly localised and variable, and that blanket approaches to intervention following violent events do little to address the ongoing violence of many young people's lives.

Socialisation, Risk and Resilience

Paradoxically, at the same time as the psychological literature assumes childhood innocence and vulnerability, there are allusions to the inevitability of child victims becoming adult perpetrators, through a cycle of violence. Reproductive statements abound in the literature, with comments like "it is a sociological fact that people treated inhumanely can only treat others in the same way" (Malepa, 1990), or "these children live in a 'culture of violence' and their view of the world is shaped by it. This fact is tragic and extremely dangerous" (Oshako, 1999). Not just do such statements pathologise children growing up in violent neighbourhoods, contributing to a version of the 'third world child' discussed above, but the evidence for these assumptions is weak and conflicting.

Studies report that exposure to violence in childhood affects moral development, with young people learning to see violence as a way of solving problems (Reilly, Muldoon & Byrne, 2004). Palestinian children involved in street confrontations with Israeli troops, for example, were found more likely to use violence in schools and families as a socially justified tool for solving problems (Abuateya, 2000). Clinical observations have identified normalizing the violence, becoming desensitised, and dehumanising the enemy (especially in wartime) as short-term coping strategies, which can also lead to violence then being seen as an appropriate response to many everyday situations (Garbarino, Kostelny & Dubrow, 1991).

However, in a review of the international literature on moral development and political violence, Andrew Dawes concluded that evidence that violence is perpetuated through its effects on children's moral reasoning and problem-solving was weak (Dawes, 1994). While researchers have observed children's play imitating violence in the neighbourhood (Bundy, 1992; Jones, 1993), others have been surprised by the absence of such re-enactments. For example, in her detailed study of children in a South African township in the mid-1980s, Pamela Reynolds noted that there was remarkably little violence in children's play, either real or pretend, despite the violence to which the children were exposed (Reynolds, 1989). Other South African studies have found that, despite frequent exposure to violence, young people did not appear to become habituated (Straker, Mendelsohn, Moosa & Tudin, 1996; Straker, Moosa, Becker & Nkwale, 1992). And while in one South African study, direct exposure to violence was associated with aggression, opposition/defiance and deficits in self-regulation, witnessing violence was not associated with antisocial behaviours, and gender (being male) was

more predictive of antisocial behaviours than direct exposure to violence (van der Merwe & Dawes, 2000).

These complex and contradictory findings challenge universalising assumptions about the reproduction of violence, and increasingly researchers have turned their attention to identifying the range of factors that increase the risk of violence, or alternatively those that increase young people's resilience. This ecological model, which attempts to understand the multifaceted nature of violence and its consequences, has been increasingly influential in research and policy development (WHO 2002; Pinheiro, 2006). It attempts to measure how a combination of factors, relating to personal characteristics, family and the immediate and broader social context combine to influence outcomes for young people in high violence contexts (Cicchetti & Lynch, 1993; Dodge & Pettit, 2003; Matthews, Griggs & Caine, 1999; Tolan, Gorman-Smith & Henry, 2003). The South African literature identifies key risk factors, which combine in ways which have a multiple rather than additive effect on the likelihood of young people developing future criminal behaviour, as being: poverty, race, age, location of residence, gender, history of victimisation, coming from a dysfunctional family, poor school achievement and substance abuse (Matthews, Griggs & Caine, 1999).

The repeated finding that despite the risk factors, many children do not appear to suffer the predicted negative consequences, has led to a growing interest in resilience, a construct which connotes the maintenance of positive adaptation by individuals despite experiences of significant adversity (Garmezy, 1993; Luthar, Cicchetti & Becker, 2000; Werner & Smith, 1983). In the context of community violence in the USA, Garmezy identifies three sources of resilience: temperament factors (activity level, reflectiveness, cognitive skills, positive responsiveness to others); warm cohesive families with the presence of a caring adult; and external support, such as teacher, neighbour, parent of a peer or institutional structure like a school (Garmezy, 1993). Very similar sources of resilience were identified in case studies of children growing up in war zones (Garbarino & Kostelny, 1997; Garbarino, Kostelny & Dubrow, 1991). Such factors interact with the nature of violence exposure, with predictability, social and physical proximity also influencing children's resilience (Fick, Osofsky & Lewis, 1997; Osofsky, 1997). Younger children experiencing violence may face more negative consequences than older children, who have developed the reasoning and cognitive capabilities to adapt (Garbarino, Dubrow, Kostelny & Pardo, 1992; Perry, 1997).

These studies extend the focus from a direct causal relationship between violence and individual responses to a relationship mediated by a range of nested social systems. The family, for example, may increase both risk and resilience. Violence which affects early family relationships can create lasting problems of attachment, and potentially violent relationships (Fonagy, Target, Steele & Steele, 1997). But maternal stability and coping can also protect children from the harmful effects of community violence (Barbarin & Richter, 2001). Local belief systems and ideologies have also been identified as sources of resilience. There is some evidence that when ideology, such as religion, enables violence to be justified within the child's existing system of morality then this protects children from the negative consequences of violence (Garbarino, 1999; Straker, Moosa, Becker & Nkwale, 1992). In their analysis of growing up in war zones in Mozambique, Nicaragua, Palestine and Cambodia, Garbarino and colleagues

considered how an ideology can be “comforting”, and can enable children to be supported by a community united by belief (Garbarino, Kostelny & Dubrow, 1991). They contrast this with the experience of living in gang-controlled urban poverty in Chicago, where weak cultural ties and lack of common goals undermine active coping mechanisms.

A strength of the risk-resilience literature is the growing sensitivity to context (Dawes & Donald, 2000). The argument that the different levels of the ecological system interact and influence each other is persuasive, with resilience compensating for, protecting from or challenging the impact of risk factors. Moderate amounts of stress, for example, may strengthen children’s ability to cope in the longer term (Dawes and Donald, 2000). At the same time, however, the mechanistic approach of measuring relationships between variables results in an oversimplification of the complex relationships between the child and the social world. It relies for its data on pre-coded surveys and questionnaires, frequently imported or modified from instruments developed in the West. Such instruments may distort local experiences and interpretations of violence. The language of abuse used in the West, for example, has been found to make little sense to many black, working-class women in South Africa (Levett *et al.*, 1997). Diverse forms of violence are lumped together into an explanatory variable, and the complex power relations which produce violence are ignored. The focus of interventions stemming from this approach is on prevention, targeting particular high-risk groups. While this may be important in channelling welfare support, at the same time it reinforces the tendency to ‘blame’ those risky individuals, those poor, black males identified in the South African literature as at highest risk, labelling them as dangerous and in need of control, and who, it is assumed, will become caught up in the inevitable cycle of violence. But reviewing the psychological literature points to the variability and diversity in children’s responses, and highlights the need to consider not just possible outcomes, but the processes by which young people make sense of and interpret violence.

Social Perspectives on Children and Violence

Sociological and anthropological studies of children and violence shift the focus from individuals, or individuals within nested systems, to analysing the social systems themselves. Rather than testing out hypotheses, ethnographic approaches facilitate the creation of rich pictures of social phenomena. Psychological studies have been hugely influential on policy and practice, perhaps because of developmental psychology’s historical hegemony in childhood research (Mayall, 2002), perhaps also because the findings can be generalised across settings and offer practical ways forward. Additionally, methods like questionnaires, surveys and clinical assessments may be less challenging to conduct than ethnographies, which involve extensive time ‘in the field’, often with personal risks to the safety of researchers and their participants. Nonetheless, ethnographic studies have provided rich descriptions of young people’s lives in adverse social contexts, documented the multiple forms of violence they experience and considered the multiple meanings, functions and consequences of violent social relations (Bhana, 2002; Hecht, 1998; Henderson, 1999; Jones, 1993; Kilbride,

Suda & Njeru, 2000; Reynolds, 1989; Wood, 2002). Through spending extensive time living or working in these communities, and developing close relationships between the researcher and the research participants, these studies are able to explore experiences of violence which are often taboo or private (Lee & Stanko, 2003).

Recurring through these studies is a multi-dimensional definition of violence, which is inextricably connected with power, and generates a more nuanced analysis than the narrower view of violence as an explanatory variable which dominates the positivist psychological literature. This body of work illuminates complex historical and social processes in the reproduction of violence. David Rosen's study of child soldiers in Sierra Leone, for example, traces the roots of children's recent engagements in warfare in pre-colonial and colonial slavery, and more recently in post-independence politics, in which a patrimonial political system has created relationships in which young people are dependent on 'big men' for their livelihoods and social status:

Young men provided the big men with the physical strength, energy and fearlessness needed to intimidate and murder political rivals. In the despoiled circumstances of Sierra Leone's economy, the ties of dependence and violence among big men, young men, children, and youth rippled through rural and urban communities, disrupting and distorting ties of family and kinship. (Rosen, 2005)

Rosen's analysis demonstrates how coercive social relations, supported by violent practices, provide the conditions for children to participate in horrific wartime atrocities. Controversially however, he argues that, rather than passive victims of adult criminal exploitation, child combatants more often make rational decisions that not fighting is a worse option than fighting.

A rich body of work in South Africa has traced links between colonial and in particular apartheid policies, and the erosion of or breakdown of institutions like the family. In his study of 10–15-year-old children growing up in migrant worker hostels near Cape Town, Jones shows how the apartheid policy of forced labour migration disrupted families, creating childhoods filled with domestic flux and upheaval (Jones, 1993). In overcrowded living conditions, domestic violence was widespread and retributive violence was often socially sanctioned. Through violence in play, including fighting with sharpened sticks, knives, screwdrivers and bottles, children mimicked violence they had witnessed, thus providing practice for violent lifestyles. Violence then could function as a resource in the context of fragmented and uncertain childhoods.

In a longitudinal ethnographic study of 10–16-year-olds in a Cape Town township, Patricia Henderson also considered the functions of violence in children's lives (Henderson, 1999). Violence was viewed as re-moulding temporarily, social situations – to commandeer scarce resources, to create new configurations of power or to express dissatisfaction and frustration. She emphasises the importance of viewing violence within its specific social location, since violence has so many layers, and different consequences. So, for example, although violence plays a major part in the lives of two boys, for one, a "comrade" (youth affiliated to political organisations), the violence was socially sanctioned and therefore open for discussion and reflection, while for the other, who was a gang member involved in crime, it was not sanctioned and he was

therefore often silent about these locales of his life. Violence was often viewed by children with ambivalence, so, for example, fighting with gangs was seen as empowering, but children also criticised excess – one child would fight with a brick but not with a knife. Henderson views violence as a short-term solution, using a metaphor of a hall of mirrors in which violence is not a solution but infinite reflections – of men beating their sons to try to end gang violence, of boys joining gangs to protect themselves from the violence of other gangs: “the practitioners of different forms of violence jostled for claims to streets and attempted to fix particular kinds of relations of power within them” (p. 102). For Henderson, the multi-layered violence has reverberations for children’s social relationships at all levels, including the potential fragmentation of identity: “the cultural repertoires they employed to ‘re-stitch’ the social fabric were unable to effect an end point in the process” (p. iii).

The gendered dimensions of violent practices, remarkably underexplored in the psychological literature, have been central in much of the social literature. Studies in a range of post-conflict settings have traced how violence may be a means to commandeer scarce resources, which becomes incorporated within masculine identities (Barker, 2005; Bhana, 2005b; Reilly, Muldoon & Byrne, 2004). Researchers have traced how gendered violence may arise from ‘thwarted’ masculinities (Moore, 1994), when men are unable to live up to the expectation of providing support and protection for the family (Ramphela, 2000). Such gendered violence, together with harsh forms of physical punishment, teach children that personal relationships may be shaped by through force, in which the strong exert their will over the weak (Morrell, 2001; Ramphela, 1996). In an ethnography of sexual health and violence among young black men living in a working-class South African township, Katharine Wood traced how gendered violence was both productive and unstable (Wood, 2002). For the young men she studied, violent practices helped to impose inequality in sexual relationships, producing a hierarchy of gender, but not altogether successfully:

For young men, the importance of women to their sense of masculinity, both in terms of their own self-respect and esteem and in the eyes of others, was evident in the energy they expended on acquiring girlfriends, gaining sexual access to them (and seeking to establish exclusive sexual access), surveilling them and attempting to control their behaviour. The vast majority of acts of violence against young women emerged out of these practices (Wood, 2002).

In order to maintain their social status, constant vigilance was necessary, with violence a way to attempt to establish and maintain uneasy control. What is clear in all these studies is that while violence may be functional in helping men to construct particular social identities, there are unforeseen and negative consequences – in the health risks discussed by Wood, and in the breakdown or fragmentation of relations discussed by Henderson, Ramphela or Rosen.

Many of these studies focus on young adults rather than on children, but there is also a strand of the social literature which explores how violence seeps into children’s everyday spaces. Studies investigate how schools, often viewed as safe havens may be sites in which violence is reproduced (Bhana, 2005a; Chatty & Hundt, 2005; Davies, 2004; Dunne, Humphreys & Leach, 2006; Dunne & Leach, 2005; Harber, 2004;

Leach, 2006). Through the gendered hierarchical relations, systems of punishment and in playgrounds where force is a frequent means of negotiating relationships, researchers have traced the reproduction of the violence of the neighbourhood. There are also ethnographic studies of children living and working in the streets, in spaces which are not viewed as legitimate contexts for children. Stepping into these 'prohibited' spaces may create risks for children. Children living and working on the streets of Brazil or Kenya may be escaping from violence within their homes, to face physical assaults and rape in the neighbourhood, from other children and from adults admonishing their illegitimate movement (Hecht, 1998; Kilbride, Suda & Njeru, 2000).

Many of the ethnographic studies do not set out to study violence, but in exploring children's lives in adverse social contexts, find that children have to cope with multiple forms of violence. These studies describe the resourcefulness and resilience of children. But there is also a sense that children are adopting survival strategies, often employing violence, to cope with immense hardship and the prospects for the future may be bleak.

Centring Children's Perspectives

The literature shows how violence has many reverberations in children's lives. The psychological studies explore the consequences on children's emotions, their development and family relationships. Children's responses vary with age, gender and the nature of and proximity to violence. It also shows that many children are resilient, that they seem to be protected from some of the negative consequences, perhaps because of the social support within families, or because of the ways in which they appraise or make sense of violence. These ways of making sense though are not well understood.

The social literature offers a rich analysis of life in a context of violence, illustrating the complex meanings attached to violence within the web of social relations in children's lives and drawing close connections with experience, history and culture. These studies show the importance of understanding violence as social interaction which has multiple meanings. While they add considerable depth to our understandings about children and violence, it is not difficult to see why they have had less influence than the psychological literature on policy and practice. Most are small-scale, located within specific social locations and the authors are cautious about making generalised claims. The relationships they identify are complex, difficult to disentangle, with deep historical and social roots that do not lend themselves to quick fixes. Change implies fundamental upheaval of power relations at the macro-level, as well as at the micro-level of beliefs and practices in local neighbourhoods.

As in the psychological literature, there is a sense in much of the social literature, in which the child remains an object of the researchers' gaze, vulnerable and innocent and at the same time caught up in cycles of violence in which she/he is powerless. Increasingly, however, these studies are reconceptualising children as active agents, and are beginning to consider the psychosocial processes through which children interpret and try to make sense of their social worlds. They engage theoretically with a rights-based sociology of childhood (Boyden & de Berry, 2004; Christensen & James, 2000; Mayall, 2002), and with theoretical developments in psychology which stress

the social construction of learning and identity construction (Bruner, 1990; Cole, 1996; Goodnow, 1990; Stigler, Schweder & Herdt, 1990; Wetherell, Taylor & Yates, 2001). This work, which utilises both ethnographic and participatory research approaches, examines how, as they construct their social identities, young people negotiate conflicts and tensions.

Criticising the homogenising views of the 'refugee' child utilised by humanitarian agencies, Jason Hart explored the fluidity of children's identity formation in a Palestinian refugee camp in Jordan. Discourses around age, gender, social class, personal history, religious faith and political views collided and clashed with the perspectives of their parents, in diverse ways which "may sprawl untidily across the neatly-drawn bounds of collectivities suggested by older generations" (Hart, 2004). Another study of children in Palestinian refugee camps in Lebanon, Syria, Jordan, Gaza and the West Bank, explored how children negotiated their identities as Palestinians, refugees, camp residents, and as Muslims or Christians (Chatty & Hundt, 2005). Political and military conflict was mirrored in the relationships central to children's lives, within families and schools. Young people faced competing and conflicting discourses. For girls, for example, marriage could be viewed as protective at times of instability or as a way to escape the economic and social constraints of their homes, in which their movements were circumscribed, but also as preventing them from completing education. And while education was viewed as enabling them to lead more productive, fulfilling lives, the curriculum was frequently viewed as inappropriate and irrelevant and violence was common in the school setting (Chatty & Hundt, 2005).

In my own work with children in a working-class South African township, young people grappled with conflicting and seemingly contradictory viewpoints as they negotiated their identities within a context of multiple forms of violence (Parkes, 2005). For boys, for example, strength, fearlessness and fighting skill were sought-after attributes, and in their accounts of crimes against their families, they discussed the importance of men and boys protecting their homes, with violence if necessary. Yet at the same time, they were highly critical of young people who joined gangs. As they talked, they adopted uneasy subject positions, speaking proudly about their associations with local gangs, and thus reaping social status from these connections, while adamant that they would not adopt the violent practices of gangs themselves (Parkes, 2007). Boys and girls talked of the need for harsh punishments to maintain law and order, yet were cynical about the effectiveness of such punishments. Interestingly, over the course of our discussions, which took place over several months in 2001, they appeared to shift their views about possible solutions to problems of violence, increasingly proposing verbal problem-solving and negotiation as ways of contesting violence. It appeared that the subtle interplay of power and pleasure in the research relationship, in which young people felt that their views were listened to and valued, may have generated the perception of increased reflexive agency (Parkes, forthcoming).

Placing at the heart of psychological and social research the views of young people may expand our understanding of the diverse ways in which girls and boys negotiate the complex and contradictory discourses around violence. While this work is in its infancy, it begins to identify recurring patterns in how children cope, often simultaneously contesting

and perpetuating violence. It also alerts us to possibilities for change, while recognising how children are deeply embedded within highly constraining social contexts.

This work, which synthesises psychological and social approaches, together with a conceptualisation of children as active participants in their social worlds, points to interventions which engage with young people's perspectives (Daiute & Fine, 2003). For some children, as indicated by the psychological literature on trauma, psychotherapeutic interventions designed with sensitivity to local contexts and traditions, may be crucial to help cope with the horrific consequences, at the level of individual or community, and to support the rebuilding of relations fractured in war and conflict. For others, intervening early to support families in high risk settings may disrupt possible cycles of violence. At the same time, as stressed in the social literature, it is critical that interventions address and challenge the coercive social relations underpinning conflict. Within schools, such interventions could focus on human rights, social justice and peace. Across these multiple layers of intervention, it is important to avoid universalising, homogenising understandings of childhood, which marginalise children and render them powerless. Instead, understanding that children act upon and influence their social worlds, in ways that are not fixed but are diverse and fluid, we can develop frameworks of negotiation and dialogic pedagogy in which young people are invited to discuss, challenge and reconstruct perspectives and relationships, and to explore possibilities for changing violent social relations.

AN INDIGENOUS DISCOURSE TO CRADLE OUR COGNITIVE HERITAGE AND SCRIPT OUR ASPIRATIONS: REFLECTIONS FROM INDIA AND AFRICA

Anita Rampal

The Modernisation–Indigenisation Dilemma

In a meeting of the Rural Schools Project (Nelson Mandela Foundation, 2005) in South Africa in 2004, I inadvertently stirred a hornet's nest. I had wondered why plastic tables and chairs were considered such a priority in primary schools, even at the cost of other pressing needs to ensure better learning. In South Africa and India most children do not sit on such furniture as part of their home culture. There was an expression of loud fist-thumping indignation by many black educators, declaring that things they had earlier been deprived of in schools should now be 'rightfully' theirs. How can children write otherwise? It was demeaning and inhuman 'to sit on the floor and write', they proclaimed. Well-meaning emotion, perhaps, but somewhat misplaced. It refused to acknowledge the coherence of culture and cognition. An interesting debate ensued, and at one point I went on to demonstrate how most people in India still chose to sit on the floor cross-legged, even in prestigious political meetings or musical gatherings. This is the basic posture many Westerners might pay substantial sums to emulate as part of their yoga classes! However, the question remained. Why was Africa, the Cradle of Writing, held in deference by the world for its ingenious initiation and imaginative use of papyrus and quill, now finding it demeaning to write without tables and chairs?

Significantly, most black educators participating in the Rural Schools Project felt that education has little to do with 'culture' or 'identity'. These words, unfortunately, still carry for them connotations of the colonial and apartheid past, when 'culture' was used as the basic signifier of colour and 'race'. Ironically, the present seems endangered with another kind of 'culture'. This one chases the elusive 'Western dream' through schooling with a vengeance. 'Equality of opportunity' is sought, somewhat superficially through unquestioning emulation, to somehow 'catch up with them', and sadly, on 'their' terms not 'ours'. Western dress, furniture and architecture, and teaching in the English language (often without comprehension, and mostly through rote) are only some instances of this culture, vehemently demanded, as 'our basic rights' in school. A contemporary 'indigenous' discourse on education is urgently called

for, to reconstruct the social reality of people that has long been scripted elsewhere. In the present globalising scenario there is a greater need to decolonise the mind of plagiarised aspirations.

The ‘indigenous tradition’ of schooling had emerged out of alternative educational ideas rooted in the anti-colonial struggles of low-income countries that challenged ‘imported’ knowledge, images, values and beliefs. For instance, Mahatma Gandhi and Julius Nyerere, both stressed education for self-reliance, equity and rural employment. The indigenous tradition is therefore seen as one that:

- Reasserts the importance of education’s relevance to the sociocultural circumstances of the nation and learner
- Assures that relevance implies local design of curriculum content, pedagogies and assessment, using learners’ rich sources of prior knowledge
- Moves beyond the boundaries of the classroom/school through non-formal and lifelong learning activities. (UNESCO, 2005, p. 34)

The Gandhian model of Basic Education (Hindustani Talimi Sangh, 1938) called for ‘education for life, through life’ and used a productive craft – weaving, carpentry, agriculture or pottery – as the medium of interdisciplinary hands-on learning in the primary curriculum, with the mother tongue as the medium of instruction. At the upper primary stage the distinction between traditional ‘academic’ and ‘vocational’ streams was sought to be reduced through flexible tracks, where science, home science or agricultural science could be placed at par. This radical move matched the agenda of the anti-colonial freedom struggle for inclusive schools independent of government funding. It required an interrogation of the traditional caste system that stigmatised those belonging to the low-castes and their vocations. Basic Education schools continued to run in the 1950s, after India became independent, but did not receive sustained support from the government and the elites aspiring for white-collar employment through ‘modern’ education.

The decolonising discourse on education saw a historic debate (Bhattacharya, 1997) between two major Indian thinkers – Gandhi and Tagore – whose respect for each other refined their differences and also enriched the discussions on issues such as, development, nationalism, education, language, science and its domination. Gandhi led the movement of ‘non-cooperation’, and supported the ‘swadeshi’ (the indigenous) with the boycott of British goods, including British-run schools. Tagore ran his own indigenous school but felt, as he wrote in a letter to Gandhi in 1921, that the “struggle to alienate our heart and mind from those of the West is an attempt at spiritual suicide ... [as indeed] for a long time we have been out of touch with our own culture” (ibid. p. 62). Gandhi maintained: “It is unbearable for me that the vernaculars should be crushed and starved as they have been. I hope I am as great a believer in the free air as the great Poet. ... I want the cultures of all the lands to be blown about my house as freely as possible. But I refuse to be blown off my feet by any” (ibid. p. 64). Both developed distinct models of indigenous education. However, Tagore questioned the centrality of manual work in Basic Education, at the cost of art and aesthetics, and wondered if it amounted to a differentiated form of education “doled out in insufficient rations to the poor” (ibid. p. 34), who thus get assigned to a limited place and vocation.

The historic Gandhi–Tagore engagement reconnects with several contemporary educational debates. Indeed, the curriculum does manifest as an ongoing ‘complicated conversation’ – and a ‘social and subjective reconstruction’, that allows an analysis of “one’s experience of the past and fantasies of the future in order to understand more fully, with more complexity and subtlety, one’s submergence in the present” (Pinar, 2004, p. 4). The modernisation–indigenisation dilemma of the 1920s continues to reconfigure now in several countries, around differently nuanced curricular dimensions, ranging from the ‘developmental–ecological’ crisis, ‘rational–moral’ values, ‘academic–everyday’ knowledge, ‘intellectual–manual’ work, English or mother tongue as the medium, to the material–cultural politics of identity (Rampal, forthcoming).

The first Education Commission of independent India (Government of India, 1966) had advocated ‘non-violent science’ for development, so that India could engage in ‘reinterpretations and re-evaluations’ of its deep fissures of inequality and injustice, using ‘its own cultural resources of compassion, tolerance and spirituality’, while it drew upon the new liberalising forces that had emerged in the West. However, attempts to incorporate cultural or civilisational resources in education have been part of major political contestations, especially in multicultural countries with complex colonial histories.

An indigenous discourse on schooling calls for new metaphors for the notion of a ‘national’ or ‘multicultural identity’. One metaphor for the dynamic and diverse society sought in post-apartheid South Africa is that of the ‘Garieb’ (The Great River), proposed by Alexander (2002, p. 107). In this the mainstream is composed of a confluence of all the tributaries, which in their ever-changing forms continue to constitute and reconstitute the river, such that no single current dominates, and there is no ‘main stream’.

In the Indian context, independence came with partition and the formation of Pakistan, which left a long trail of violence, communal frenzy and, subsequently, even linguistic strife. This history marked the continually problematic process of carving a national identity through the education system. A Committee for Emotional Integration, set up by the Ministry of Education (1962, p. 3), had felt compelled to assert that:

[u]nity is not uniformity. No one is asked to give up his faith in the religion of his fathers, his love for the language which the poets – who have inspired his life and the life of thousands like him – chose as the medium of expression, for their sense of truth and beauty. ... Such loyalties do not detract from the loyalty to the nation: rather they add depth to it and, in turn, derive meaning and significance from that over-all loyalty which is the nation’s due.

However, a plurality of loyalties have continued to disturb the agenda of the nationalist-chauvinists, who strive to establish the hegemony of the culture and language of the dominant ‘main stream’, carved out of a religious and caste identity. Education has remained a politically contested site for the schooling of dominance – of caste, class, religion and gender – despite radical committees and secular policies that have challenged these divisive designs. For instance, through the National Curriculum Framework (NCF) 2000, a right-wing party in power at the centre promoted a form of cultural imperialism of the dominant religious identity, and textbooks presented a

distorted and divisive view of history (SAHMAT and Sabrang, 2001). A change in government recovered the secular space in the subsequent NCF 2005, but since school curricula and textbooks are prepared by state governments, the right-wing ideology continues to prevail in some states. Lall (forthcoming) analyses the increasing contestation over issues of national identity to argue that “fundamentalisation in general, and curricular fundamentalisation in particular are state-controlled discursive mechanisms through which to contain and deflect potential dysfunctions produced by the effects of globalization in societies”.

Language has been a particularly sensitive issue after India gained independence. Religious chauvinism combined with the political hegemony of the Hindi-speaking heartland demanded a highly classicised Hindi as the ‘national’ language. Through much political debate the country refrained from declaring a ‘national’ language, but instead termed Hindi the ‘official’ language, with English as an ‘associate additional official language’, to serve as a link between the plurality of regional or state languages. The Constitution (Article 351) also directed that:

it shall be the duty of the Union to develop the Hindi language so that it may serve as a medium of expression for all the elements of the composite culture of India and to secure its enrichment by assimilating without interfering with its genius, the forms, styles and expressions used in Hindustani and in the other languages of India.

The Official Language Commission was set up and several committees deliberated upon how the Indian languages needed to be developed. It recommended that new terminologies should not be ‘concocted in a literary workshop’ but drawn from the vocational language of crafts-persons, artisans, technicians and semi-skilled workers who are not familiar with English but manage to devise their own hybrid forms of technical and scientific terminologies. However, the course of events that followed, unfortunately, went contrary to the wise counsel of the Commission and even the Constitution. Not only were words not mined from the quarries of artisanal ‘dialects’, but words from colloquial vocabularies were even purged as ‘alien’ or ‘Islamic’, in favour of the often more contrived terms coined from Sanskrit. Terms in this official form of Hindi were not carved from the dynamic heteroglot and extensively used Hindustani, which had indeed grown out of the composite culture of diverse communities, thus forging strong emotional bonds of shared memories. Moreover, what emerged out of the violence of the struggle for what Rai (2001) calls ‘Hindi Nationalism’, was bereft of the creative genius of Hindustani. It was effectively a regional language in opposition to other regional languages, invented by one ‘upper caste local elite desperate to exercise national dominance’:

It has defined itself against a range of other contenders for so long – Urdu but not only Urdu in the earlier phase, English later – that a kind of prickly defensiveness has become one of its deepest characteristics. ... For all its irrelevance to the real world of literary practice, and to the world of everyday language use, this ‘Hindi’ continues to exert a poisonous influence through its continued dominance within the education system. ... This official ‘Hindi’ is primarily responsible for the

construction of cultural memory in the Hindi region; in classroom after classroom, in childish essay and scholarly dissertation, the practice of this 'Hindi' is a ritual re-enactment of the logic of partition. (Ibid. pp. 118–119)

An alienating discourse of education took root in most states, even where the medium of schooling was chosen to be the state's regional language. Terminologies and technical words were artificially foisted on learners without any consideration of their processes of cognition and communication. However, in the state of Kerala in South India, which has much higher levels of literacy than the rest of the country, a serious attempt was made to develop new terminologies from familiar existing words. Several words were coined as derivatives from English but with a suitable Malayalam suffix. A dictionary of 40,000 terms was compiled by the mass organisation 'Kerala Shastra Sahitya Parishad', then a relatively small voluntary group of academics working for the popularisation of science. This was a landmark achievement and helped the organisation in mobilising large-scale support from ordinary people, with which it spearheaded the Silent Valley environmental campaign and its mass-based People's Science Movement. This example underscores the need for creative indigenous interventions which carve people's ingenuity with their own languages and buttress the cradle of educational expansion. Similar concerns have been voiced in South Africa, where English still remains the dominant language of school, and efforts are on to ensure the development and 'intellectualisation' of local languages (Odora Hoppers, 2002; Dlodlo, 1999).

Whose Knowledge Has Value?

In Africa, South America as well as South Asia there have been calls for a critical re-appropriation of indigenous knowledge with an end to 'extroversion' of all forms, including economic, scientific and technological. School history curricula have been reviewed from the subaltern perspective, and October 12, the day Columbus reached the 'New World', has now been declared as the 'Indigenous Resistance Day' in central and South America. Social movements have called for an audit of the 'ecological debt' of the colonising countries, which through centuries of exploitation of mineral and other natural resources of the Third World, have caused its deep economic debt. There is a need to reassert and claim a similar acknowledgement of their 'cognitive debt' to the indigenous knowledge of the oldest civilisations.

The development of modern science was based on several knowledge traditions, which included the traditions of simple cultures that came in contact with the voyages of discovery or were part of the colonies of Europe. However, in the course of the spread of modern science these other traditions were either consciously delegitimised or even 'cognitively lost' to science. Our cognitive heritage needs to be critically re-examined and reclaimed, not to be exploited in the global market, but to enrich our indigenous systems of economic and knowledge production. For the latter, our schools must serve not only as indigenous sites of production of new knowledge but, equally, of relegitimation and appraisal of some of these lost traditions.

Some examples of such traditions being lost through formal education focus on the question of whose knowledge is currently valued in schools. The tribal or rural child is knowledgeable about the natural world, and does not need to look at ‘pictures’ to count the legs of a spider, to identify the eggs of a frog or the leaves of a *neem* tree. She may learn from her community about metal casting, or gain knowledge to identify medicinal herbs and the rich biodiversity of her forests, which foreign companies often aggressively vie to patent and commercially exploit, but, ironically, schools do not value. Moreover, the structure of schooled knowledge makes the rural or tribal child struggle with meaningless representations even in matters she knows much better (Rampal, 2000). Such cultural dissonance between indigenous knowledge, language and school science has also been noted in the case of Maori children (McKinley, McPherson Waiti & Bell, 1992).

Goonatilake (1998, p. 67) stresses the need to consciously ‘mine civilisational knowledge’ to change the traditions of modern science, through a rich array of techniques, metaphors and intellectual solutions:

Recent work of anthropologists on these small social groups, so called ‘primitive’ peoples, reveals that the impulse to be scientific is universally present. I focus on these societies deliberately, because the Scientific Revolution began after the voyages of discovery, and aspects of both projects interacted with each other, namely, the search for science and the search of the Europeans’ “other”. The imperialist perspective that accompanied both events soon began to assert the superiority and exclusivity of everything considered European. Soon, these attitudes crystallized, to varying degrees, into a view that other cultures were inherently incapable of the intellectual work that goes today under the rubric of ‘science’. And this perspective has coloured subsequent views on knowledge, views that only over the last two decades or so are being gradually rethought.

Curiosity about nature was not only kindled but systematically formalised and nurtured in every major civilizational area, with significant cross-transmission and cross-fertilisation of ideas between them. For instance, folk biological classifications made by different groups across the world have been seen to be remarkably similar in different settings, based on objective observations using similar criteria. Field studies of attempts at classification by American students who had no formal training in biology and no prior knowledge of the specimens they were asked to classify, showed that they all came to similar classification systems based on observed criteria (Boster, 1987). An increasing body of work in ethnobiology and anthropology shows that indigenous peoples have independently observed the environment and come to similar conclusions and taxonomies, largely out of an intellectual urge, more than a purely instrumental need. “The difference between a Linnaeus, the eighteenth century founder of the modern classificatory system, and a folk classifier, becomes one partly of degree. Linnaeus (like the other modern scientists after him) had access to a wider store of plant samples, created through European expansion into the rest of the world” (Goonatilake, 1998, p. 70).

The Civilising Agenda of School?

Not only do schools dismiss the civilisational knowledge resources of tribal children but they also subject them to a severe sense of alienation, while their very existence and identity is described in demeaning terms. Teachers are deeply conditioned by social biases against indigenous tribes and refer to them stereotypically as ‘uncivilised people engaged in drinking and dancing, and not interested in education’. In a textbook for Class 6, questions about ‘where in the State are tigers found?’ were framed in exactly the same way as ‘where are tribals found?’ No effort was made to even semantically differentiate between ‘where people are found’ and ‘where people live’. Generally no tribal characters and no tribal names appear in school books. In fact, teachers are always ‘correcting’ tribal names, since they find them awkward and consider those to be distorted versions of ‘proper’ Sanskrit names.

Spatial metaphors have played a role in the framing of emancipatory pedagogies to counter the domesticating tendencies of education, ranging from phenomena of “border crossing” to “legitimate peripheral participation” (Edwards & Usher, 2000). In countries of the South the urban poor today are witness to increasingly dehumanising, even ‘savage inequalities’, as the city reconfigures and monstrosly metamorphoses into a modern metropolis. In addition, the media relentlessly imprints surreal images on young fertile imaginations and blossoming aspirations; jazzy Jacuzzis and fancy fittings seem to acquire a commonplace realism while modest taps and sanitary latrines remain remotely unimaginable. Yet schools make no attempt to scaffold the ‘spatial consciousness’ of a poor child to interrogate “the relationship that exists between him and his neighborhood, his territory, or to use the language of the street gangs, his ‘turf’” (Harvey, 1973, p. 24; Rampal, 2007).

The school textbook usually maintains an inert distance, refusing to acknowledge the lives of the tribals, and deals with survival issues in a cold, sterile manner. Assuming that everyone lives in a brick and mortar bungalow provided with tapped water, it preaches ‘water conservation’ so that taps are not kept running while brushing one’s teeth. It also deliberately evades any conflicting issue seen as ‘uncomfortable’ by its middle-class urban authors, and unabashedly pontificates on what ‘they’ – the poor and the ‘unclean’ – must do to keep themselves clean. There is an implicit understanding that while education must inform ‘those backward’ children on how to conduct their lives ‘properly’, it should project only happy and ‘positive’ situations to protect the ‘innocence’ of the privileged. Textbooks traditionally contain highly prescriptive and moralistic lessons (about hygiene, cleanliness, hard work, etc.) together with naive and insipid generalisations about the lives of the poor. In fact, under ‘types of houses’ the concrete bungalow, the semi-pucca house and the ‘*jhuggi*’ (makeshift shelter) are presented just as if these constituted another natural ‘scientific’ taxonomy, as in plants or soil types! Moreover, a ‘good’ house is always defined as one with a kitchen, toilets, windows and electricity. Millions of children who live in conditions that do not conform to these norms are deliberately alienated, and receive signals that their life style is ‘bad’.

The ‘civilising’ agenda of school has almost been timelessly and righteously imposed on poor children, who supposedly need to be ‘rescued from the abyss’, where the discipline of school is meant to be contrasted with the chaos and squalor in their homes.

In fact, the disdain faced by the urban poor in our present schools is reminiscent of nineteenth-century England, where the Compulsory Education Act of 1870 gave state sanction to the purported maintenance of ‘order’ through often oppressive measures. Education was enforced with prosecutions and fines, with seizure of goods if parents could not pay, and even prison. Order and obedience came with cleanliness, vested with the same moral righteousness, the same sense of ‘shame’, and even greater priority than instruction (Davin, 1996).

Unpacking the Packaged Discourse

The exclusion of the knowledge of poor, rural children from the curriculum is exacerbated by the languages through which schooling is delivered. The discourse of school has normally been highly transactional, impersonal and dense, with encapsulated information that is expected to be memorised, since children in any case cannot make sense of it (Rampal, 1992a). The hegemony of the heavily classicised terminology used in the regional languages has made science and mathematics doubly debilitating for children in government schools. This contributes to a large extent to their failure to cope with these subjects.

The Ministry of Human Resource Development appointed a Committee in 1993 to help reduce the ‘burden of the school bag’. Its report ‘Learning without Burden’ (Government of India, 1993) was prefaced with the observation that the gravitational load of the bag was not the main problem, but “that the more pernicious burden is that of non-comprehension. In fact, a significant fraction of children who drop out may be those who refuse to compromise with non-comprehension – they are potentially superior to those who just memorise and do well in examinations, without comprehending very much!” It was sharply critical of the overarching trend to package as much information as possible in a ‘highly compressed and abstruse manner’ and noted that:

Barring exceptions, our textbooks appear to have been written primarily to convey information or ‘facts’, rather than to make children think and explore. ... The distance between the child’s everyday life and the content of the textbook accentuates the transformation of knowledge into a load. ... Even books used for teaching the mother tongue are written in such a stylised diction that children cannot be expected to recognize this language as their own. Words, expressions and nuances commonly used by children in their milieu are absent. So is humour. An artificial, sophisticated style dominates, reinforcing the tradition of distancing knowledge from life. (Ibid. pp. 7–8)

Often the rhetoric of ‘activity-based’ teaching may be adopted by textbooks but there is no attempt to promote any exploration or activity. Children are asked to observe the ‘picture’ of an object, rather than go out and look at the ‘real’ thing, be it a common sparrow or the leaf of a plant, and the conclusions are already provided about ‘what will be observed’. A typical passage on ‘Weather’ from a Class 3 textbook ‘Exploring Environment’ shows how distant it is from a truly exploratory approach. Notice the

density of the text and the use of statements that actually do not explain anything (Rampal, 2002; PROBE Team, 1999):

When water evaporates it changes from liquid into water vapour. Water vapour is the gaseous form of water. Wet things dry when the water in them becomes water vapour and moves into the atmosphere. You cannot see water evaporating into water vapour. Water vapour exists in the form of very tiny particles.

Most of these sentences do not offer any real explanations, and for these concepts on evaporation and states of matter it is not even possible to do so for children this age. They are only statements that go round in circles, as tautologies. If a child asks 'But what is water vapour?' she gets the answer 'Water vapour is the gaseous form of water'! Naturally the child stops trying to make sense of what is being 'taught', and falls in line with what is expected – to unthinkingly repeat what she has been told.

There has been little systematic attempt to get feedback from children and to elicit their perceptions about this kind of writing. It is generally believed that if they fail to learn in school there must be something wrong with them, for which they need all kinds of additional inputs, from tuitions to tonics. Eleven-year-old Gargi, a pupil in Mumbai, is one such exception. When asked to critically analyse her textbook, she looked at two pages from the chapter on 'Air' which contain a heavy density of unfamiliar terms and concepts, such as, crucible, mass, desiccator, clay pipe triangle, magnesium, apparatus, mercuric oxide. The book, supposed to be among the better textbooks, used by urban schools and published by a private firm, thoughtlessly goes into elaborate instructions for doing an experiment, normally given to high school students, to find the difference in the 'mass' of magnesium after burning it in air. Gargi dared to question the suitability of what was being taught. She sent me her expressive comments with a drawing:

The section on Priestley's experiment was most confusing. Mercury, red powder, heating, re-heating. ... Add to this Priestley, Lavoisier, glowing splinter, oxygen. ... Garbage! It went zoom over my head.

As a third-world country a major problem we have had to contend with, especially while designing curricula, is the notion of 'catching up' that India must do to become abreast of what is popularly called the 'global information explosion'. When told that European children, for instance, learn concepts of valence or chemical equations much later than their counterparts here, it is argued that those countries can now 'afford to go slow'. The latest National Curriculum Framework (Government of India, 2005) has promoted a social constructivist approach towards children's learning, with a focus on the cultural context of concept-formation. All children are natural theory-makers, and from much before they go to school they begin to construct their own theories and explanations for the world they observe. Learning in childhood is not a process of accumulating or storing information about different topics, but the ability to apply the understanding of one phenomenon to others. Children often form consistent 'alternative frameworks' or 'naive theories' that may even be contradictory to established knowledge (Driver *et al.*, 1985). Therefore, schools

need to consciously elicit, address and critically examine children's intuitive ideas before presenting new ways of looking at the world.

Many students fail in their mathematics exams, feeling frustrated at not being able to cope with numbers even later in life. Yet unschooled children and adults enjoy solving oral riddles and play folk games, with tamarind seeds or pebbles, which are entertaining and also sharpen their mathematical abilities. Traditional methods of estimation, sorting and measurement still used in villages have their own terminologies, which are meaningfully related to real-life contexts. We have found that unschooled children and adults who sell in the market or do vocational work are adept at mental arithmetic as part of their daily transactions, and use effective algorithms and strategies to get results (Rampal *et al.*, 1999; Rampal, 2003a, b, c).

The presentation of mathematics in textbooks has also traditionally been associated with entrenching gender inequalities. A detailed study of mathematics textbooks and teachers' manuals undertaken by Mary Harris (on behalf of the Commonwealth Secretariat) points out that the language of the Class 1 book, *Let's Learn Mathematics*, is already too formal and runs the risk of alienating girls right from the beginning of their schooling. "Girls find co-operative and generative ways of working a better way of understanding mathematics than the more definitional, hierarchical ways used in this text and indeed throughout the series" (Harris, 1999, p. 93). Thus, redressing gender imbalance in textbooks is not simply a matter of introducing more examples with women, but of understanding that women have continued to play an important role in accumulating and refining traditional knowledge in various spheres of activity.

Indeed, in the new primary school textbooks produced by National Council of Educational Research and Training (NCERT, 2006a, 2007, 2008; also at www.ncert.nic.in) we have consciously given place to children's unschooled knowledge of science and everyday mathematics. With a focus on those who are most vulnerable to be pushed out of school, and unlike the prevalent 'culture of silence' at school, some key questions openly address issues of inequality or difference, and encourage children to reflect on their lived experiences, however unpleasant. The syllabus for Environmental Studies for Grades III–V (NCERT, 2006b) uses an integrated approach, through 'themes' that allow for a connected and interrelated understanding of what may conventionally come under the subjects of Science, Social Studies and Environmental Education. This required moving beyond traditional boundaries of disciplines and looking at priorities in a shared way, with a focus on children's understandings and experiences rooted in diverse cultural milieu.

For instance, the theme on 'Food' begins with 'cooking' and 'eating in the family', and sensitises children to the notion that food is a deeply cultural concept. The key question 'Which of the following is food – red ants, birds' nest, goats' milk, etc.?' is meant to focus on the understanding of such differences, to promote tolerance, and also to address social biases about indigenous culinary practices. Certain tribal communities relish condiments made out of red ants or fried termites, but face oppressive discrimination from often insensitive and ignorant non-tribal peers and teachers. The theme then moves on to how food is grown, how it reaches the city, who grows it, and the hardships farmers face (in the light of the severe crisis in agriculture and unprecedented suicides by farmers), while staying grounded to the reality of our own pangs of hunger or the plight of people who do not get food. Further, changes in food habits and

crop patterns are analysed through the historical experiences of village elders/grandparents, not just from what the teacher or textbook says.

Themes on 'Water' and 'Shelter' in the syllabus include questions on the immediate issues of caste and deprivation in rural and urban environments. For instance, the following questions are meant to scaffold critical dialogue: How far do you have to go to fetch water? Are there some people not allowed to take water from your source? What are underground wells and do you still see them being used? Have you seen water being wasted? Are there some people in your area who always face water shortage? Do you find factories or people dumping garbage or harmful materials in rivers or seas? Similarly for 'Shelter': Does everyone have a shelter to live in? Why do people live together in hamlets/colonies/neighbourhoods? The syllabus and the textbook also include narratives of a child displaced by the construction of a dam or the demolition of an urban slum.

The new NCERT textbooks based on the revised syllabus have been introduced in schools in 2006. As our team continues to work on the Environmental Studies (EVS) textbooks we have been through a process of debate and reflection. To remain sensitive to all children and to consciously include the lived realities of the rural and tribal child is indeed a challenge, especially when most of us – teachers and educators – are from among the urban educated sections of society, with increasingly fewer shared spaces of social and cultural interchange. For us tapped water (though now in short supply in most cities) or personal toilets are unquestioned essentials of urban life, while many other markers of our middle-class existence – be it cooking gas, a refrigerator, an ice cream cone, or even ordinary coloured paper – might unthinkingly appear in the chapters we draft. We also continue to contend with a middle-class moralistic discourse on hygiene and cleanliness, and the belief that the poor need the 'right messages' through school. Nevertheless, we have made space for different children's voices and concerns, from diverse regions, cultures and socio-economic backgrounds – of those whose houses are washed away by floods each year, and also those who walk miles to get a pot of water. We have consciously included several real-life narratives of inspiration and transformative action for the textbooks for language, mathematics and EVS in grades III (NCERT, 2006a, 2007, 2008).

Scientific Temper and Social Beliefs

Science for development has been a shared dream in most third-world countries, including South Africa and India. However, often an overly positivist and even erroneously glorious view of science is projected as the panacea for all national problems (Rampal, 1992b). Scientific thinking is perceived to be in direct confrontation with peoples' religious and customary beliefs, superstitions and traditional practices. Standard courses in school allow no room for thought and critical reflection to intelligently deal with students' indigenous knowledge or to sensitively interrogate social beliefs.

The media mindlessly beams a barrage of often crude and condescending messages, again with no attempt at critical inquiry or communicative explanation. For example, in a regular 'social advertisement' on Indian television, a commanding disembodied voice interrogates the poor housewife on whether she had cleaned the plates well, and

even patronisingly orders viewers to wash their hands before eating (and after defecating). This format is immensely offensive and gender-insensitive. Even in the parched drought-prone desert of Rajasthan, where women solely bear the backbreaking burden of carrying several pitchers of scarce water from long distances, they show enough indigenous acumen and plain good sense to scrub their utensils clean with sand. Similar condescending messages on the vaccination of children or about keeping food covered seem to place the blame entirely on the poor viewers for their illness, absolving the state of its responsibility to provide basic amenities such as potable water or primary health care. There is no popular scientific attempt to communicate *why* vaccinations help or *what* happens with contaminated food, so that this didactic discourse is almost similar in its import and spirit to any other knowledge claim arising out of ‘unscientific’ systems of belief.

The inculcation of scientific thinking is a slow and complex process, and remains embedded within the various complementary layers of social cognition – between myths, beliefs, folklore, superstitions, taboos, etc. – that have influenced people’s thinking for centuries. Such beliefs broadly constitute what Horton (1970) calls a ‘closed’ system of thought, characterised by a lack of awareness of alternatives to the body of tenets espoused and constrained by the tendency to reason only within a ‘limited idiom’. The language of science needs to be careful while invoking such ideas that may relate to people’s sacred and social beliefs in attempting to provide ‘scientific’ explanations to them. Moving towards scientific thinking would involve providing alternate explanations and allowing traditional tenets to become less sacred as they lose their absolute validity, through an accompanying loosening of social structures that sustain such tenets (Rampal, 1994; Ogunniyi, 1988, 1989).

This issue has repeatedly troubled and creatively engaged colleagues and friends during our work in the literacy campaign and as part of the activities of the All India People’s Science Network. For instance, during the total solar eclipse in 1994, thousands of literacy activists in the country had conducted a special ‘Cosmic Voyage’, and travelling cultural troupes had moved across the country communicating with millions of people and mobilising them to watch and learn about the phenomenon. Poems and plays were specially written and printed in books that indicated how to incorporate people’s own beliefs and legends, while presenting new knowledge. The play *Grahan men bhi Surya Sundar* (The sun is beautiful during the eclipse too) used folk humour and satire to portray popular beliefs and rituals related to the eclipse, while also trying to motivate them to see the spectacular event, and accept other explanations for its incidence. Dismissing traditional beliefs cursorily, without addressing how past civilisations have sought explanatory metaphors for such natural occurrences, can be counter-productive. It alienates and gives the unnecessary impression that science is too ‘impersonal’ and opposed to all that they may hold dear or sacred.

Conclusion

This chapter has highlighted the gulf between the indigenous knowledge learners have about math and science and the formal, distancing and often incomprehensible

ways in which school textbooks are presented. On the other hand, while working with unschooled youth and adults engaged in a craft we can see how their knowledge is situated in practice (Rogoff & Lave, 1984; Lave, 1996) and is based on high levels of innovation, creativity and resourcefulness. I am reminded of a young watch mechanic I had gone to (in the small town where I once lived) with a very inexpensive (and perhaps disposable) watch that had stopped functioning. He handed it back the next day, ticking away, and charged only a pittance of 10 rupees (roughly 20 cents) saying, with visible pride “I have learnt from my father that my job is to make it work, not throw it away!” This sentiment is integral to the ethics of his unschooled knowledge. It has its roots in the system of learning he experienced during his apprenticeship with his *ustaad* or master, who happens to be his father. It is such resourcefulness and innovation of ‘making things work’, with austerity and minimum expendable resources, often through creative recycling, which is the hallmark of this system of education. Moreover, such ‘learning while doing’ is premised on greater participation and collective effort, where thought, action and feelings are organically linked (Rampal, 2003a). Our schools could learn much from such systems of unschooled knowledge. These could serve to scaffold a counter-hegemonic discourse against globalisation. Indeed, what could be a better way to resist globalised consumerism than to take pride in making things work without expending resources or throwing anything away!

It is a matter of concern that in low-income countries like India ‘vocational’ education remains the least sought after, perceived as meant for the non-academic ‘backward learners’, even while working-class families despair that schools alienate their children from their own vocations and livelihoods. More often, institutes or polytechnics that offer such courses are not creatively or academically engaged with education, and are even placed under the Labour Department. In the present globalizing discourse of ‘brain vs body’ skills, where ‘creative twenty-first century skills’ are competitively sought for schools in industrialised countries, almost justifying the outsourcing of ‘low-skill’ jobs to low-income countries, there lies an urgent challenge to design indigenous vocational curricula with an innovative and academic ‘high skill’ edge for the majority. Moreover, as Brown, Lauder and Ashton (forthcoming) argue, the dominant discourse on education and globalisation needs to be challenged to show “that Britain and the US are not knowledge economies, where the value of knowledge continues to rise, but are characterised by an economy of knowledge that is transforming the relationship between education, jobs and rewards”.

There is a Zimbabwean proverb (Brock-Utne, 2002) which goes: ‘*Stories of the hunt will be stories of glory until the day when animals have their own historians.*’ Stories of our civilisational knowledge need to be told by historians of oral and indigenous knowledge using our languages that cradle our cognitive heritage and script our aspirations.

HUMAN RIGHTS AND THE LIMITATIONS OF RELEASING SUBALTERN VOICES IN A POST-APARTHEID SOUTH AFRICA

Nazir Carrim

Postcoloniality and the achievement of human rights in South Africa mark the transition to a post-apartheid society. The denial and violation of human rights of particularly “black”¹ South Africans under apartheid has placed the provision and protection of human rights centrally in the definition of a post-apartheid, “new” South Africa. Policy and administrative changes in education underscore this. The Preamble of the Constitution of the Republic of South Africa reads as follows:

We, the people of South Africa,
 Recognise the injustices of our past;
 Honour those who suffered for justice and freedom in our land;
 Respect those who have worked to build and develop our country; and
 Believe that South Africa belongs to all who live in it, united in our diversity.
 We, therefore, through our freely elected representatives, adopt this Constitution
 as the supreme law of the Republic so as to –
 Heal the divisions of the past and establish a society based on democratic values,
 social justice and fundamental human rights;
 Lay the foundations for a democratic and open society in which government is based
 on the will of the people and every citizen is equally protected by the law;
 Improve the quality of life of all citizens and free the potential of each person; and
 Build a united and democratic South Africa able to take its rightful place as a
 sovereign state in the family of nations.
 May God protect our people.
 Nkosi Sikelel’ iAfrica. Morena boloka stejhaba sa heso.
 God seen Suid-Afrika. God bless South Africa.
 Mudzimu fhatutshedza Afurika. Hosi Katekisa Afrika (South Africa, 1996a).

The Constitution explicitly notes the historical context within which it emerged and the ways in which issues of the past are to be addressed in the future development of democracy. It notes that it replaces what existed under apartheid and attempts to “heal the divisions of the past”. In order to do so, it “recognises the injustices of our past” and “honour(s) those who suffered” and all those who have contributed to “build(ing)” and “develop(ing)” South Africa. The Constitution and the changes in education in

South Africa established to give it effect cannot be understood outside of the historical context and legacies of apartheid. Its purpose is to (re)address the “injustices” and “divisions” of apartheid and to “lay the foundations of a democratic and open society” which were delegitimated and repressed under apartheid.

The recognition of “black” South Africans as citizens, on the basis of equality of all before the law, altered the political landscape and restored the “dignity” of all South Africans. It also provided the basis for “black” people to enter the political system, be members of parliaments, and become president of the country. The official abolition of apartheid signalled by the 27 April 1994 elections, is not only of titular and symbolic importance but was critical to altering materially the positioning of “black” South Africans in the polity. South Africa was welcomed back into the community of democratic nations of the world because of this historic accomplishment. Recognition in and by the law thus can effect material changes in people’s lives. This cannot be underestimated or undermined.

However, my focus in this chapter is the extent to which such recognition of human rights of all South Africans in and by the law, allows for the release of the voices of the “subaltern”. In the first section I draw on some precepts of the work of Gayatri Spivak and Walter D. Mignolo to outline the ways in which I use postcolonial theorising. I am concerned with exploring the extent of the achievement of human rights and democracy in post-apartheid South Africa. However, this is continuous with modernity and, as such, limits the extent to which “subaltern” voices are released. In the second section I outline some of the limitations of the discourse of human rights and show that, despite these limitations it did (and still does) play an important role in resistances to apartheid and the ways in which ordinary South Africans are able to defend themselves in the face of human rights violations. I draw on empirical data documenting experiences of pupils in schools regarding sexual orientation.

My primary purpose in focusing on sexual orientation is because the new South African Constitution recognises sexual orientation as a human right and is among the few constitutions in the world that does so. Article 9 of the Bill of Rights, states:

The state may not discriminate directly or indirectly against anyone on one or more grounds, including race, gender, sex, pregnancy, marital status, ethnic or social origin, sexual orientation, age, disability, religion, conscience, belief, culture, language and birth. (South Africa, 1996b)

In 2006, South Africa passed laws recognising civil unions among same sex partners, and became among the few countries in the world to have done so as sexual orientation tends to be unspoken in most contexts. Gays and lesbians occupy marginalised spaces in virtually all societies which are powerfully controlled by heterosexuality. Looking at sexual orientation provides a useful way to assess the extent to which the provision of human rights in post-apartheid South Africa reaches people on the margins of this heterosexual hegemonic order. In this chapter I tease out some of the implications for education of human rights, the construction of a post-apartheid South Africa, the postcolonial imagination and subalternity.

Can the Subaltern Speak?

In the essay “Can the Subaltern Speak”, from which this section borrows its title, Gayatri Spivak (1993) explores hegemonic ideas concerning aspects of the subaltern condition. The essay is a very complex and sophisticated analysis of the ways in which the “West” is constructed as the “Subject” and how “Others” are positioned and constructed as “Subjects” of the West. In the essay Spivak enters into a conversation with Deleuze and Foucault, including several references to Marx, Guattari, Gramsci and Edward Said in particular, before using Derrida in her thought-provoking deconstruction of “sati” or “suttee” – that is, Indian widows’ self-immolation on the pyre of their deceased husbands.

Spivak’s argument is that the voices of the subaltern – by which she means colonised peoples – cannot simply be about “releasing” “their” voices so that they can “speak for themselves”. This she sees as a tendency within some types of subaltern studies published in the USA to ignore the “macrological” constraints and conditions which position people. Such “micrological” studies, she argues, focus on personal experiences in decontextualised and individualistic ways and ignore the wider power matrices that construct our worlds on social, economic and political levels, and have global and historical dimensions. Micrological studies which do not chart such personal experiences in relation to wider socio-economic, political and historical forces can provide only partial accounts. Spivak’s point is that there ought to be an “articulation” (Hall, 1996) between the “micrological” and “macrological”, that is, studies which focus on social, economic and political power within global and historical contexts. Analyses need to consider not only the positionalities and experiences of the “subaltern” but of social phenomena in general.

In asking the question, can the subaltern speak, Spivak is at pains to show that for the subaltern to speak the very bases of the knowledge systems and subject positions need to be reconfigured. In looking at whether “the Indian woman”, as “subaltern”, can speak, through the experiences of “sati”, Spivak shows that first the Indian woman needs to be deconstructed. She needs to be seen as a Subject in relation to the legitimated and dominant concepts of the imperialist and imperialising West. She also should not be seen as the Other assimilated within colonising frameworks. Thus, she needs to be seen in her own terms. Spivak’s deconstruction of the Indian woman and “sati” entails examining Hindu terms and ancient, sacred Indian texts. These reveal that the woman remains subordinate to the Indian male, with such subordination inscribed on her body, particularly her genitalia. Spivak concludes that despite deconstruction the subaltern still cannot speak. She cannot speak in the grammar of the West, she cannot speak in the chauvinism of the Hindu male, she cannot speak in the scriptures of the pious Brahmin and she cannot speak in the heavens. Not until she disembodies herself from her female body, destroys herself and is no longer woman, that is only in the utter annihilation of her as woman can she speak and be heard. As long as she is woman and subaltern she cannot speak.

Spivak’s analysis of subalternity points to two significant factors that are of critical importance to an analysis of a postcolonial and post-apartheid South Africa. First, Spivak allows us to see that the voices of the subaltern can be heard only once he or

she has been assimilated as the Subject of the West. But this is speaking in “his Master’s voice”. For South Africa this implies that the establishment of human rights in the “new” South Africa through current constitutional provisions is continuous with what the West can “hear”. The ‘new South Africa’ is spoken in the language and grammar of the West. Spivak alerts us that even if one uncovers indigenous knowledge systems this does not necessarily mean that the voices of the subaltern can or will be released.

Walter D. Mignolo (2000), in commenting on the subaltern dilemma refers to “border thinking” or “an other thinking” and a “double critique” which characterise analyses of subalternity. He points to some of the points of tension in postcolonial (and post-modern) ways of thinking and the challenges that confront them. He says that “border thinking structures itself on a double consciousness, a double critique operating on the imaginary of the modern/colonial world system, or modernity/coloniality” (Mignolo, 2000). Thus “subaltern reason” is able to:

open up the countermodern as a place of contention from the very inception of Western expansion making it possible to contest the intellectual space of modernity and the inscription of a world order in which West and the East, the Same and the Other, the Civilized and the Barbarian were inscribed as natural entities” (Mignolo, 2000, p. 96).

Mignolo’s argument is thus that the subaltern condition is not fixed, but is always in a state of flux, presenting the potential of counter-hegemonic ideas. But this potential will always be constrained by global conditions.

“Border thinking” or “double critique” is similar to and an elaboration of Spivak’s “macrological” and “micrological” forms of analysis. “Double critique” and “border thinking” are about understanding the personal experiences of people and deconstructing them with regard to how they are positioned within modernity and “the intellectual space” of the West. It simultaneously allows for the “stories” of the “subaltern” to be told “in their own voices” and not as inscriptions of Subjects of the West. To further expand on this point consider the following in relation to the category of “race”. People may be classified as “black”. It does not mean that they in fact are ‘black’ genetically or historically. Following “border thinking” and a “double critique” one needs to understand the ways in which the category “race” (and all of its significations) is constitutive of “the modern/colonial imaginary”, and to explore the experiences of people categorised as “black” in their own terms and “in their own voices”. However, one also needs to understand that the “own voices” of “black” people, once released, may not necessarily be “countermodern” because they too may be informed and constructed within the ideological constructions of other power matrices which would not necessarily release the “voices of the subaltern” but in fact rearticulate them in the terms of another hegemonic construction.

In employing this type of double critique, with a double consciousness, a border thinking analysis of post-apartheid South Africa has to question to what extent and in which ways it colludes with modernity and the world order. It would be too easy to employ what Spivak’s calls a “micrological” analysis and celebrate the achievement of democracy and human rights in the abolition of apartheid in South Africa, and, thereby ignore the “macrological” interconnections between this process and the global political economy and knowledge systems.

Why has a post-apartheid South Africa been so welcomed by the Subject of the West? Drawing on Chakrabarty, Mignolo states:

One can only articulate subaltern subject positions in the name of history – (the discourse of which has Europe as sovereign, theoretical subject of all histories. (Mignolo, 2000, p. 203)

In many ways this captures some of the reasons why the achievement of democracy in post-apartheid South Africa has been welcomed by the West and Europe. The abolition of apartheid was a necessary event in the globalisation of democracy and the establishment of a culture of human rights among the colonised. Many have also pointed out that these are the ideological conditions for a global political economy which requires the development of modernity in colonised countries (Castells, 2001; Žizek, 2005). Apartheid was not in keeping with the trajectory of global capitalism and could not hold within its framework a modernist socio-economic and political project (Wolpe, 1986). The post-apartheid, postcolonial South Africa is a modernist project and it is precisely for this reason that Derrida, for example, regards Mandela as the “last of modernist prophets” (Derrida, 1986). Post-apartheid South Africa has been applauded by the West and Europe. Politically this is demonstrated by the fact that South Africa now (as of October 2006) enjoys “non-permanent member status” in the UN Security Council. Culturally the status of post-apartheid South Africa is evident in instances such as its selection to host the World Cup Soccer in 2010, its winning the Oscar awards for the best foreign film (*Tsotsi*) and a Grammy award for the Soweto Gospel Choir. On global economic, political and cultural levels, then, a post-apartheid, postcolonial South Africa is very much “at home” as the Subject of the West.

In the following I use this framework provided by Spivak and Mignolo to show that “subaltern” voices in South Africa speaking from education settings are both enabled and constrained within current conditions. In pursuing this argument I indicate that the discourse of human rights is contradictory, but this contradiction is by no means negative. It is constitutive and constructive, but it is limiting and limited. My point in this argument is to demonstrate that whilst “subaltern” voices may be argued to be released in the post-apartheid, postcolonial moment, the “subaltern” in fact still cannot speak. Subaltern expressions are instead being re-articulated in the imaginary of the West and are being projected, positioned and received in the name of the West. My entrée into this is via a discussion on the framing of human rights in South Africa and the ways in which gays and lesbians express in their “own voices” rights with regard to sexual orientation and schooling in the “new” South African dispensation.

Using Human Rights to Achieve Democracy in South Africa

The discourse of human rights is at once empowering and limiting. It is empowering because it accords formal equality to all people in the world. But it is limiting because of its point of origin and discursive framework. There are several critiques of the discourse of human rights. These range from early critiques of Marx and Bentham in relation to the *The Declaration of the Rights of Man and the Citizen*, to critiques of the

United Nations *Universal Declaration of Human Rights* (1948) which led to the adoption of the *African Charter of Human and People's Rights* (1981). My purpose here is not so much to review the criticisms of the discourse of human rights, but to point to some of the central points in these critiques in order to demonstrate that the discourse of human rights is not unproblematic and should be treated critically. However, as pointed above, I also intend to show that the discourse of human rights does at the same time provide enabling conditions for countering forms of oppression.

The discourse of human rights came to international prominence through the proclamation of the *Universal Declaration of Human Rights* in 1948 by the United Nations. Prior to the *Universal Declaration of Human Rights Declaration of the American (USA) Independence* of July, 1776, the *Virginia (USA) Declaration of Rights* of June, 1776 and the *Declaration of the Rights of Man and the Citizen* of 1789 during the French Revolution all contained formulations regarding human rights (Osler & Starkey, 1996; Touraine, 1997; Weston, 2002). This discourse has been criticised for “misrecognising” and “nonrecognising” (Taylor, 1994) the particularities of the people of Africa and other colonised peoples of the world. By “misrecognition” Taylor refers to a “demeaning, oppressive” and inferiorised positioning of the “other” by a dominant, and dominating, Subject. “Nonrecognition” entails an almost complete ignoring and denial of the “presence” of the “other”, as if “they” are not even there.

In the imaginary of the modern world system is that in the declaration of the “rights of man and the citizen” the colonial question has vanished; consequently the concept of man and of the citizen universalized a regional issue and erased the colonial question. (Mignolo, 2000, p. 62)

Mignolo’s comment above raises a critical issue that is of importance to Africa, and South Africa in particular. The “erasure” of the “colonial question” within the establishment and origins of human rights is most visible when one takes into account the fact that when the French *Declaration of the Rights of Man and the Citizen* of 1789 was proclaimed, the French continued with colonising “other” countries on the African continent. When the *Virginia (USA) Declaration of Rights* of June, 1776 was declared Native Americans were having their lands taken away from them in order to consolidate the USA (Squadrito, 2002; Goldberg, 2002). The “erasure” of the “colonial question” in the *Universal Declaration of Human Rights* of the United Nations is most stark in the experience of apartheid in South Africa. The *Universal Declaration of Human Rights* of the United Nations was promulgated in 1948, the year the racist, white supremacist, apartheid regime established itself in South Africa. Thus, whilst Europe and the West were heralding the importance of human rights and projecting them as if they were universal, in colonised countries, like South Africa, human rights were in fact being violated and inhuman and degrading conditions were being consolidated. This process was supported actively by the governments of the countries that were, at the same time, proclaiming human rights as a “standard” for “all the peoples of the world”. Derrida comments on this:

For one must not forget that, although racial segregation didn’t wait for the name *apartheid* to come along, that name became the order’s watchword and won its

title in the political code of South Africa only at the end of the Second World War. At a time when all racisms on the face of the earth were condemned, it was in the world's face that the National Party dared to campaign "for separate development of each race in the geographic zone assigned to it" (Derrida, 1986, pp. 330–331).

Thus, whilst the discourse of human rights was projected as "universal" by the West, countries on the African continent were still caught in the yokes of colonialism that entailed blatant violations of human rights by people of the West. These are some of the reasons that provided the impetus for the establishment of the *African Charter of Human and Peoples' Rights*, which was adopted by the Organisation of African Unity (now the African Union) in 1981. This came into force in 1986 (Weston, 2002).

The United Nations *Universal Declaration of Human Rights* was seen by many in Africa as a Western and European document. It was framed with European and Western contexts in mind and recognised in its early history Western and European people, their views and experiences. The *Universal Declaration of Human Rights* seems not to recognise Africa and African experiences. It seems to be silent on the economic, political and sociocultural power differentials constitutive of colonialism. It is the knowledge systems of the West that are legitimated. Colonised world views are not articulated. Subjugated, colonised people are invisible and hence inferior. Colonised countries, it is implied, are available to imperialism and their wealth can be extracted by the West.

As such, the pretence at universalism within the *Universal Declaration of Human Rights* is decidedly "monological" (Taylor, 1994), in character. In Taylor's terms "monologues" are conversations one has with one's self and/or with others who are like oneself. Colonisers had conversations about the colonised with and among themselves, not in a "dialogue" with the colonised at all. For Taylor, such "monologues" are fundamentally informed by "misrecognition" of the "other". It is misrecognition because the image of the "other" is constructed by the Same in the terms of the Same, so that the Same can be assumed to be better than and superior to the "other", thereby inferiorising and subalternising the "other" in order to ideologically justify and consolidate the project of colonialism. In this light, the *Universal Declaration of Human Rights* does not "speak to" the experiences of the colonised "other" and thus, in Mignonolo's terms, "erases" the "colonial question". The *Universal Declaration of Human Rights* was, in its own terms, a response to the atrocities experienced during the Second World War in the West and Europe! The aspirational response was framed as 'universal' even though it was the outcome of a very particular group of diplomats and the countries they represented.

Debates about the extent to which human rights are applicable to the African continent have dealt with three themes. Firstly, conditions in Africa which are characterised by extreme poverty, disease and underdevelopment – all of which are also argued to be consequences of colonialism – imply that human rights in Africa have to focus on issues of development in order to eradicate poverty and disease, as opposed to individual civil and political rights (Ambrose, 1995). Secondly, due to colonialism, human rights in Africa are tied centrally to developing independent nations, which require far more state intervention than is often acceptable in Europe or North America (Nanda *et al.*, 1981). Thirdly, indigenous African cultures do not fit neatly within a human rights paradigm and often contradict, if not violate, human rights (Abdullah, 2000).

These critiques point to the need to acknowledge the specificities of the conditions and cultures of the continent and its people. They suggest implicitly, and at times explicitly, that the “universalism” in the *Universal Declaration of Human Rights* cannot be uncritically accepted to mean that the conditions and ways of being of Africans are acknowledged within it. In fact, their arguments show that the “universalism” of the *Universal Declaration of Human Rights* is not significantly inclusive of African realities and needs to be adapted to fit into African contexts and lives.

Apart from the misrecognition and non-recognition of African people and their realities, the *Universal Declaration of Human Rights* has also been criticised for its “silence” on the experiences of women (MacKinnon, 1993). Looking specifically at the experiences of women during the war in the former Yugoslavia, Mackinnon shows that the *Universal Declaration of Human Rights* not only ignored the violation of women and their rights during this war but that the discourse of human rights is framed in the image of and speaks to the realities and experiences of men. It is decidedly masculinist. Thus, in respect to “race”, gender and class the discourse of human rights cannot be assumed to enable people to counter the forms of domination they experience.

Given the above discussion, it is evident that a mere legalistic treatment of human rights in South African school curricula would be both inadequate and insufficient. A legalistic treatment of human rights would simply make pupils aware of what the laws state, and cover the human rights provisions in the *South African Constitution* and the *United Nations Universal Declaration of Human Rights* and similar human rights instruments. However, as the above discussion shows, human rights are contested and contestable which implies that they cannot be treated as if they are abstract, given truths. Simply teaching the law, as it were, would be inadequate to capture the contestations that have marked the developments of, and in, the discourse of human rights. A legalistic treatment of human rights would not, in itself, outline what the specific implications of such human rights provisions are in the particular contexts of people’s lives. The teaching of human rights in education, thus, needs to explore the contested and contestable nature of human rights, and engage with their implications in the actual lives of people. Otherwise, they will simply be legalistic abstractions which do not speak to the conditions of people’s existence.

The discourse of human rights has played a significant role in the resistance to apartheid and the establishment of democracy in South Africa. Many have argued that the claims of human rights and of equality of all people played a significant role in anti-colonial struggles by providing a basis to oppose the monological impositions and inequalities of colonialism. At the 50th anniversary of the United Nations *Universal Declaration of Human Rights* in 1998, South African constitutional judge Albie Sachs said:

Twenty years [after the Proclamation of the Universal Declaration], I am in exile ... I am using the text of the *Declaration* to prove that my country is the worst in the world ... I go through the *Articles* one by one and show how law and policy in South Africa violates them all (Sachs, 1998).

Sachs, like many in the anti-apartheid movement, used the *Universal Declaration of Human Rights* to show how unjust apartheid was and how it was a blatant violation of

human rights. Mandela (1964) stood up in an apartheid court and argued against racism as a violation of human rights using the *Universal Declaration of Human Rights*. Mandela said:

As your Worship pleases. I was developing the point that a judiciary controlled entirely by whites and enforcing laws enacted by a white parliament in which we have no representation, laws which in most cases are passed in the face of unanimous opposition from Africans, cannot be regarded as an impartial tribunal in a political trial where an African stands as an accused.

The Universal Declaration of Human Rights provides that all men are equal before the law, and are entitled without any discrimination to equal protection of the law. In May 1951, Dr. D. F. Malan, then Prime Minister, told the Union parliament that this provision of the Declaration applies in this country. ... But the real truth is that there is in fact no equality before the law whatsoever as far as our people are concerned, and statements to the contrary are definitely incorrect and misleading.

It is true that an African who is charged in a court of law enjoys, on the surface, the same rights and privileges as an accused who is white in so far as the conduct of this trial is concerned. He is governed by the same rules of procedure and evidence as apply to a white accused. But it would be grossly inaccurate to conclude from this fact that an African consequently enjoys equality before the law.

In its proper meaning equality before the law means the right to participate in the making of the laws by which one is governed, a constitution which guarantees democratic rights to all sections of the population, the right to approach the court for protection or relief in the case of the violation of rights guaranteed in the constitution, and the right to take part in the administration of justice as judges, magistrates, attorneys-general, law advisers and similar positions.

In the absence of these safeguards the phrase 'equality before the law', in so far as it is intended to apply to us, is meaningless and misleading. All the rights and privileges to which I have referred are monopolised by whites, and we enjoy none of them.

The white man makes all the laws, he drags us before his courts and accuses us, and he sits in judgement over us. ... I feel oppressed by the atmosphere of white domination that lurks all around in this courtroom. Somehow this atmosphere calls to mind the inhuman injustices caused to my people outside this courtroom by this same white domination (Mandela, 1962, lines 40–63).

In the above lies the distinction that is Mandela's – his confrontation of the law with a law about the law. The irony and paradox in this is, nonetheless, unnoticed by Mandela. Indeed his call for "recognition" by the law of himself, of lawyers, of "black" people and of "justice" alerts us to a framing of laws that was decidedly racist. As much as MacKinnon (1993) pointed to the masculinism of the framing of human rights, Mandela points to their racist frame when utilised in South Africa without an acknowledgement of the conditions of the majority of the

population. As Mandela puts it, “whites” are “interested parties” and the law was constructed in order to serve “their interests”. Herein, then, one notices the simultaneous “recognition” of “whites” by and in the law, and the “non-recognition” and “misrecognition” of “black” people by and in the law. Mandela’s presence in the courts, and his statements, demonstrated this powerfully. Mandela was able to do this by recourse to the discourse of human rights, drawing on this to express ideas on which systems of justice ought to be based. In the above he refers directly to the *United Nations Universal Declaration of Human Rights*. He forced recognition of his absence in the law by his presence before the law.

This effect of the discourse of human rights as an enabling factor in people’s defense of themselves appears to continue in post-apartheid South Africa and is evident in the way young gay learners negotiated their positions in school. This is evident from a study that looked at understandings and experiences of human rights, democracy and citizenship among Grade 9 learners and teachers in schools in the Western Cape, Gauteng and KwaZulu-Natal.² Dion (fictitious name) is a gay learner in a school in the Western Cape. One Monday morning, Dion arrived at school with his hair dyed “shocking orange”, and went around saying “I am not scared anymore. I am what I am and I am proud”. Dion “outed” himself. His orange hair was a symbol of him being unapologetic about being gay. In the interview transcripts this comes through explicitly:

I: Tell me about the orange hair.

Dion: I just had enough you know, and I said I am tired of being afraid all the time and I am just going to be myself no matter what it takes.

I: What were you afraid of?

Dion: As you know our school is filled with gangs and they always threaten to rape me and insult me, laugh at me and, Here (“My God”), harass me all the time. I was just gatvol (“sick and tired”) of this and said, you know, how long must I walk around feeling scared. So, I decided to dye my hair orange to show them that I am not afraid and I am proud to be gay and who I am. I am here to stay.

I: How did they react?

Dion: Now they think I am just crazy, you know, like mad. But they got the message. I told this guy, the big shot in the gang, I am here to stay and he better get used to that, I have my rights, and he just looked at me completely shocked. Ooo ... (*giggles*) I just loved it.

I: So, has the harassment stopped?

Dion: Yes, but they still make comments, but it is not as bad as it was because they know that now I will stand up for myself and I won’t take any shit from them anymore.

Dion refers to his rights which he now enjoys and uses them in order to assert his identity and presence.

Another gay learner, Tulani (fictitious name) is a learner in a school in Gauteng and drew on ideas about human rights to discuss how he was treated.

- I:** Do you experience any discrimination in the township now?
Tulani: Not really, but I am out and I won't stand for it.
I: What would you do?
Tulani: Harw? I have my rights now, they can't do what they want to do like before. Now I can take them to the police and they are "bang" (scared).
I: Would you do that, I mean would you take them to the police?
Tulani: Of course, I have my rights, I am like they are and if they do something to me that is like really bad, I will take them.
I: Have you reported anybody to the police so far?
Tulani: No I haven't.

Tulani explicitly refers to his "rights" in defense of himself, and views instruments of the law – "the police" – as "now" being there for the protection of his rights. Tulani views these rights as establishing equality between him and others – "I am like they are". He also views this as being different from the past. The perceived increased acceptance among community members has to be also seen in the light of greater confidence and assertion on the part of Tulani, as well as the existence of formal equality provisions which recognise sexual orientation as a human right, to which both Tulani and Dion refer.

Thus for Dion and Tulani, the discourse of human rights as enshrined formally in the "new" South African Constitution seems to enable them to assert their identities positively and defend themselves as being equal to others. I have deliberately chosen to focus on Dion and Tulani, because as gay learners they indicate a marginalised and generally invisible sector of society. In their marginalised spaces, however, the discourse of human rights which in this case explicitly recognises their rights to a sexual orientation of their choice seems to have a direct effect on them viewing themselves positively and asserting their rights to be themselves in the face of "others".

Thus, whilst there is a need to treat the discourse of human rights critically and to be mindful of Western and European constructs in its history, it has played a significant role in resistances to apartheid and continues to have positive effects in the post-apartheid situation as the examples above show. This has a direct implication for education in many countries. Whilst the discourse of human rights needs to be treated critically when it is taught and its contested nature needs to be engaged with explicitly, this does not mean that teachers should not ensure that learners understand the law and their human rights. People need to know what human rights are. They need to know what is contained in Constitutions and laws of countries and what international human rights instruments are. These still remain "necessary knowledge" (Osler & Starkey, 1996). Rights do not exist outside laws, and people need to know these laws in order to know their rights.

However, I am arguing that whilst the legalistic understandings of human rights may be necessary, they are by no means sufficient. For human rights to be viewed as meaningful in relation to the wide range of human experiences which embrace powerful, silencing processes, one needs to also ensure that the teaching of human rights acknowledges these contexts. Human rights education needs to "speak to" people's own experiences in the form of articulation of macrological and micrological language

Spivak suggested or Mignolo's "double critique". Such an approach to human rights education has tremendous potential. It would thus:

1. Provide learners with the "necessary knowledge" of human rights in legalistic terms
2. Expose learners to the historical development of the discourse of human rights
3. Equip learners with an understanding of the ways in which human rights have been, and are, debated
4. Enable learners to access some of the ways in which the discourse of human rights is framed rather than treat it as if it is pre-given and unconstructed
5. Allow for an exploration of what human rights mean in the context of people's own lives thus enabling human rights education to "speak to" people's own experiences

Nonetheless, the discourse of human rights in South Africa is linked inextricably to the project of modernity that the post-apartheid formation establishes with its consolidation of democracy in South Africa. The possibilities of releasing "subaltern" voices within such a modernist project cannot be taken for granted. The abolition of apartheid and the provision for sexual orientation in terms of human rights in the new South African Constitution signify South Africa's assimilation within, rather than opposition to, the Subject of the West and Europe. But, as Mignolo points out this is not unique. In developing the differences between "exterior subalternity" and "interior subalternity" he states:

This difference allows us to understand that gender, ethnic and sexual differences could be absorbed by the system and placed in the sphere of interior subalternity. This is visible today in the United States as far as Afro-Americans, women, Hispanics, and queers (although with sensible differences between these groups) are becoming accepted within the system as *lo otoro*, complementary of the totality controlled by "the same". (Mignolo, 2000, p. 176)

Thus, as is indeed the case, South Africa upholds its "exterior subalternity" by arguing that its presence on the UN Security Council and its hosting of the Soccer World Cup are "for the continent of Africa". However, in its assimilation within the global political and economic order it displays its "interior subalternity" as it becomes "accepted within the system as *lo otoro*, complementary of the totality controlled by the same".

In the instance of recognition of sexual orientation as a human right the passing of the Civil Union Act points to significant features of "interior subalternity". In the debates and public discussions around the passing of the Civil Union Act it became clear that whilst the South African Constitution recognises sexual orientation as human right, this does not necessarily imply that gays and lesbians would be able to be "married". It became clear that "marriage" remains framed within traditional conceptions of marriage as a heterosexual union between a man and woman, and that it is underpinned by a "divine" recognition of such a union being ordained by God. This includes dominant religions as well as indigenous belief systems. As such, partnerships between people of the same sex may be considered as "civil unions" but not as marriages, causing seri-

ous discontent among the gay and lesbian community in South Africa (*Exit*, October 2006). Thus, as is the case with “sati” which Spivak looked at, gays and lesbians are recognised only to the extent to which they can be assimilated within the frame of modernity, which remains heterosexist. Its discursive frame, in this instance, is continuous with indigenous knowledges and dominant religions. In this regard, whilst gays and lesbians do enjoy considerable status politically, economically and socially within the post-apartheid, postcolonial South Africa, they remain subalternised and cannot “speak” before God, in indigenous and traditional knowledge systems, and are ensured to only exist and speak within modernist hegemony as *lo otoro*.

The situation however is extremely complex. The South African government argues that the development of modernity in South Africa and Africa in general are necessary conditions for an effective challenge to global hegemony. It also contends that its presence within the Subject of the West is necessary for it to put the voices of the subaltern at the feet of power and redefine the world order. In this regard, one could argue that becoming *lo otoro* may be a strategic necessity and not necessarily an assimilation within the West. However, such arguments tend to underestimate the power of the forces at work within the global political economy and assume that by merely putting the subaltern on the global agenda power matrices can be reconfigured. It is useful to keep in mind, as Mignolo puts it, using Das, that, “the ‘subaltern’ is not a category but a perspective; and that the subaltern perspective is not engaged in understanding such and such social organisation or social actions per se but in understanding its ‘contractual’ relations under colonial rules and the ‘forms of domination belonging to the structures of modernity’” (Mignolo, 2000, p. 188).

I am not suggesting here that South Africa’s role and presence on the global stage is insignificant. Rather, what I am pointing to is that South Africa’s re-entry into the world order is part of a modernist project and that this does not necessarily mean that it is counter-hegemonic or would enable the release of subaltern voices. In all likelihood its insertion in the world order will limit the possibilities for “an other thinking” since modern conceptions of reason and rationality and power configurations of the global political economy subalternise “the other” in order to constitute itself. In other words, South Africa in its post-apartheid and postcolonial form participates in the world order; it does not reconfigure it. In this regard, the experiences of Dion and Tulani in asserting their rights at school are also limited in their counter-modern potential. The assertions of sexual orientation rights by Dion and Tulani are *lo otoro*, within the “totality of the (modernist) Same” and marks their “interior subalternity”. Positioned as “subalterns”, Tulani and Dion still cannot speak, just like Indian women in Spivak’s analysis of “sati”

Drawing on the complexity of subaltern positions, this chapter has suggested that education of (and for) human rights needs to firstly ensure that the legalistic nature of the discourse of human rights is covered; but at the same time the discourse of human rights needs to be presented as contested and is contestable. This suggests that the teaching of human rights needs to promote a critical exploration of human rights, rather than teaching them as dogma and uncontested truth. Lastly, the teaching of human rights needs to allow for an exploration of their articulation of “interior” and “exterior subalternity”, noting their “micrological” and “macrological” links with global and national orders.

This suggests that schools teaching for nation building, which arguably is important for social cohesion, cannot deal with human rights in ways that are narrowly nationalistic and parochial. As the examples show, schools need to locate their societies within wider global settings.

My purpose in this chapter has been to use a “double critique” associated with subaltern studies in order to understand the transition from apartheid to democracy in South Africa. I have done so by first viewing the achievement of democracy in post-apartheid, postcolonial South Africa from the perspective of human rights and noted the contradictory ways in which the discourse of human rights enabled resistance to apartheid and continues to exert positive effects on the lives of young, in this instance, gay pupils in schools. I have, however, also shown that rather than celebrating the human rights “victories” which a “micrological” analysis of post-apartheid South Africa may be prone to do, it is important to place South Africa within the context of a global political economy. At this post-apartheid and postcolonial moment South Africa is presently an actor on the stage of the world order. But rather than reconfiguring the hegemony of the global order it is inserted within it as an important and significant actor. This insertion, I have argued, is part of the consolidation of modernity, which the post-apartheid South Africa represents. This representation, however, is not necessarily a condition for the release of subaltern voices through educational and cultural practices but places limitations on the authenticity and possibilities of their expression. Throughout, I have tried to show how both in the resistance to apartheid and in the post-apartheid situation the discourse of human rights and the project of modernity are filled with contradictions. These contradictory forces at once constitute the modernity of the postcolonial South Africa and limit its transformative potential. Nonetheless, the contradictions are productive, not only because they are constitutive, but also because they bring to the fore the tensions and challenges that exist in order to exercise “border thinking” and counter the hegemonic global order and its knowledge systems.

Notes

1. The word “black” refers to people who were classified under apartheid as “Coloured”, “Indian” and “African” under the Population Registration Act. “Black”, thus, refers inclusively to all of these South Africans who were racially classified. Throughout this chapter I use references to racial classification of people in inverted commas to signal that they are apartheid racial classifications, and, more importantly to indicate that racial classifications are social constructions which I reject as valid descriptions of people within or outside of South Africa, under apartheid or in the present time. The terms, however, are used in this chapter in order to facilitate the narrative and for theoretical convenience.
2. This study was conducted between 1996 and 2000 and formed part of wider study (Carrim, 2006).

SOCIAL JUSTICE, DEVELOPMENT THEORY AND THE QUESTION OF EDUCATION

Elaine Unterhalter

Education holds a particular place for theorisations of development formulated since the 1950s. In changing conditions, marked initially by the political economy of the Cold War and decolonisation, and later by globalisation and the political realignments of the post-Cold War era, views on the aims for education, how to systematise school knowledge, organise pedagogy or view school management have been much contested. Particular development theories' assumptions, research methodologies and practices have emphasised certain aspects of education and de-emphasised others. But little attention has been given to views of justice (both implicit and explicit) and how these orient the dynamics of thinking about education and international development.

Six approaches to development theory are explored in this chapter in relation to the ways in which they conceptualise education and social justice. This is a partial selection as it is not possible to explore all the varieties and debates in development theory in one chapter. I have made the selection, partly because these approaches are evident in largely chronological waves from the 1950s and partly because they are those commonly discussed in general reviews of phases of contemporary development theory (Preston, 1996; Munck & O'Hearn, 1999; Rapley, 2002; Gasper, 2004). In discussing them I have tried to draw out how each locates the aims of education and the implications of these for practices advocated in relation to curriculum, pedagogy and management. I also attempt to distil in each approach assumptions about the nature of the person to be educated and the connection between education and social justice. I draw out some of the consequences of these formulations for the preferred forms of research associated with each theory. The consequences of the explanations these offer for global action on education and poverty is then assessed.

Modernisation Theory and Nation Building

Modernisation theory emerged in the 1950s and 1960s and expressed the view that the economic, political and social formations associated with Western Europe and North America were at a more evolved level of development than what were termed the 'traditional', non-modern or underdeveloped societies of the rest of the world. 'Modernity' was linked by Rostow (1959) with a market economy where investment and growth in a particular sector would lead to take-off, higher wages and increased consumption. David Apter identified modernity with democratic politics, where local affiliations and

practices of governance were replaced by institutional forms associated with political parties, elected parliaments, and efficient local government (Apter, 1965). Inkeles and Smith (1974) identified particular dispositions of a modern personality who was independent and rational.

These theorists suggested sharp and normatively inscribed distinctions between the world of modernity and that of tradition. The former, it was claimed, would deliver higher living standards, more efficient government and more rational forward-looking human subjects. The latter, it was claimed, was characterised by stagnant economies and poverty, corruption, inept government and backward-looking parochial subjects. In its ideal form at the centre of the theorisation of modernity stood a man, with all the attributes of a good subject. The relationships that were considered important to him were in the public sphere of politics or work. While he might have ties of affiliation to women, children, or community these were all at a second order of concern located in a private sphere, which might be problematically not modern or not modern enough.

A slightly different version of modernity, less overtly critical of certain forms of 'tradition' was being articulated by the architects of new nation states that were forming as decolonisation gathered pace from the late 1940s. Here modernity was associated with citizenship of the new states, a putting aside of affiliation based exclusively on one religion, language or region for commitment to a national project rooted in a Constitution, the establishment of key social institutions such as universities or a national radio or a planned economy. The establishment of an official language was often an important site of contestation for new nations. While many of the anti-colonial national movements that put in place this version of modernity had been actively supported by the mobilisation of women (Jayawardena, 1986; Stasiulis & Yuval Davis, 1995), the modern citizen envisaged tended to be considered gender-neutral; all it was claimed, were equal before the law and had equal opportunities in the new secular state (Rai, 2002).

These two intersecting appropriations of ideas of modernity were aligned with different social forces which sometimes made common cause. The first was linked with the expansion of American political and economic influence into areas once the sphere of European colonial powers (Ambrose & Brinkley, 1997). The second was associated with the complex politics of decolonisation (Chatterjee, 1991; Pieterse & Parekh, 1995; Hyam, 2007). But despite some significant differences these two perspectives on modernity have in common a limited capacity to acknowledge sufficiently, either analytically or in practice, the diverse contexts of citizenship, the ambiguities of understandings of modernity and the millions of people who did not have clear relationships of citizenship with nation states, either because they lived in regions that were inaccessible to modern institutions and forms of mass communication, or because they had been dispossessed of citizenship through war or a politics of exclusion. From the perspective of modernisation theory social relationships that did not fit with ideas of rational citizenship, employment in the wage economy, consumption, secularism, and national affiliation were portrayed as 'weighed down' by tradition, particularism and inefficiency. For democratic projects associated with new forms of state emerging, for example, in India or Ghana, there were intense struggles about how to articulate a popular vision that was inclusive enough.

The implications of this sharp binary were that the aims of education should include a process through which people could become modern and 'take off' the burdens of 'tradition'. In schools, technical institutes, adult literacy classes and universities they would learn the dispositions of citizenship, democracy and the importance of national economic growth. Education was thus a key process through which the transformation to modernity was to be achieved (Fagerlind & Saha, 1983). The new technologies associated with mass communication, for example, radio and then television, were seen as key instruments to achieve this (Lerner, 1958). The provision of mass schooling was an important component of the form of modernity associated with nation building. Mass schooling for all citizens was seen as necessary for economic growth and as an indication of commitment by new governments to social development for all the people (Carnoy & Samoff, 1990).

It was thus important that schools should teach those forms of knowledge associated with modernity, not available elsewhere. Literacy in the official language, understood in terms of the capacity to read and write a short statement with understanding, was considered best taught in schools to adults and children (Jones, 1990). Languages associated with nation building: Swahili or Hindi or Spanish were also seen as the particular remit of schools (Aikman, 1999; Mvungi, 1974). Practices of national affiliation, such as saluting the flag or learning about the provinces that made up the country of which children were citizens, were also emphasised (Uchendu, 1980; Harber, 1997). Numeracy was considered key to employment in the modern sectors of the economy where a science of measurement, numeric representation, and abstract deduction, were seen as important for efficiency, technological innovation and understanding of health (Eisemon, 1989). Thus, schools were key spaces for teaching subjects associated with modernisation.

The pedagogy that would support learning these subjects for these purposes was often termed transmission teaching, because its main concern was conveying the content of knowledge, not particularly responding to the ideas or contexts of the learners. Thus, for example, Eisemon, commenting on the teaching of science in African schools in the 1970s, suggested that it was not the length of time in school, but the nature of teaching, that is content and quality of instruction that would strengthen understanding (Eisemon, 1989). Adesina, reviewing changing approaches to the teaching of history in Nigeria, charts how in the 1960s emphasis initially was on instruction in the sequence of events in the 1960s (Adesina, 2006). The approach to school management associated with modernisation stressed rational bureaucracies with a central role assigned to Departments of Education located in capital cities with subordinate district or circuit offices reporting upwards. For example, in South Africa this system of education administration, duplicated for all the racially divided groups, was considered rational and efficient in relation to 'modern' ideas about national- and provincial-level organisational structures (Behr, 1966). When all education provision was unified under one Ministry of Education in Kenya at independence, the units for administration were designed in terms of what was seen as a rational national organisational structure (Raju, 1973).

The assumptions about the person in relation to the institutions of modernity were thus ideas about sameness and unity. All should be offered equal opportunities to access school and these new forms of knowledge.

Two ideas about justice are implicit within modernisation theory. The first is that justice is not a theory, but a set of efficient legal institutions. This understanding links together descriptive accounts of state authority with a normative account of the legitimacy of that authority (Hart, 1961) If laws in education are made by democratically elected bodies and interpreted by courts that are not corrupt, if revenue is collected efficiently and spent rationally on school provision as laid out in economic plans, then justice is seen to be done.

The second idea concerning justice and legitimate authority associated with modernisation is that a person who acts in accordance with modernity and the impartiality and morality of modern institutions is acting justly. In Joseph Raz's formulation the authority of the state is guided by its morality in acting to promote what is good. The state's authority derives from codifying as law the reasons for action towards others that people already have, for example, paying taxes to support schools or encouraging economic growth that will benefit all. Because this is reasonable, it is also legitimate and thus just (Raz, 1986). This notion that states can be active in creating the conditions for individuals to pursue meaningful lives, can be seen to animate ideas about global justice developed in the 1950s and 1960s, where this aspiration was seen to be articulated through states and the international machinery of the United Nations organisations, rather than through the connections of individuals or civil society organisations or a wider notion of the state concerned not just with government (Jones & Coleman, 2005).

These ideas about justice and equal opportunities had a particular effect on how research agendas were set. What was researched and measured in schools was success in teaching functional literacy and numeracy, proficiency in the national language and the psychological traits of modernity because these showed the extent to which just institutions were at work nationally. Hence, the explanatory force of methodologies concerned with measurement and large-scale surveys were stressed. The research paradigm suggested that improving institutions would expand provision and the poorest would eventually access school.

Basic Needs

Many problems associated with the uneven realisation of the optimism of modernisation theory were evident by the late 1960s. Pressing issues included widespread poverty which the new institutions seemed unable to overcome. Some brutal governments claimed they were acting in response to modernisation. The exclusion of some on grounds of race, ethnicity or gender from the institutions associated with economic growth and political legitimacy called into question the efficiency of modernisation. In the 1970s, a highly influential group of development economists critiqued the assumptions of modernisation that poverty would be eradicated by economic growth, the expansion of employment, higher incomes and the trickle-down effects of successful capitalism (Streeten, 1981; Stewart, 1985). The basic needs approach to social policy stressed one should not focus on particular outcomes or on humans as a means to social, economic or political ends. Basic needs theorists outlined how it was important to

consider those who might not be incorporated into successful modernisation projects, who might never be economically productive, and never increase economic growth. Some people might have important preferences that could not be satisfied on the same terms as everyone else, such as the old, the very young, those with disabilities or those who were excluded from political or economic participation because of historically located forms of discrimination on the grounds of gender, race or ethnicity. Wiggins made explicit that there was a normative basis to need. The argument he developed was that the importance of needs was that they expressed aspects of a condition of human flourishing. Failure to ensure a certain level of human flourishing – meeting basic needs – would constitute harm (Wiggins, 1988). One of the important contributions of the work on need was that it gave philosophic, political and economic visibility to ideas about care and concerns that modernisation theory had relegated to the private realm of the household, beyond the purview and resourcing of government policy (Reader, 2006).

In Frances Stewart's work provision of education and health were intimately connected with a minimal provision of a good life, below the threshold of which harm would result (Stewart, 1985). Thus the idea of education associated with the basic needs approach was that education *up to a certain level* was crucial to ensure human flourishing regardless of whether or not the dispositions of the person were made modern or the institutions associated with education were run in accordance with ideas about governance, democracy or efficiency. A second implicit idea was that basic needs in education could not be considered outside concern with health, housing, food security and other aspects of well-being. The multi-dimensionality of need and the implication that needs could be met by a range of persons or institutions (Reader, 2006) indicated that the aims of education would not be realised only in schools, but that it was important to address provision for basic needs in education in conjunction with work on all the other basic needs (Stewart, 1985).

The strength of the basic needs approach lay with the idea of thresholds and the interconnection with other areas of social policy. But with regard to specifying particular features of schooling, this clear direction presented a number of problems. Basic needs as applied to schooling came to be interpreted in a weak and a strong form. In its weak form basic needs in schooling came to be interpreted as a finite package of a certain number of years in school, generally 4–5, which were taken to mean that a basic need had been met. The problem with this was that computing the number of years children were enrolled in school without attention to what was taught or learned, how, and with what consequences, actually provided very little assurance that basic needs were being met (Unterhalter, 2007). Nonetheless, in early applications of the basic needs approach by UN organisations it was simply the number of years in school of children in particular countries that were analysed (see e.g., UNESCO, 1976; World Bank, 1979).

A stronger form of the basic needs approach in relation to education was articulated in the Jomtien Declaration on Education for All (EFA) in 1990 which launched the EFA movement as an alliance initially of UN organisations and some governments, but, increasingly from 2000, a movement taking in the majority of world governments, UN organisations and civil society (Chabbott, 1997; Mundy & Murphy, 2001). The purpose of EFA was to meet basic learning needs. These were defined very broadly:

Every person – child, youth and adult – shall be able to benefit from educational opportunities designed to meet their basic learning needs. These needs comprise both essential learning tools (such as literacy, oral expression, numeracy, and problem solving) and the basic learning content (such as knowledge, skills, values, and attitudes) required by human beings to be able to survive, to develop their full capacities, to live and work in dignity, to participate fully in development, to improve the quality of their lives, to make informed decisions, and to continue learning. The scope of basic learning needs and how they should be met varies with individual countries and cultures, and inevitably, changes with the passage of time. (WDEFA, 1990)

It can be seen that the prescriptions regarding functional literacy and numeracy to participate in the modern sectors of the economy or access the institutions of the state have been replaced by wider and fuzzier notions of literacy, numeracy, oral expression and problem-solving aligned with self-development, achieving a life of dignity and quality. There is no single set of ideas concerning curriculum content that is being prescribed. The second article of the Declaration stresses tolerating a plurality of ideas about curriculum, pedagogy and management and is concerned with situating EFA within existing ‘cultural, linguistic and spiritual heritage(s)’. The sharp distinction between the languages and practices of modernity and tradition has thus disappeared:

The satisfaction of these needs empowers individuals in any society and confers upon them a responsibility to respect and build upon their collective cultural, linguistic and spiritual heritage, to promote the education of others, to further the cause of social justice, to achieve environmental protection, to be tolerant towards social, political and religious systems which differ from their own, ensuring that commonly accepted humanistic values and human rights are upheld, and to work for international peace and solidarity in an interdependent world. (WDEFA, 1990)

In this form supporting basic learning needs turns the pedagogy couplet from teaching to learning, from outcome to process. What is important is not moulding particular dispositions of a modern person, who is rational and responsible, in relation to the institutions of the state and the economy. Facilitating learning, seen as synonymous with flourishing, empowerment and surviving in an interdependent world, now becomes key. It is the relational and contextual aspects of the situation of learner that is a matter of concern. Thus, the question of selecting or sequencing school knowledge and managing that process disappears from the global agenda and come within the purview of particular governments or schools. In this transition these discussions may well lose the dimensions of need articulated in documents such as the Jomtein Declaration. For example, in Bangladesh, state expansion of mass primary education and the introduction of a competency-based curriculum was linked to local political shifts, which involved aid agencies and aid packages on teaching and learning, but which interpreted meeting basic needs not with the emphasis on learning and empowerment suggested by WDEFA, but more in the spirit of modernisation (Davis, 2001;

Hosain *et al.*, 2002). In Kenya, as the 1990s progressed, a number of international development partners withdrew assistance because of high levels of corruption and the perception that Kenya was a 'reluctant reformer' (Collier, 2004). This exacerbated some of the effects of structural adjustment which had resulted in the imposition of charges for schooling. However the Government of Kenya embarked, nonetheless, on a programme, with some donor assistance, to enhance the supply of textbooks, and deepen advice and training for teachers. The emphasis, however, was on improving school provision, more than meeting the basic learning needs of the poorest (Nzomo *et al.*, 2001). These instances indicate how the global agenda on meeting basic learning needs, was interpreted in diverse ways in national policy.

Concerns with justice and need brought together discussion of what needs were basic and fundamental to human life, and what priority should be given to basic needs. There was considerable debate about whether basic needs were satisfied by commodities or conditions, and the extent to which non-marketable goods and services associated, for example, with emotional needs, were within the realm of public action (Sen, 1981; Doyal & Gough, 1991; Dasgupta, 1993; Gasper, 2004). However, this philosophical discussion of need was not considered in putting into practice policy based on the rather limited conception that basic education needs were fulfilled by 5 years in school (Unterhalter, 2007).

Nonetheless, the conception of basic needs and the multi-dimensional aspects of a person's flourishing this suggested, raised the question of justice in terms not related to the authority or efficiency of institutions but much more within the approach mapped out by political liberalism which stressed that there is no comprehensive all encompassing notion of the good (e.g. linked to modernisation). Rather it is important to consider how an overlapping consensus can be formed so that people will collaborate on the basis of ideas about justice and reasoned discussion they hold in common in an overlapping consensus (Rawls, 2005). Exploring and resolving difference through this process of consensus building could allow questions about priority or equality or threshold entailed in a discussion of need to be adjudicated. The EFA movement with its establishment of forums for very different states and multilateral bodies to meet, its slow opening of space at the table for international NGOs and its concern with issues of quality that do not touch on content, may be seen as one instance of this form of political liberalism in action. Elsewhere I have termed this a thin cosmopolitanism (Unterhalter, 2007) in that it was concerned to support global action for provision for basic learning needs, but not to demand further reforms in relation to political economy, culture or gender relations.

Although the basic needs approach in education presented a clear critique of modernisation theory, and drew on very different ideas of the person and of justice, the approach did not generate different research methodologies. The very methods associated with reviewing the extent of modernisation – that is, large-scale surveys and interpretation of census data – were used in assessing whether basic learning needs were being met. Some of the research questions implicit in the approach – for example, how basic learning needs were understood, and what level of provision was considered sufficient – called for qualitative methodologies, but few studies of this form were used in developing policy. In the expansion of EFA, as Karen Mundy remarked, the political and ethical literature on global obligations for the poorest was little discussed

(Mundy, 1998). It seems that the weak interpretation given to basic learning needs as a bounded package of provision and the thin cosmopolitanism invoked in global and national interpretations of EFA was legitimated by research methods which did not depart from the terrain mapped by modernisation theory. This may have contributed to this approach not generating global action commensurate with its ethical concerns.

Human Capital Theory

In the 1960s, ideas about the economic value of schooling itself, not the particular subjects or dispositions of citizenship so central to modernisation, were elaborated. Gary Becker's (1964) classic work *Human Capital* elaborated the notion of human capital within neoclassical economics registering that investment in humans could be viewed as similar to investment in other means of production, like factories or mines. Investment in human capital, just like investment in physical infrastructure would yield a rate of return, which could be calculated. Becker's study set out to estimate the return to college and high school education in the United States, but he was able to show that it was not only schooling per se that was significant for growth, but a range of other investments in people including health and on-the-job training.

Developing Becker's work, Theodore Schultz, set out to map how rates of return from education could be calculated in countries with different levels of income, different variables concerning wage patterns, and different human attitudes to foregoing earnings to develop human capital. Schultz's hypothesis was that calculating rates of return from investment in human capital would confirm how important investment in schooling and research was for the productivity of the labour force and the capacity of the economy to grow (Schultz, 1971).

Detailed work investigating rates of return from education to families and national economies was undertaken by George Psacharopoulos in the 1970s and 1980s. In bringing together data from many countries on the role of education in economic growth, he set out to examine how the profitability of investment in education compared with profits from investment in physical capital, symbolised in the rhetorical question investment in schools or steel mills? (Psacharopoulos, 1973) Psacharopoulos was also interested in whether inter-country differences in human capital could explain differences in per capita income, what the rate of return by level of education was across countries, whether there were differences with regard to the level of public subsidy to education, and whether subsidies reduced or increased incentives. Psacharopoulos' findings were to have profound significance on international policy with regard to investment in education. On the basis of the data he examined he concluded:

[R]ates of return decline by the level of education. Looking first at the social rates of return, the average for primary education is 19.4 per cent, for secondary 13.5 per cent and for higher 11.3 per cent. (Psacharopoulos, 1973)

This stress on the high rate of return from primary education was to orient a generation of planners in the World Bank and other international and national institutions

to focus on this level. There has been a critical discussion of the way Psacharopoulos calculated rates of return and reached these conclusions (Bennell, 1996), but the policy implications of his work were nonetheless enormous.

Generally, work within a human capital framework assumes that labour markets work rationally and efficiently and that once schools have developed certain aspects of human capital the labour market will allocate people to occupations that are appropriate for their level of skill. The framework does not take account of segregated labour markets where people, irrespective of their level of education, are allocated to particular jobs on the grounds of race, gender, or assumptions about class or caste. The framework tends to view schooling something like a machine which children enter and exit with their human capital appropriately topped up. Enhancing human capital, like developing the political subjects of modernisation, does require particular forms of knowledge and particular pedagogies that enhance this learning. But the theory suggests that there will be different kinds of human capital. Thus, different schools may enhance human capital differently. For example, elite schools will be required for managers and good-enough schools for those who will be semi-skilled workers. As both groups will help contribute to economic growth the different emphasis in curriculum and pedagogy is not a major issue. The ways in which schools may provide different learning environments for children of diverse backgrounds with very divergent outcomes is not considered significant unless the schooling is so poor and children learn so little it does not increase human capital. Thus, writers interested in human capital will generally consider whether the school is efficient, in other words, how many hours of instruction are provided, what the level of teacher qualification is, and whether children pass. The UNESCO Global Monitoring Reports, published since 2002, were strongly influenced by human capital approaches in developing indicators to measure EFA, compiling statistical tables on inputs and outputs, that is, enrolment rates, retentions and teacher training (UNESCO, 2003) Writers working within this framework are generally not interested in debates about curriculum hidden or in use, constructed or negotiated processes of learning or the identities of teachers.

While some of the writing on human capital noted differential rates of return for women and men (Woodhall, 1973; Schultz, 1995) their general conclusion was not that structures of gender or race inequality should be considered, but that more education should be growth is provided for these groups to improve levels of economic growth. It can be seen that what is important for all the writers on human capital theory. In this framework schooling assists growth and a major social obligation is to increase access to schooling to facilitate economic growth. What this framework does not register is questions of value that extend beyond the economic sphere, questions of inequality and how to address this, and how or whether critical pedagogy or new forms of knowledge that are not deemed appropriate for enhancing economic growth should be incorporated into school.

The idea of the person inherent in human capital theory is an active agent primarily concerned with utility maximisation, which is achieving the highest level of well-being or happiness for himself, herself or a society. However, most writers on human capital did not look at an individual and the mental metrics she or he might use in making this assessment. Assumptions were made about people in families or nations

where the individual person disappeared into a larger unit bent on utility maximisation for all its members, giving scant attention to distributional issues or different needs. Thus, as Naila Kabeer pointed out for views about utility maximisation generally, the assumption was that there were no gender dynamics in families and that fathers or husbands would always act to enhance utility for all members of a family, despite research evidence which showed that in many contexts sons were preferred over daughters (Kabeer, 1994). When these ideas were translated into education policy (see e.g., King & Hill, 1993) the assumption was that if cost or distance barriers to schooling could be removed the rationality of utility maximisation would be evident.

Human capital theory draws implicitly on ideas about justice associated with classical liberalism, as it came to be interpreted in the era of Thatcher and Reagan, namely, that the individual is a rights bearer with regard say to rights to education or to economic accumulation. These rights pre-date the existence of any particular form of the state and do not take account of different situations or social contexts. Free markets that allow for the circulation of ideas, different kinds of schools, or different forms of employment must not be inhibited. An individual's rights to education and to the returns from investments in education should be protected by a limited form of constitutional government. In this limited interpretation of the ideas of Adam Smith concerns with social context and the political dimensions of the economy are underplayed. Ideas associated with basic needs of care, obligation and overlapping consensus on social justice are not of particular interest to this interpretation of classical liberalism with its stress on a single individual's rights to accumulation and education.

The assumptions about ontological rather than ethical liberalism, and the notion that utility maximisation entailed simply economic growth, generated a concern to establish efficient institutions to deliver an education that articulated well with the economy. The research methods associated with the approach tended to be large-scale surveys which looked at the level of rate of return and considered how school inputs related to outputs. While a number of qualitative studies were done to understand why some families or particular ethnic or social groups did not make use of schooling with particular attention to gendered exclusion (Herz & Sperling, 2004) the data were not utilised to consider wider aspects of need or discrimination. The implication was that obstacles to increasing the rate of return from education were located within families, communities and inefficient polities. The remit of global action was thus to help governments remove these and enhance growth, from which the poorest, as a result of trickle down, would ultimately benefit.

Development and Underdevelopment

Marxist critiques of development theories based on growth reach back to the nineteenth century, but from the 1960s, took a particular form in considering how development and underdevelopment could be articulated and how the persistence of poverty was not an oversight, but a key dimension of capitalism which required a reserve army of labour, who were poorly educated and impoverished, in order to drive down the wages of those employed and buy allies amongst a relatively small skilled segment

of the working class (Wolpe, 1980; Leys, 1996). Walter Rodney's widely read *How Europe underdeveloped Africa* (1973) made the case that the slave trade and other interventions in African political economy reaching back to the fifteenth century had resulted in exploitation and forms of domination. Martin Carnoy's (1971) *Education as cultural imperialism* extended this analysis looking at the ways in which the school system had been allied to repression.

The assumption in the Marxist view of education and development was that schools reproduced capitalist or imperialist relations. Thus, in a political economy marked by exploitation and the articulation of modes of capitalist and non-capitalist production, schools would form ideas about the place of children according to class or gender. In the research within this framework in South Africa (where development and underdevelopment coincided in one country), race was generally viewed as equivalent to class and the ways in which the school system reproduced the racialised occupational structure was a major theme (Kallaway, 1984; Nkomo, 1990).

The challenge to the Marxist critique of development was how education could be transformative. Paulo Freire (1968, 1970) developed the notion of conscientisation within a Marxist framework elaborating how misunderstanding of social relations associated with capitalism could be transformed. Freire gave particular attention to the nature of the relationship between learners and teachers, a departure from some Marxist writing on education, where the school was seen as merely reproductive of capitalist relations of production (Wolpe, 1990).

The Freirean approach to school took basic learning needs much further than suggested in the Jomtien Declaration, suggesting schools should not only satisfy needs and empower individuals, but should also help them to transform themselves and their societies. Implicit in this work is a notion of a person, who is both made by his or her social conditions, but also has the capacity to change. Change is both personal and has a consequence for changing social relations. Marx's statement that man can change history, but not on terms of his own making, sums up a view of the person who is at once constrained by global capitalism, class structures and schools that mirror this, but who also has the potential, through collective and transformative action, to change this. Attempts have been made to put these ideas into practice in schools and adult literacy classes with explicitly transformative pedagogies. Generally this entails developing a different form of school management from that focused on delivering only outputs. The management ideas associated with Freirean pedagogies tend to stress the participation of learners, teachers and communities in reflection and critique. While Freirean educational work may have been imperfectly realised or difficult to sustain, in settings as diverse as Latin America, Southern and Eastern Africa and India, they offer powerful examples of how teachers and learners engage with critiques of their society (Archer & Costello, 1990; Stromquist, 1997; Motala & Vally, 2002; Abadzi, 2003; McCowan, 2008).

The concern for justice associated with this approach is linked with discussions of egalitarianism and redistribution and with attending to how conditions in schools can be made more equal or the formation of educators can be linked to the struggles of the poorest (Lynch & Lodge, 2004; Hill, 2003). In Katarina Tomasevski's work (2003), the importance of justice in making education free for all children, particularly the poorest, presents a view of justice grounded in a conception of rights to education that is

different from that associated with human capital theory. These moral rights that evoke equality and non-discrimination require satisfaction partly because of the historical global relations of dominance and subordination, but also because of the potentially transformative power of education. Distribution and transformation are thus the major emphases in these discussions of justice.

In advancing these arguments quantitative and qualitative research methods have been used. While quantitative studies have been important to document inequalities in distribution by class, race, gender or region, qualitative investigation has been used to show how Freirean educational experiences transform lives in many of the works cited above. The methods thus give explanatory weight to the framework, but the forthright critique of global capitalism and national accommodations with inequality have not translated comfortably into programmes for action.

Postmodernism and Postcolonialism

From the 1980s postmodernism and post-structuralism, drawing on work such as Edward Said's study of colonial relations in *Orientalism* (1978) and Michel Foucault's work on discourse (1969, 1977), began to present a very clear paradigmatic challenge to ideas about education, society, international development and social justice of previous decades. These influences came together in postcolonial theory, which had its greatest influence in discussions of art and literature, but which raised a number of salient questions for education (Loomba, 1998).

All the preceding approaches, despite their different emphases, worked with similar aspirations to extend the distribution of education. There are distinctions between those that were more attentive to wider social relations concerning power, inequality and need beyond education (basic needs and underdevelopment) and those that were more confident of the connection between education and economic growth (modernisation and human capital theory) underplaying the structural dimensions of injustice. The challenge postcolonial theorising presented was to consider how the very paradigm of education and international development carried within itself assumptions about Western superiority and constructions of third-world peoples as 'others'. A binary opposition was therefore posited between 'the West' and 'the rest', colonial and postcolonial states or dominant discourse on appropriate education and the multiple experiences of colonised peoples. The latter, it was noted, were always portrayed in deficit in relation to dominant forms of knowledge, homogenised by particular identities, such as 'third world woman' and silenced by the languages of power concerning policy discussion (Mohanty, 1979; Bhabha, 1984; Spivak, 1988). In postcolonial theorising the multiplicity of identities, constructed, reconstructed, hybridised and resisted in different settings was of particular note. The political task was to consider that dominant languages and discourses may be the only vehicle available to subalterns to contest the identities of subordination given to them, yet that language erased those very identities (Spivak, 1999). The capacity to see things, nonetheless, as it were in double exposure was a key concern (Minh Ha, 1989). Thus the colonial past was always in the present of education reform, and all activities had multiple resonances.

Underpinning this paradigm shift was a notion that all action can only be understood through discourse and that the key social relations to be analysed are forms of language and representation. Thus the notion of the person associated with this approach notes fragmented identities and considers human practices of making and using language, emphasising this is not a simple act of agency but entails action within powerful formations of already formed languages systems, structured both by forms of words and the nexus of ideas concerning, for example, race, gender or rationality.

Because the focus was on a critique of discourses and identities, there was very little concern at first with the content of what was taught in school or the outcomes of schooling. Initial work within this framework identified policy discourses and discursive shifts. Thus, for example, the process through which ideas about unifying education and training into one National Qualification Framework were diffused in South Africa were explored using a range of different methods from discourse analysis (Lugg, 2007). In India the tropes entailed in thinking about a new saffronised curriculum were noted (Kamat, 2004). However, later work within a postcolonial frame began to look at forms of negotiation and resistance within classrooms to dominant discourses looking closely at children and teachers' identity formation and discursive forms (Hickling Hudson, 2003). It can be seen that the emphasis on discourse and process meant that little attention was given to management or distributional issues.

In contrast with the concern with institutional and distributional approaches to justice, which characterise the foregoing frameworks, postcolonial theorising raises the question of justice in terms of recognition. The problem outlined by the approach is how to value subordinated, multiple, shifting identities, and how, acknowledging this, conditions of justice are to be established (Fraser, 1997; Spivak, 1999).

These assumptions about the person – discursively situated with shifting identities – and about justice, as no longer primarily a matter of distribution, have generated a profound change in methodologies. Deconstruction and analysis of discourse and identity in education became a major concern. Methods borrowed from literary criticism, social linguistics, history and cultural studies have been used. As a consequence more textured understandings of processes of policy formulation, identity negotiation and the experiences of subordination have been generated. The remit of what attending to the education of the poorest might entail has broadened considerably, but the breadth has not generally been accompanied by concern with strategy and policy.

Human Development and the Capability Approach

The human development and capability approach, linked with the work of Mahbub Ul Haq (1995), Amartya Sen (1992, 1999) and Martha Nussbaum (2000, 2006) repositions education as a distributional issue, but gives considerable attention to human diversity, albeit in a different guise to that suggested by postcolonial theory.

Human development is defined by Ul Haq as an approach where

[p]eople are moved to centre stage. Development is analysed and understood in terms of people. Each activity is analysed to see how much people participate in

it or benefit from it. The touchstone of success of development policies becomes the betterment of people's lives, not just the expansion of production processes. (Ul Haq, 1995)

As a consequence, health and education, which form people, are as important to development as what people do in their work, politics or leisure. Implicitly education is here both a process that encourages human development and an expression of the enjoyment of human development.

Ul Haq's ideas about human development drew explicitly on Sen's notion of capabilities and Sen's perception that in looking at equality one must not assess equality of opportunity or outcome, but capabilities, that is, a person's "ability to do valuable acts or reach valuable states of being ... the alternative combinations of things a person is able to do or be" (Sen, 1993, p. 30). The approach thus points to the importance of evaluation of social, economic and political arrangements that people can and do enjoy for an expansion of freedoms. Thus in dealing with education we need to evaluate not simply inputs (numbers of teachers or classrooms) or outputs (level of education qualifications), but also whether there are a range of opportunities for valued actions and states of being to be achieved and whether this is accomplished. Sen is particularly interested in human diversity and the ways in which people in different situations convert resources like education into valued functionings. For example, women in a patriarchal family might consider they have less need for education because they do not attribute value to their contribution to the family (Sen, 1990). Widening the capability set addresses diversity in ways that diverge from the postcolonial plea for the recognition of difference without attention to distribution or social institutions. Sen also stresses the significance of participation in processes to select valued capabilities and decide on forms of provision (Sen, 2005). In developing some of these ideas further Martha Nussbaum identified a list of central capabilities for human functioning, where education figures large (Nussbaum, 2000). It is evident that all three view the purpose of education as much wider than developing the skills that will enhance economic growth. They are not only interested in schooling as a system of inputs and outputs, but as nurturing processes of critical reflection and connection with others that are intrinsically ethical, and not just instrumental.

The utilisation of the human development and capability approach in the practice of education is currently more apparent in terms of aspiration, rather than practice. Although the state of Madhya Pradesh in India utilised this framework in drafting its education policy, the interpretation in districts and schools showed little signs of a full engagement with the key ideas (Page, 2005). Arguments for the potential of the approach in developing higher education pedagogies, assessments of education provision for those with disabilities, new forms of management, and curriculum to engage with HIV or the training of social workers have been developed, but remain to be put into practice (Walker, 2006; Terzi, 2005; Bates, 2007; Unterhalter, 2008; Otto & Zigler, 2006). To date the most significant instance of human development and the capability approach at work in education has been through the generation of alternative indicators to assess development.

Ul Haq suggested a measure of human development that would allow for rankings between countries or districts similar to measures of GDP, but express more fully the

range of valued aspects of living the human development approach encompassed. Sen worked on the mathematics for the Human Development Index (HDI) (Sen, 2003). Subsequent work generated indices to assess gender, poverty and rights. The HDI methodology was adapted for measuring progress on EFA in the Education Development Index to measure progress on EFA (UNESCO, 2003). A Gender Equality and Education Index was subsequently developed (Unterhalter *et al.*, 2005).

The idea of the person in the human development and capability approach is both active and reflective, considering not just utility maximisation as interpreted by human capital theory, or incorporation into modernity, but a wide range of valued 'doings and beings'. There is considerable attention paid to diversity and different conditions which constrain the realisation of capabilities. The person is not only dedicated to economic growth, as in human capital theory. She or he may be very much constrained by conditions of exploitation and oppression as outlined in Marxist and postcolonial theory. But the assumption in postcolonial theorising that the person cannot be conceptualised or act outside particular forms of discourse and that experiences of hybrid identities raise significant questions with regard to justice is questioned.

Although in formulating his notion of capabilities, Sen criticised conceptions of basic needs (1981), in practice there are many ways in which human development may be seen as a continuation of the basic needs approach. The links between capabilities and basic needs continue to be much discussed and concern in the capability approach to broaden the scope of evaluation from one-dimensional outputs to broader notions of flourishing has much in common with assessments of need (Reader, 2006; Alkire, 2002; Terzi, 2007).

Sen and Nussbaum both developed their ideas about capabilities, partly as an engagement with the work of John Rawls in *A theory of justice* (1973) and *Political Liberalism* (2005). They are interested, as he was, in distributional questions of justice, but they try to take his ideas further as the very notion of capability provides dimensions for thinking about justice and distribution that supplement Rawls' stress on primary goods (Robeyns, 2006a). Further, Sen suggests, a theory of justice in contemporary times of grave inequalities requires not a complete transcendent theory but insights to make comparative assessments that enable action to make the world less unjust (Sen, 2006a). In some conditions, he therefore implies questions about justice must be concerned with recognition, language and identity, but the route to this conclusion is not through critiques of discourse, but through rigorous engagement with debates in political philosophy and acknowledgement of how the construction of antagonistic identities is generally associated with injustice (Sen, 2006b).

The capability approach has much in common with a human rights approach which emphasises equality and non-discrimination and obligations to deliver in education, for instance. The claims people can make for protection against abuse and deprivation associated with human rights support a number of ideas about justice invoked by the capability approach. Robeyns (2006b) draws on suggestions by Brighouse (2004) to suggest that the notion of capabilities might provide a normative basis for thinking about rights. Vizard (2006) argues that human rights and the capability approach can work together in campaigns against poverty to hold governments accountable for non-fulfilment of obligations.

Both Sen (1999) and Nussbaum (2006) have drawn out how their visions for justice are global, not just local and given education a significant place in terms of the obligations of people to each other to expand capabilities. This demands thinking through education in relation to debates about cosmopolitanism and the processes of global justice.

The idea of the person and associated conceptions of justice in the human development and capability approach have generated a distinctive methodological approach. Work within this framework is characterised by a high level of multi-disciplinarity drawing on philosophy, economics and sociology, and crossing disciplinary boundaries to link together different forms of data. Thus social statistics are utilised in innovative forms of combination and qualitative accounts provide rich insight into how capabilities are understood in practice (Raynor, 2007; Uyan, 2007). In using new explanatory frameworks to address the issue of global action on education the approach appears to have overcome some of the difficulties of not generating alternative methods encountered by the basic needs approach. Furthermore, the location of human development research within some of the UN organisations gives a level of access to powerful settings thus far denied critical approaches such as underdevelopment and postcolonial theorising. However the capacity of the human development and capability approach to make use of this advantageous conjunction in relation to affecting the practice of education for the poorest remains to be seen.

Conclusion

This chapter set out to explore the ways in which education was placed in relation to different theories of development and the implications of associated ideas about social justice for the research conducted. The discussion has revealed how education has been linked by different development theories with particular dispositions or outcomes (modernisation and human capital theory), with problems of imperialist exploitation and positioning of third-world people as the subordinate 'other' (underdevelopment and postcolonial theory) and with the potential to bring about changes that attend to the needs of the poorest, facilitate critical reflection and expand opportunities for demanding and living a life one has reason to value (basic needs, underdevelopment and the capability approach). The most mainstream approaches (modernisation and human capital) situate justice primarily as the remit of individuals or institutions. Critical accounts highlight the social dimensions of justice, be they the processes of political liberalism, the demands of rigorous redistribution or concerns with recognition. While both basic needs and human development and the capability approach have significant presence in the policy documents of UN institutions and the programmes that flow from these, the ideas about justice associated with both approaches are often ignored. The education assumptions of human capital theory and modernisation continue to command respect and widespread understanding of the research methods they use contribute to this. The challenge is to turn the social justice aspirations of many global EFA documents into policies that express their core ideas and develop rigorous research agendas to sustain global action on poverty and education.

ON EDUCATIONAL KNOWLEDGE – A NEGLECTED THEME IN COMPARATIVE EDUCATION

Andreas M. Kazamias

Comparative education, as it developed in the second half of the twentieth century, has been concerned mainly with the study of educational systems (their philosophies, organisation and governance), educational institutions (mostly schools, colleges and universities), educational policies, school and society relationships (political, social and economic), and educational change, reform and development. Discourses and studies in such areas have been carried out in national state contexts, in ‘rims’ or regions (e.g., the Pacific and the Mediterranean ‘rims’, or the European Union, Latin America, Africa and the Middle East), or cross-nationally and cross-culturally. Paradoxically, prominent themes that are germane to educational systems and the educational process, although not entirely neglected, have not received the attention that they deserve. The themes in question have to do with educational knowledge, or the content of the curriculum, and with pedagogy, in other words, with the internal or ‘intrinsic’ aspects of ‘schooling’.

Knowledge – its selection, organisation/classification and acquisition – has been of crucial importance to all modern systems of education. According to M. F. D. Young, “*the acquisition of knowledge* is the key purpose that distinguishes education, whether general, further, vocational or higher, from all other activities”. For this reason, “debates about knowledge are crucial; by this I do not mean specific knowledge contents, although they are important, but the concepts of knowledge that underpin curricula” (Young, 2008, p. 81). Of crucial importance are also debates about the related theme of *pedagogy*, defined by Robin Alexander, a contributor to this section of the Handbook, as “both the act of teaching and its contingent theories and debates-about, for example, the character of culture and society, the purposes of education, the nature of childhood and learning and structure of knowledge”. Pedagogy, Alexander explains further, “is the domain of discourse with which one needs to engage if one is to make sense of the act of teaching – for discourse and act are interdependent, and there can be no teaching without pedagogy or pedagogy without teaching” (Alexander, 2006, p. 6).

The study of the curriculum, as the codification of areas of *knowledge* into ‘subjects’, and curriculum change have not been entirely absent in comparative education, as Anthony Welch pointed out in 1991 (Welch, 1991); nor has ‘*pedagogy*’. However, in 2000, Angela Little, a specialist in development studies, could write in the British journal *Comparative Education* that between 1977 and 1998

only 6.1% of that journal's articles "dealt with 'curricular content and the learner's experience'" (quoted in Alexander, 2006, p. 2). And in the same issue of the journal, Robert Cowen wrote that "we are nowhere near coming fully to grips with the themes of curriculum, pedagogic styles and evaluation as powerful message systems which form identities in specific educational sites" (Cowen, 2000, p. 34).

This chapter is a comparative-historical analysis of the theme/problem of educational knowledge as codified in the curriculum of the secondary schools of England at two periods of modern English history: the mid-nineteenth century and today. It tackles the perennial curriculum question of 'what knowledge is of most worth'. At the same time, passing references are made about the same problem in continental Europe and the United States. Other chapters in this section of the Handbook examine the theme of 'knowledge' and 'knowledge traditions' in various historical and national contexts. And one, in particular, deals with the almost forgotten theme of 'pedagogy'.

What Knowledge Is of Most Worth? A Historical Conception

'Knowledge' and its valuation has been an epistemological concern of all major philosophers and educational thinkers since antiquity; it has also been a curriculum concern of educational policy-makers and pedagogues since the emergence and development of national modern systems of education in the post-Enlightenment world. For example, Plato's rational account of the educational ascent from 'belief' to 'true' rational knowledge, Aristotle's stratification of knowledge into prestigious theoretical "liberal arts/sciences" (*eleutheriai epistemai*) and 'philistine' (*banausic*) "illiberal practical arts", Descartes' scientific rationalism, Locke's empiricism, Herbert Spencer's "scientific culture" and John Dewey's problem-solving instrumentalist "how we think", have been influential, to a degree more or less at different historical periods, in the educational thinking and planning about the selection, organisation and stratification of 'curriculum knowledge'.

In the post-Enlightenment era of modernisation and democratisation, when national public systems of education were being formed, Herbert Spencer, the English social evolutionist sociologist, raised the question of 'what knowledge was of most worth' in an industrial society like the English, and hence of value to be included in the school curriculum (Spencer, 1859). In raising this question, Spencer was contesting the hegemony of 'liberal humanistic *paideia*/culture' that characterised the European and American knowledge traditions and the curriculum of the schools and the universities, not only of England but of continental European countries (e.g., France, Germany, Italy, Greece) and the United States, as well (McClellan, 1995; Winterer, 2002; Dimaras, 1973; Kazamias, 1960).

Spencer's question, raised at the same time as the publication of Charles Darwin's scientific treatise *The Origin of Species* (1859), sparked a controversy involving some of the leading mid-Victorian English intellectuals (e.g., philosophers, classical scholars, poets and scientists), and practicing educationists, and it revolved around the content of 'general' or 'liberal' education, in terms of 'curriculum studies', which at the time was considered to be the most valued and the most prestigious type of education. Specifically, "the great controversy of the day", according to the political

philosopher J. S. Mill, a key participant in the debate, was “the vexed question between the ancient languages and the modern sciences and arts; whether general education should be classical – let me use a wider expression and say literary – or scientific” (Mill, 1867, p. 5). A comparative historical analysis of the controversy was made by me back in 1960 (Kazamias, 1960), and would not be necessary in this section of the Handbook. For my purposes here, it would suffice to comment briefly on what knowledge was considered to be ‘of value’ or “of most worth” at a specific historical period – the nineteenth century – in post-Enlightenment modernist Europe, and, therefore, what ‘knowledge’ in the form of ‘subjects’ or ‘studies’ was “of most worth” to be included in the curriculum of the secondary schools.

At the time that Spencer raised the famous question, the dominant concept of ‘most valued knowledge’ in England and in continental Europe could be epitomized as the ‘Eurocentric liberal humanistic canon’ or the ‘Eurocentric liberal humanistic *paideia*’ with classical studies – ancient Greek and Latin languages and cultures – as its epistemic core. In France, it was intrinsic to the concept of *culture generale* (Halls, 1965), in Germany it was referred to as *Allgemeine Menschenbildung* (Lovlie *et al.*, 2003) and in Greece, as *enkyklios paideia* (Dimaras, 1973; Antoniou, 1987). The Eurocentric liberal humanistic canon/*paideia* denoted essentially ‘literary-philological studies’; it was ‘non-utilitarian’, ‘non-practical’ and economically ‘non-instrumentalist’ in its orientation; it was considered to be of higher status than vocational education; and it was legitimised epistemologically in terms of its mental disciplinary value, and morally, in terms of its intrinsic quality in cultivating Christian and other moral virtues, for example, piety, godliness, truthfulness, patriotism and the ideal of public service. Interpreted ‘sociologically’, however, school knowledge and the content of the curriculum are “socially produced and acquired” (Young, 2008, p. 88) and, therefore, they cannot be looked at as being independent of the social and political historical context in which they are developed; the dominance of the general ‘liberal humanistic *paideia*’ can be illuminated by viewing it through the prism of the elitist, nationally ‘monochromatic’ culture of nineteenth-century England, and the concomitant English elitist political power structure. In such a historical context, what was particularly “extraordinary”, according to the historian D. W. Brogan, “was the idea that only a ‘public school’ could give an education fitting a boy for command in business, in politics, in the army, the civil service, even in the arts” (Brogan, 1943).

In the ‘great controversy’ of the 1860s, Spencer and eminent scientists like T. H. Huxley, J. Tyndall and M. Faraday contested the hegemony of the classical literary humanistic education, and championed the cause of scientific education for an important place in the curriculum of the schools. These and others, like the classicists F. W. Farrar and H. Sidgwick, and poets like M. Arnold and J. Ruskin, argued in favour of a general liberal education that would include classical humanistic studies, sciences and other modern subjects such as history and modern foreign languages. (Kazamias, 1960; Jordan & Weedon, 1994). It was argued that the elitist Eurocentric classical humanistic type of knowledge and *paideia* could not meet the needs of a developing modern industrial and democratic society. The inclusion of science, for example, into the curriculum of the prestigious Grammar Schools and the Public Schools was advocated not only for its mental disciplinary value, but also for its instrumental utilitarianism,

“realism and naturalism” in an industrial society. As the historian J. S. Brubacher has noted, T. H. Huxley, the champion of scientific education, “took the general line that it was an extremely shortsighted policy for a great colonial nation like England with vast industrial and commercial interests to fail to give instruction in physics and chemistry on which its industrial and commercial greatness rested” (Brubacher, 1947, p. 265).

The questioning of the hegemony of liberal humanistic knowledge, with classical studies as its core, was also evident in France, Germany and the United States. In France, for example, where the dominance of a humanistic general culture was even more entrenched than in England since the days of Napoleon, according to the historian F. Ringer (1987), “from the 1870s to the end of the century the running debate over the special or modern programme ... was accompanied by an almost equally intensive discussion of the classical secondary curriculum” (for France, also see Talbott, 1969; for Germany, see Albisetti, 1987; for the United States, see Kliebard, 1986).

Although in England and in continental Europe the nineteenth-century educational modernists were calling for an expanded knowledge-based curriculum to include science and other modern subjects, their conception of an expanded general education, knowledge or *paideia*, ‘of most worth’, was still elitist, Eurocentric, theoretical, privileged and “liberal” in the Aristotelian meaning of the term. Except for Spencer’s conception, it did not include what Aristotle called *banaisic*, that is, philistine, non-theoretical, and “illiberal” practical studies/arts. Towards the end of the nineteenth century and the beginning of the twentieth, in England, France and Germany, general education was expanded and modern ‘liberal studies’ were included in the curriculum of the English secondary Grammar schools, the French *lycées* and the German *Gymnasias*.

Spencer’s idea about curriculum knowledge ‘of most worth’ was not heeded in Europe. It was heeded in the United States, where Spencer was widely read, as reflected in the Cardinal Principles Report on the Reorganization of Secondary Education in the United States. According to Kliebard, an authority on the history of the American curriculum, “By far the most prominent portion of the report”, which was a major landmark in secondary education in the United States, “was the statement of the seven aims [principles] that would guide the curriculum: 1. Health. 2. Command of fundamental processes. 3. Worthy home membership. 4. Vocation. 5. Citizenship. 6. Worthy use of leisure. 7. Ethical character” (Kliebard, 1986, pp. 112–114). In his historical analysis of the development of the American curriculum, Kliebard further noted “that 1918 may be regarded as the year when the humanist position reflected in Eliot’s Committee of Ten Report [published in 1893] was forced to go on the defensive, no longer playing the dominant role it once did in the battle for the American curriculum” (Kliebard, 1986, p. 115).

What Knowledge Is of Most Worth in the ‘Europe of Knowledge’? The Late Modern Sequel in the European Union

In Western Europe and America, what knowledge is of most worth, what the essential knowledge ingredients of the curriculum of the schools should be, and how school knowledge should be organised and taught continued to be themes/questions that were

discussed at different historical periods in the twentieth century. Debates of this nature have been especially manifest in the decades following Second World War. The question posed by Herbert Spencer “what knowledge is of most worth?” is as basic and thought-provoking today – in what I have called in another chapter in Section Seven of this Handbook, “The Brave New Cosmopolis of Globalisation” and “The Information/Technological Knowledge/Learning Society” of late modernity even postmodernity (also see Castells, 1998) – as it was in the nineteenth-century industrial *cosmos* of Euro-American modernity. The literature on this theme is vast and even a cursory review of it is beyond the scope of this chapter. I examine some post-war key developments and discourses on this theme in the Anglo-Saxon world in another context in another chapter, already mentioned, in Section Seven of this Handbook.

Knowledge Society

Knowledge society (KS) and such co-extensive terms as ‘information society’ and ‘learning society’ have recently become dominant discourses with respect to the economic robustness and development of European Union (EU) and its member states. “The Europe we are building”, the French minister of education is said to have declared in 1998, “is not only the Europe of the Euro, the Europe of Banks and the economy; it must also be the Europe of Knowledge”. In the White Paper *Growth, Competitiveness and Employment* issued in 1993, it was stated that, in view of such changes in the world as ‘globalisation’, the coming of ‘information society’, and the rapid development of techno-science, it was imperative that the EU be transformed into “knowledge- based” societies (European Commission, 1993). And in the much-publicised and influential White Paper *Teaching and Learning: Towards the Learning Society* of 1995, one reads: “Be that as it may, the countries of Europe today have no other option. If they are to hold their own and continue to be a reference point in the world, they have to build on the progress brought about through closer economic ties by more substantial investment in knowledge and skills” (European Commission, 1995, p. 1).

What is a knowledge society? Knowledge society has been conceptualised in various ways. A. Hargreaves, has conceptualised KS in terms of three dimensions:

First, it [KS] comprises an expanded scientific, technical and educational sphere. ... Second, it involves complex ways of processing and circulating knowledge and information in a service-based economy. Third, it entails basic changes in how corporate organizations function so that they enhance continuous innovation in products and services, by creating systems, teams and cultures that maximize the opportunities for mutual spontaneous learning. (Hargreaves, 2003, p. 9).

From a Marxist critical perspective, C. Stamatis, a Greek scholar, has conceptualised KS as follows:

The conceptual nucleus of a ‘knowledge society’ echoes, in substance, an actual capitalist trend, which is also ratified ideologically. It signifies the use of knowledge as a productive force in labour process under the conditions of late capitalism. The type of education that is cultivated in educational institutions is

accordingly called upon to be adapted to such knowledge use. (Stamatis, 2005, p. 115. Translated from the Greek text)

In the prevalent discourse, the following *epistemic* elements appear to characterise the emerging KS:

- Enormous development of ICTs and sophisticated learning technologies; the rise of what M. Castells has called “Network Society” and the “Information/ Technological Epistemological Paradigm” (Castells, 1998/2000).
- Knowledge as a factor of production; increased importance of information technologies and what D. Guile has called “codified knowledge” (Guile, 2002) for the accumulation of capital and for sustainable development in a competitive global economy.
- Techno-scientific instrumental rationality.
- Knowledge as a trading commercialised commodity.
- Changing forms of organization of living and work: a “learning organization”. (Senge, 1990); a “flexible workforce”, a “knowledge worker” (Drucker, 1994); the “shamrock organization” (Handy, 1989).
- A renegotiation of power among established power formations (e.g., states, markets, civil societies, international organisations).

A ‘Europe of Knowledge’ Through Education and Training

Discourses about KS and about ‘knowledge’ – what it is, what its forms are, and how it is acquired – invariably have included references to education and training and to the sites that have traditionally been responsible for the production, reproduction and dissemination of knowledge, namely, schools, colleges and universities. In the EU texts, a European educational discourse (policy talk and policy practice) is propounded *that* emphasizes the development of “skills” and “competencies” to meet the needs of the Single European Market, and integrated European KS and a European “knowledge-based competitive economy”. Although in some of the texts reference is made to “solid based- broad education”, what is more salient in the EU discourse is the privileging of certain kinds of knowledge, skills and competencies, for example, education in ICTs, techno-scientific instrumental rationality, and vocational skills, for “competitive advantage”, so that, as the Lisbon Council put it in 2000, the EU by 2010, will become “the most competitive and dynamic knowledge economy in the world, capable of sustainable economic growth accompanied by quantitative and qualitative improvement of employment and of greater social cohesion” (Conclusions of the Lisbon Council, 2000). The instrumentalist knowledge bias in the EU’s educational discourse is patently clear in the text *Towards a Europe of Knowledge*, which was issued in 1997. In this text one reads:

Noting that we are entering the ‘knowledge society’, the Commission in its *Agenda 2000* proposes making the policies which drive that society (innovation, research, education and training) one of the four fundamental pillars of the Union’s internal policies...Economic competitiveness, employment and the personal fulfillment of the citizens of Europe is no longer mainly based on the

production of physical goods, nor will it be in the future. Real wealth creation will henceforth be linked to the production and dissemination of knowledge and will depend first and foremost on our efforts in the field of research, education and training and on our capacity to promote innovation. This is why we must fashion a veritable ‘Europe of Knowledge’ (European Commission, 1997).

In the aforementioned widely quoted *Teaching and Learning – Towards a Learning Society* (1995), one gets a clearer picture of the EU’s educational discourse in relation to the European KS and the Europe of Knowledge. This important text pays homage to globalisation, namely, “the internalisation of trade, the global context of technology and above all, the arrival of the [global] information society”. In the global “learning society” of the future, according to it, knowledge and cognitive skills will be of pivotal importance, especially knowledge and skills in techno-science and mathematics, particularly for purposes of economic growth and prosperity. At the same time, however, the White Paper urged that education and training in the “learning society” (also read ‘knowledge society’) should not be narrowly instrumental, but multi-purpose. It should (a) focus on “a broad knowledge base” and emphasise breadth and flexibility rather than narrowness; (b) build bridges between schools and the “business sector”; (c) combat “social exclusion”; (d) develop proficiency in “at least two foreign languages”, that is, in “three Community languages”; and (e) “treat capital investment and investment in training on an equal basis”. The White Paper, further, talked about the importance of “personal development”, the “passing of cultural heritage”, and “the teaching of self-reliance”. Finally, it referred to the development of “human values” and “citizenship” which, according to it, “is essential if European society is to be open, multicultural and democratic” (European Commission, 1995).

However, from a careful reading of this text, it appears that in the envisaged ‘Europe of Knowledge’ greater emphasis and space were placed on the acquisition of certain kinds of knowledge and on the development of cognitive and vocational skills that would be instrumental for the productive employability of the worker, for the accumulation of wealth and economic growth, and for European Union prosperity. In this connection, John Field’s critical comments on the White Paper’s reformist orientation are well taken. “Although the White Paper”, Field has observed, “paid lip-service to the need for personal development and social learning, and even active citizenship, as well as training, there was no sign that the Commission had any concrete proposals in these areas”. In fact, Field has added, “the White Paper simply replicated the established boundary between vocational training and general education” (Field, 1998, p. 75). And, according to J. Spring, even subjects such as literature and philosophy, not to mention science and mathematics were viewed not for “their intrinsic beauty or personal satisfaction”, but for their instrumental value in improving Europe’s position in the global economy” (Spring, 1998, p. 105; also see Grollios, 1999).

The educational discourse that is being promulgated by the European Union for the imagined Europe of Knowledge, may be epitomized in terms of the following key ideas:

- Education and training, instrumental rationality, not *paideia*
- Techno-scientific knowledge/information base, not general/liberal education and humanistic culture/*paideia* (*culture generale, Allgemeine Bildung*)

- Cognitive, vocational, flexible and social skills that are readily assessed and constantly renewable; competitiveness, entrepreneurship, employability, innovation, creativity, productivity, accreditation
- Emphasis on competencies (theoretical, practical, cognitive), mostly instrumental; underemphasis of aesthetic and ethical dispositions and civic virtues – what I would call the *paideia* of the soul

Lastly, it would be pertinent here to refer to A. Hargreaves' astute observations about the contemporary reform discourses on teaching (and education) in the 'knowledge society' and the related 'knowledge-based economy'. Hargreaves argues that contemporary capitalist societies that are also knowledge-based economies serve primarily the private good; their schools are geared to develop primarily cognitive learning, instrumental skills and competencies for a knowledge society and a knowledge economy. But a knowledge-based economy, according to him, is a "force of creative destruction". On the one hand, "it stimulates growth and prosperity", but on the other, "its relentless pursuit of profit and self-interest also strains and fragments the social order". In the knowledge-based economies, school systems "have become obsessed with imposing and micromanaging curriculum uniformity", instead of "fostering creativity and ingenuity". Hargreaves adds:

In place of ambitious missions of compassion and community, schools and teachers have been squeezed into the tunnel vision of test scores, achievement targets and league tables of accountability. And rather than cultivating cosmopolitan identity and the basic emotion of sympathy, which Adam Smith called the emotional foundation of democracy, too many educational systems promote exaggerated and self absorbed senses of national identity. (Hargreaves, 2003, pp. xvi–xvii, 9).

What Knowledge Is of Most Worth? – Looking Backwards into the Future

From the above, it can easily be inferred that the knowledge 'of most value' or 'of most worth' in the late modern globalised European 'Network Society' is different from that of the nineteenth-century industrial Europe of early modernity. In the early modern industrial Europe, the knowledge that was 'of most worth' was what could be called 'liberal humanistic knowledge'. In the contemporary post-industrial information-technological and globalised Europe of late modernity, the knowledge that is 'of most worth' and privileged is 'techno-science' and instrumental rationality. As I argued in another chapter in Section Seven of this Handbook, it appears that neo-liberal globalisation and the "instrumentalist ethos of market fundamentalism", with their emphasis, on instrumental rationality, the production of useful knowledge and what F. Furedi has called "philistine concerns", are having corrosive effects on liberal culture, the arts and "the life of the mind" (Furedi, 2004). Commenting on the European Union's action programmes, namely, SOCRATES, LEONARDO DA VINCI, ERASMUS, ARION

and COMENIUS, Field has noted that they are “relentlessly vocational, utilitarian and instrumental in their emphasis,” a “technological option”, according to him, that has created a tension between “instrumentalism” and the European attachment to the humanistic tradition of education” (Field, 1998, p. 8).

One could speculate that a resurrected Herbert Spencer would in all probability welcome such a swing of the epistemological pendulum from a predominantly ‘humanistic’ and “general type of knowledge to a predominantly techno-scientific, instrumental and pragmatic type. But, in my opinion, a resurrected T. H. Huxley, who also championed scientific education, would not. In the great controversy of the 1860s over what knowledge was of most worth, Huxley warned against “exclusiveness” and imbalance in curriculum studies; for, as he had aptly put it, “the value of the cargo does not compensate for a ship’s being out of trim” (Huxley, 1902, pp. 153–154).

Coda

Recently, Michael Young (1998, 2008), a noted sociologist of the curriculum, and a critic of the contemporary educational trends as they affect educational knowledge and the curriculum, urged that ‘knowledge be brought back in education’, and that a society of the future “embody an education-led economy rather than an economy-led education system”. In another chapter of this Handbook entitled “Agamemnon contra Prometheus: Globalisation, Knowledge/Learning Societies and *Paideia* in the New Cosmopolis”, where I examine critically the negative consequences of “globalisation” on education, I argue for the re-enchantment of “humanistic *paideia*” in the broad meaning of the term, for what I call “Promethean Humanism” that would include “all human arts”, theoretical and practical.

WHAT KNOWLEDGE IS OF MOST WORTH? AN OLD QUESTION REVISITED IN ENGLAND

Denis Lawton

One assumption of this chapter is that education, and especially curriculum, should be examined within a specific location before even modest attempts at generalisation are made. In this paper the focus will be mainly upon England: the recent histories of Wales, Scotland and Ireland differ considerably from that of England. For example, since education policy in Wales was devolved from the UK Parliament to the Welsh National Assembly in the 1990s, much greater priority has been given to ‘Welshness’ in their national curriculum than Englishness in the English national curriculum.

The question ‘what knowledge is of most worth?’ has more usually been taken for granted in England than given specific attention. In England, politicians and other decision-makers, including educationists, have tended to look backwards to justify the curriculum in terms of tradition rather than more fundamental epistemological enquiry. When the question has been specifically addressed it has almost always been due to social pressure of a political or economic kind. These kinds of social change have tended to be of more significance than changes in ideas or educational theory and practice.

One of the best-known publications addressing the question of the worth of knowledge in the school curriculum was made by Herbert Spencer (1820–1903). In his essay ‘Education’ (1861) Spencer made it clear that his reason for questioning the content of the school curriculum was that tremendous social and economic changes had taken place in England in the eighteenth and early nineteenth centuries but these changes had not been reflected sufficiently, if at all, in school curricula. England had pioneered the Industrial Revolution in the eighteenth century which had then produced all kinds of social and economic pressures in the nineteenth century but schools largely ignored those changes. The curriculum of public or independent schools still concentrated very largely on Latin and Greek, perhaps with a little mathematics, when the dominant forms of knowledge were now science and technology.

In the twentieth century the education system, including the curriculum, was re-examined on a number of occasions: the 1902 Education Act and the Secondary Regulations of 1904; the 1944 Education Act; the 1988 National Curriculum, with subsequent additions and modifications up to the end of the century.

A major concern of this chapter is to look at those occasions of curriculum change and to attempt to analyse what social pressure or combination of pressures (economic, political and ideological) have been responsible for the re-examination of the education

system and any changes made to the curriculum. It is also suggested that these social changes have normally taken priority over changes in educational ideas.

The Education Act 1902 and Secondary Regulations 1904

The changes that Spencer was concerned with in the nineteenth century had by the beginning of the twentieth century produced something of a crisis in the availability of educated manpower in England. There was a much greater demand for literate and numerate clerks in the City of London and elsewhere than the school system was producing. Hence, for the first time in England, the government authorised the spending of public money for the purpose of state secondary education (the 1870 Education Act had only sanctioned the spending of public money on elementary schools – secondary education had been specifically excluded). The Balfour Education Act of 1902, accordingly, encouraged Local Education Authorities to use some of their funds to support secondary schools. Soon after the Act, the Board of Education in England produced a set of rules for the secondary curriculum — the Secondary Regulations 1904 — which tightly controlled what could or should be taught. (The notion, sometimes expressed, that there was no control of the curriculum until 1988 is complete nonsense. This is important because from now onwards one pressure on the curriculum was the political concern of the central authority in education to have some control over the content of the curriculum).

These events at the beginning of the twentieth century were not simply a question of the worthwhileness of knowledge but also the extent to which worthwhile knowledge should be shared amongst the whole population. Only a minority of young people aged 11 and over were to be given access to the new secondary curriculum: the vast majority of the age group from 5 to 13 or 14 was to be limited to the elementary school curriculum which consisted very largely of reading, writing, elementary mathematics and religious education. Those drawing up the secondary curriculum were conscious that it was important to preserve the distinction between elementary education for all and secondary education for a selected few who would follow a curriculum similar to that received by those who could afford to pay fees in independent schools. The 1902 Act has sometimes been hailed as a step on the way to education for all, but it was not at this time seen in that way, and could hardly be perceived as democratic in its intention or outcome; probably, quite the reverse.

The 1944 Education Act

In 1944, towards the end of the Second World War when egalitarian views were being expressed by many citizens, there was a much more significant step towards ‘secondary education for all’ when the 1944 Education Act decreed that all children should receive education from 5 to 16, free and compulsory, according to age, aptitude and ability. Once again this was not a complete move into democratic education because the Act was usually interpreted by Local Education Authorities to mean that all children would go to secondary schools but not necessarily to the same secondary schools and certainly not receiving the same access to knowledge. In answering the question ‘What knowledge is of most worth?’ there was still an assumption of differentiation, if

not according to social class then nearly always according to 'ability'. However, at this stage, the question of the content of the curriculum was not specifically mentioned in the Act. Some say that the question was deliberately avoided in order to achieve consensus in Parliament; thus it was left to Local Authorities to decide for themselves rather than being given any kind of direction from the central government. So the Secondary Regulations continued in spirit if not in legislation for those pupils in grammar schools regarded as academic and the Local Authorities allowed other kinds of schools (secondary modern and technical schools) to sort out the curriculum for themselves. Our question about knowledge and worth was answered differently for various social rankings within the community. Even at a time of heightened democratic pressure, the question was not seen as involving equality of access to worthwhile knowledge.

This neglect of a political priority 'secondary education for all' was, however, spotted by an independent, non-governmental group of educationists. A self-appointed group of educational experts formed themselves into the 'Council for Curriculum Reform'. They discussed the whole question of a new curriculum extensively, and eventually produced a very interesting report 'The Content of Education' (1945). This group launched the most intelligent review of the school curriculum available at that time although it received no official backing and in fact relied for its funding on £50 from the Institute of Education and £25 from the London Co-operative Society. Some of the answers that they offered were clearly much too advanced for the government and most Local Authorities at that time, and were not even considered by the new Labour Government in 1945. The proposal of the Council in 1945 was, however, that *all* young people should have access to the following kinds of knowledge: moral and religious education, aesthetic education (including literature and the visual arts), languages (English and foreign), mathematics, natural sciences, social science (social studies, history, economics and politics).

The recommendations of the Council were largely ignored, despite the fact that the question of the organisation of secondary education (but not the curriculum) was discussed frequently over the next 30 years. The debate centred more on the question of school structure (should there be comprehensive schools for all or separate grammar, technical and secondary modern schools according to ability) rather than tackling the more fundamental question of what kinds of knowledge all young people should have access to.

Changes in Educational Ideas: The Philosophical and Sociological Views of Knowledge

Meanwhile, at the University of London, Institute of Education, questions were being asked about 'What knowledge is of most worth?' In the philosophy department R. S. Peters in *Ethics and Education* (1966) had attempted to look at the criteria operating when our question was addressed from a philosophical point of view in the context of evaluating school curricula. Peters expressed dissatisfaction with the Utilitarian answer to our question, namely, 'the greatest happiness of the greatest number'. One of his colleagues, P. H. Hirst, looked at the question of knowledge and schooling and came to the conclusion that many theories of education were incomplete if they did not work out some principles for deciding on which subjects should be taught. He was critical of some

extreme progressive views of education emphasising 'child-centred' curricula and also some ideas about education for autonomy. He asserted that it was no good talking about motivation, for example, whilst ignoring the fact that education is not simply concerned with learning how to learn but must also include ideas about the nature of knowledge and what should be learned. Accordingly, Hirst (1975) distinguished between seven 'forms' of knowledge, which had different key concepts and different kinds of validation procedures and sometimes methods of enquiry. He put this forward as one way of looking critically at existing school curricula. His seven forms of knowledge were: mathematics and formal knowledge; the physical sciences; the human sciences, including history; moral understanding; religion; philosophy; and aesthetics.

A little later D. Lawton (1983), without disparaging the value of his colleagues' philosophical views, suggested that to answer the question of knowledge and worth from the curriculum perspective, it was necessary to go beyond academic knowledge and beyond philosophical linguistic analysis. He suggested that sociological and anthropological approaches to knowledge should also be taken into account. His proposal consisted of two kinds of enquiry: the first being concerned with the human universals which, he suggested, existed in some form in all human societies, and that these human universals gave rise to different kinds of cultural systems involving different kinds of knowledge. Such differences would be more evident in more advanced industrial societies than in simpler, pre-literate communities despite sharing human universals. His second set of propositions was that the human universals could be analysed into distinctive cultural systems each containing different kinds of knowledge which should be used as a basis for curriculum construction. Essentially, his approach recommended that every school curriculum necessarily consisted of some kind of 'selection from the culture' but that many curricula had serious gaps and omissions. As one possible approach to analysing selection from the culture he proposed a number of cultural 'systems' derived from human universals: socio-political, technological, communication, economic, belief, moral, rationality, aesthetic, and physical or maturational. He suggested that these cultural systems could be used not as a basis for a curriculum design, replacing existing school subjects, but as a checklist to make sure that there were no important gaps left in the curriculum. In the case of England, the socio-political, economic and morality systems were strangely neglected or sometimes completely ignored. He recommended using the cultural systems as one side of a matrix, the other axis being existing school subjects. The intersection of these two could provide a means of analysing where knowledge omissions existed and should be filled. Such a matrix would not provide a complete answer to our question but would indicate the first stage of a cultural analysis in the curriculum design procedure.

Kenneth Baker's National Curriculum 1988 and Subsequent Changes

There were few official attempts to answer the question about knowledge and worth from the time of the first Labour Government (1945) until Kenneth Baker and the Thatcherite government put together proposals for a national curriculum in 1988. In 1979 when the

Conservatives came to office they did not initially propose a national curriculum and the second of Thatcher's Education Secretaries, Keith Joseph, was ideologically opposed to the idea, because he believed that schools should decide on their own curricula provided that parents had the right to choose a school for their children. However, his successor, Kenneth Baker, was both more of a moderniser and more of a centralist in education and saw the need to improve the performance of schools by greater control over what they taught. When Kenneth Baker decided that England should come into line with other advanced European countries and develop a national curriculum, he might have looked to his own body of experts, Her Majesty's Inspectors of Schools (HMI), but if he did, his decisions did not show that he had asked the right HMIs. A group of Inspectors had been working for some years on the idea of a common curriculum for secondary schools and had even produced some booklets on the subject and encouraged some schools within a few LEAs to embark upon some experiments along the lines of the model they had developed. Although HMI had not explicitly addressed our question, they put forward some very sensible proposals: making use of the familiar school subjects, but going beyond that traditional approach by emphasising 'areas of knowledge and experience'. Like Lawton, they clearly wanted to move beyond the purely academic subjects of grammar schools and tried to produce a curriculum suitable for all young people – an 'Entitlement Curriculum'. It should be remembered that by then the majority of secondary schools were, officially, comprehensive – that is, all-ability schools. The eight areas of knowledge and experience suggested by HMI were: aesthetic/creative, ethical, linguistic, mathematical, physical, scientific, social/political, and spiritual (HMI, 1983).

It is not clear whether Baker knew about the existence of this HMI, 'Entitlement' model, or of the valuable experimental work undertaken by some secondary schools under the supervision of his Inspectors, or whether he was advised to ignore these innovations. In any case what happened was that his 1988 national curriculum was based purely on a list of conventional school subjects so close to the 1904 Secondary Regulations that many commentators have examined the two lists of subjects side by side; they drew the obvious conclusion that the Baker national curriculum was indeed backward-looking.

1904	1988
English	English
Mathematics	Mathematics
Science	Science
History	History
Geography	Geography
Foreign language	Modern foreign language
Drawing	Art
Physical exercise	Physical education
Manual work/Housewifery	Technology
	Music

See Aldrich (1988) in Lawton and Chitty (1988).

However, the 1904 answer intended for a small percentage of academic pupils was not adequate for a comprehensive curriculum more than 80 years later. In other words, Baker failed to ask the most important question about knowledge, being satisfied with the aim of improving the standards of schools in the pursuit of producing a more competitive manpower for a technological society. It would be unfair to say that he was not interested in the curricular needs of a democratic society, but he did not attempt to include ‘citizenship’ as a new subject although he had earlier – before he was Education Secretary – shown some interest in that development.

So obvious were the gaps in the proposed national curriculum that almost immediately the National Curriculum Council (NCC), a body officially set up to monitor the implementation of the national curriculum, began working on ways of supplementing the list of subjects by means of cross-curricular themes, to include other important educational priorities: for example, environmental studies, citizenship, health education and careers education (none of which had been officially part of the secondary curriculum post-1902).

Thus, hardly had schools got to grips with the new list of subjects in 1988 than they were encouraged to plan their own school curriculum so as to accommodate the other needs identified by the NCC. The Education Secretary had failed to ask the key question about knowledge and worth, but his NCC had seen that an opportunity had been missed. Unfortunately, whereas the national curriculum was mandatory, the NCC additions were only recommendations which could be ignored by schools if they found themselves already preoccupied with the management of the national curriculum.

Changes to the National Curriculum (1990–2000)

As we saw above one intention of the national curriculum was to have ten subjects, three of which were prioritised and that all ten subjects should be assessed regularly and rigorously. It was pointed out on several occasions that had this come about, England would have had the most prescriptive and the most highly assessed curriculum in the world. This was not to be because the teaching profession found the burden of teaching and assessment intolerable. In 1990 the retreat from the ten subject content began. First, subjects were pruned but when this reduction proved to be insufficient, the subjects themselves were gradually cut down so that eventually all that remained was the area of core subjects, namely, English, mathematics and science, plus religious education which was taken much less seriously. While this was happening the prospect of adding further material to the national curriculum in the form of the NCC cross-curricular knowledge was extremely unlikely, however much individual schools might have regarded such cross-curricular knowledge as worthwhile. It will not be necessary to go into detail about the retreat from the total Baker national curriculum to a slimmed-down version over the next 10 years. All that remained of the compulsory national curriculum for the 14–16 age group was the three core subjects and even they were reduced in content.

Without asking the question explicitly, the central authority in education had arrived at an answer that by the year 2000 the school knowledge that was considered of most worth was English, mathematics and science. But by the beginning of the new century a new subject was added to the compulsory national curriculum – education for citizenship.

The ‘Education for Citizenship’ Curriculum

During the 1990s, along with the reduction of emphasis on the non-core curricular subjects, one additional subject was emerging as ‘worthwhile knowledge’. The Conservative Party had remained in government from 1979 to 1997 when the Labour Party under Tony Blair emerged with a landslide majority. Given that Blair’s slogan was ‘education, education, education’ it might have been expected that a review of curriculum content would have been undertaken as part of a new vision. It was not. In education policy, as in many other respects, Blair was content to carry on with Thatcherite measures but pursued, he hoped, with greater efficiency and sometimes more money.

There was one exception to that general rule: the question of educating young people for democracy – a new subject ‘education for citizenship’ which was to be given high status by being compulsory for all in secondary schools and with some preparatory work in primary schools. This would indicate that someone in the government thought that this was knowledge of considerable worth. And it must have been backed by other members of the Labour Party and some in other Parties.

Several efforts had been made throughout the twentieth century to include citizenship or political education as part of the school curriculum. One problem was that even for those who regarded this knowledge as worthwhile it was, or might be, dangerous: ‘high risk – low pay-off’. One long-term advocate of the teaching of politics in schools was a professor of Politics at the University of London, Bernard Crick, who had worked in various ways to promote the idea of serious teaching of citizenship in the secondary school curriculum. Politics had been an optional subject for school-leaving examinations at 16 and 18, but Crick wanted the subject compulsory for all. The story of how he attempted to persuade educationists and politicians over a period of about 30 years that this knowledge was not only worthwhile but vital for democracy, is an interesting one which cannot be recounted in detail here. Crick had been involved in a variety of projects, notably one supported by the very respectable Hansard Society, which published ideas about ‘political literacy’ in schools in the 1970s. Nothing came of any of this during the Thatcher era, despite the tacit support of Kenneth Baker, and it was only with the change of government in 1997 that a serious project became official policy. One of Blair’s most ardent supporters was David Blunkett, who became Education Secretary in 1997. Much earlier, Blunkett had been one of Crick’s students and had been impressed by his ideas. He persuaded Blair to appoint Crick as Chairman of a Committee given the task of making recommendations for ‘education for citizenship’. The proposals were extensively discussed during a consultation period, and eventually passed into law as part of the national curriculum in the new millennium. All Party support was obtained.

The reason why political education became ‘worthwhile’ at the end of the twentieth century in England was that politicians as well as educationists, were worried by the fact that young people were extremely ignorant about this aspect of their own society, and secondly, that politicians in particular were worried about the low percentage of young people voting in general and local elections – especially the 18–30 age group and this was thought to be the result of ignorance and apathy rather than political sophistication.

At the turn of the century, as far as England was concerned, worthwhile knowledge consisted largely of English, mathematics, science and political education. Religious education was officially a requirement but did not carry the same kind of importance as the other compulsory subjects. This order of priorities was the result of, as we have seen, social and political pressures. But since the 1970s in England the major influence in education was economic: the need for better-skilled and better-educated workers associated with the desire to compete more efficiently with our industrial and commercial competitors.

What Knowledge Is of Most Worth — In the Twenty-First Century?

In the last section we gave the immediate answer to that question, but it is also important to have some concern for longer-term priorities in terms of knowledge and worth. What had not been seriously attempted, publicly, in the twentieth century, was the question, what else matters – what concerns, other than economic, should be reflected in the curriculum?

Educationists, including HMI, have from time to time voiced their concern about the lack of attention paid in primary schools, for example, to art, music and literature, and in secondary schools have bewailed the fact that few young people now continue to study such subjects as history and modern languages after age 14, when such subjects become optional. Any kind of cultural analysis has to address another question as well as what knowledge is of most worth, that is, the general purpose of education. And if it is the case that one important purpose of education is to pass on a selection from the culture in terms of what is regarded as of most worth, some attention has also to be paid to the question of balance. In other words, is the selection from the culture a balanced one? It is not enough for a young person to be educated in those kinds of knowledge which will enable him to earn a living; there are other requirements as well. For example, the kinds of knowledge that enable the young person to develop as an individual, such as the aesthetic subjects, or kinds of knowledge which make the individual a better contributor to society apart from citizenship; this would include such kinds of knowledge as the belief system, the morality system and the maturation system. All of which are comparatively neglected in most secondary schools. The immediate prospect for secondary schools in general having a balanced and worthwhile curriculum is, therefore, not good; we still need a thorough analysis of what constitutes a worthwhile education for all young people.

Summary and Conclusions

It is clear that the question enshrined in the title of this chapter cannot expect an answer which will be absolute, either in terms of time or place. Priorities will change from time to time and from place to place according to the social, political and technological pressures in a specific society. The best that educationists can do by means of cultural analysis is to settle for the parameters that should guide the selection from culture and

to point out when some forms of worthwhile knowledge have been neglected in the pursuit of more immediate priorities. If we go back far enough in our history – beyond the limits of our chapter title – the answer to our question might well have been theological knowledge. In the Middle Ages, theology was certainly ‘queen of the sciences’. After the Renaissance and Reformation, however, Latin and Greek history and literature became the knowledge regarded as worthy of the educated gentleman. Later, after the Enlightenment in the eighteenth century and then the industrial revolution, science and mathematics began to gain priority – more relevant in the modern world than Latin and Greek. Schools were sometimes slow to adjust to these social changes, but eventually the pressures on the curriculum were strong enough to ensure change.

Within the bounds of this chapter, that is, the twentieth century, we have looked at a number of political events in the history of education and tried to see what changes occurred and what social pressures brought them about. The extension of educational opportunity in 1902 was a mixture of demands for educated manpower as well as a reluctant acceptance of the need for a better-educated electorate. Even partial democracy strengthened the case for greater access to worthwhile knowledge. By 1944, secondary education for all was seen as an important principle due largely to the egalitarian changes brought about by the Second World War. But the chance was missed at that time of asking fundamental questions about what kind of education and therefore what kind of knowledge should be made available for all young people. After that, economic pressures, especially the demand for more skilled manpower, grew to such an extent that a common attitude to education was that its main purpose was ‘training for employment’. This philistine outlook was emphasised during the Conservative years 1979–1997, and contrary to the hopes of many in education, was continued under the Blair regime after 1997. The exception was the greater value that was placed on political education at the end of the twentieth century. It remains to be seen what will happen in the twenty-first century. Throughout the twentieth century it was often assumed and sometimes even explicitly stated, that a problem of knowledge and the curriculum could be seen in terms of a ‘common culture’. In the twenty-first century, this is unlikely to be an acceptable policy. England is now a pluralist society with strong cultural minorities. The most problematic of those is a large number of Moslem citizens (and perhaps non-citizens), who not only wish to retain their own belief system, but have also begun to demand their own morality system, their own language and their own schools. How to cope with that kind of pluralism is likely to be a major problem for some years to come.

THE ENLIGHTENMENT AND RELIGION, KNOWLEDGE AND PEDAGOGIES IN EUROPE

Thyge Winther-Jensen

The last half of the eighteenth century is the period in European history which is normally known as the age of Enlightenment. The sources of this movement were tendencies which had already made themselves felt in the seventeenth century. John Locke (1632–1704), the English philosopher, had followed the tradition from Francis Bacon (1561–1626) by focusing on experience, particularly sense experience, as the foundation of human cognition. And rationalist philosophers like Descartes (1596–1650), Spinoza (1632–1677) and Leibniz (1646–1716) had supported the belief that it was rationally possible to solve the essential problems of human life. Both movements, empiricism and rationalism, were combined towards the end of the eighteenth century in a demand for enlightenment. The demand was based on a changed view on nature, society, and the human being. But it also influenced the view on education which itself was transformed and at the same time awarded a prominent role in the transmission of the new ideas. From now on education was seen as an activity which should be carried out independent of the church and serve only a secular society based on rational science, democracy and human rights (Grue-Sørensen, 1972; Winther-Jensen, 2004).

The society which gave rise to the Enlightenment was characterised by absolute monarchy. The social upheavals following the Renaissance and the Reformation had strengthened the power of kings and princes as both the Papacy and the Protestants needed them to fight each other. In the northern European Protestant countries, the king had been appointed supreme bishop and he had at the same time taken possession of church property. This was not the case in the southern European Catholic countries, but the Catholic Church needed assistance to fight against heresy in order to prevent the ideas of the Reformation from spreading further. Consequently, the church ended up being heavily dependent on the worldly powers. Only England avoided this concentration of absolute power, mainly because of inter-religious rivalry.

But the creation of absolute monarchies with supreme power in the hands of one person did not bring about the liberation of the individual which had prompted the creators of the Renaissance. One master – the church – had been replaced by another – the king – and the new master was as strict as the old one. Even though the medieval Christian teaching of equality and the Renaissance demand for individual liberty had prepared the ground for a different concept of what it was to be human it was

necessary to go back to pre-medieval times, to the Roman emperors, to find a similar concentration of power.

Everywhere a strict regulation of society was carried out by the monarch and the privileged classes, and everywhere the church, more or less reluctantly, blessed the absolute kings and princes. The alliance between the worldly and the clerical authorities appeared to be an invincible fortress, which on one hand made society safe, but on the other, kept it in fetters (Barth, 1925).

The ideas which in the long term would contribute to the breaking down of that fortress, however, had for a long time been on the drawing board under the unifying term 'The principle of Nature'. The last part of the eighteenth century is characterised by the fact that this principle is widely employed in the fields of thinking and in society. The principle was to become an important means in the struggle for more liberal enterprise for the individual and for society.

The Principle of Nature

Behind the principle of nature were a number of ideas with the mutual aim of creating a new basis for human thinking and cognition. Instead of the 'light of revelation' as the foundation for cognition there was to be the 'light of nature', that is, reason. 'Natural' was all that was left when the parts which could not stand up to a more thorough examination from human experience and reason had been cut away.

It began with the development of a so-called 'natural' religion. With the rediscovery in the Renaissance of the ancient philosophers it was revealed that many of the 'truths' which so far had only been revealed to us through Christ in the Gospels could also be found in the ancient philosophers. In Plato, and later on, the Stoics, the concept of one god was already active. In the work of the Roman philosopher Seneca the concept of the immortal soul was described vividly.¹ And the idea of Doomsday could be found in Plato's *Republic* (Plato, *Republic*, book X).

With the 'natural' religion eighteenth-century thinkers believed that they had created a religion which not only might help to reform the existing church, but would also bridge the different branches of the Christian faith.

But the principle of nature also became active and powerful in other fields of intellectual life. The name as well as the concept of natural law was already known from the classical concept of natural right, for example, with the Stoics, among others. It considered human reason as part of the universal divine reason. Natural right was consequently not the right of the strong, but a right based on universal equality and a universal personal liberty (Grotius, 2005). This concept was seized upon by all the great personalities of that age. John Locke, for example, compared natural law with the rational right wished by God (Locke, 2003; Russell, 1993, p. 603). Natural law gained substantial political importance, partly in the struggle for an improved state of law and partly in the designing of what later would be known as human rights. Locke (1964), in *Some thoughts concerning education*, advocated an upbringing based on natural principles. He spoke against an education through general rules and commands imposed on the child from outside and maintained through rewards and

punishments. Instead he recommended a character training matching the aptitude and nature of children.

An even more revolutionary use of the principle of nature was applied in the field of national economy. In his pioneering work, *Wealth of Nations*, 1776, the Scottish economist Adam Smith advocated 'natural freedom' as a principle when running the economy of countries. He strongly criticised the mercantile system and demanded that the state interfered as little as possible in the actions of the citizens, economic or otherwise. If only the economic forces were subjected to a free market in which the law of supply and demand had a free hand it would, like 'an invisible hand', regulate the economic forces to the good of the individual within a community as well as among nations (Smith, 1962).

The reduction of the religious contents in what stood up to the examination of experience and reason also gained importance in the field of ethics. The English philosopher A. C. Shaftesbury (1671–1713) claimed, in contrast to his master Locke, that ethics was independent of theology and that humans had a number of innate 'natural' moral urges which formed the basis for morality, the so-called moral-sense theory. Consequently, the age of Enlightenment contained a heavily moral, if not moralising, element.

Education would be another example. The principle had been in embryo with earlier thinkers like Montaigne (1533–1592). And in 1613 the German 'didacticus', Ratichius had asserted *Omnia juxta methodum naturae*, that is, all according to the method of nature, which to him meant, among other things, that learning your mother tongue should have priority over learning Latin (Vogt, 1894; Linderstrøm-Lang, 1903). Also the Czech educator, Comenius (1592–1670), who was influenced by Ratichius, included the principle of nature in his teachings (Comenius, 1910). However, it was Jean Jacques Rousseau (1712–1778) who in *Emile* really established the principle in the educational field and who furthermore added a number of new dimensions (*Emile*, OC, vol. 4).

The Enlightenment View of Human Nature

One characteristic of man is that he explains and interprets himself, which again implies that he decides himself in whose picture he wants to form himself. While animals are born almost 'fully fledged', that is, with the capabilities and skills necessary to survive in their particular environment, but on the other hand disappear if this environment changes radically, man is capable of, through his formidable capacity for learning, adapting to all kinds of environments. Not only can he adapt to the physical or technological environment he is placed in, but he also has the capacity, through active learning, to form himself as a human being in harmony with the values on which his community is based (Winther-Jensen, 2004).

To throw light on the consequences of the human concept which stemmed from the Enlightenment it is useful to look at the previous period by considering some of the most influential views of human nature caused by penetrating spiritual and cultural upheavals.

The Classical View

According to the German philosopher Ernst Cassirer, the Greeks were the first to ask the question: What is man? In the pre-Socratic stages Greek philosophy was mainly concerned about the physical universe: cosmology overshadowed all other philosophical studies. Only Heraclitus was on the borderline between cosmological and philosophical-anthropological thinking. But Greek anthropology did not reach its zenith until Socrates. “Thus it is”, says Cassirer, “in the problem of man we find the landmark separating Socratic from pre-Socratic thought” (Cassirer, 1963, p. 4). Socrates’ entire search is aimed at the human existence. It is characteristic, however, that even though Socrates in all Plato’s dialogues analyses and discusses human qualities he never gives us a direct definition of man. Physical objects can be described through their positive qualities, but man can only be understood through his consciousness. Only through conversation – dialogue – is it possible to gain an insight into the very essence of man (Cassirer, 1963).

In Socrates’ and Plato’s preference for a pedagogy centred in dialectics and dialogue they used the analogy as a necessary method to examine the new problem they were facing: what is man? (Plato, *Republic*, book VII). When in the *Republic* Socrates is asked to define ‘a just man’ he does so indirectly by describing the just society and thus makes it possible here to read in capital letters what in man is written in small.

The classical Greek image of man is therefore a human being seeking to find himself through mutual questions and answers. It is a fundamental capacity in man that he is supporting himself by an unwavering faith in reason as the key tool available to him. It was this tool which Plato wanted to elevate to a supreme position in the lives of the community and the individual.

The Christian View

The classical human concept was carried on by the Stoics, but with the emergence of Christianity it was opposed by a new and powerful concept which added new dimensions. The Christian concept was particularly expressed in St. Augustine (354–430), a teacher of rhetoric and an admirer of Plato. As a Christian thinker, he criticised ancient philosophy for its optimistic belief in reason as the ruling principle in human affairs. With St. Augustine the biblical concept of human reason was introduced in Western culture. The classical concept of reason cannot be maintained, according to St. Augustine. It can only be saved through holy grace. Since the Fall, sin has become a fundamental feature in man. According to Cassirer: “Here, (i.e. in Augustine) we have come to a complete reversal of all the values upheld by Greek philosophy. What once seemed to be the highest privilege of man proves to be his peril and temptation; what appeared as his pride becomes his deepest humiliation” (Cassirer, 1963, p. 10). The encounter of the classical and the Christian concept can be traced right up to the seventeenth century. Comenius, for example, was indebted to Greek philosophy in spite of his Christian outlook. But in a less dogmatic way he placed education and enlightenment as a human-made means to give back to reason its original pure being (Winther-Jensen, 2004). Even though he at no time neglects to emphasise the importance of Revelation for the salvation of reason he became nevertheless with his universal educational ideal

– to teach all everything – a Christian example of what worldly means alone can do to save ‘reason’ about which Augustine was so suspicious.

The Rationalist View

In the wake of the Renaissance a new conflict between a Christian and a secularised concept of human reason began. The new concept was primarily a consequence of the so-called ‘new science’ announced by Francis Bacon (1561–1626) in *Novum Organum* (1620) and developed further in the fertile spiritual climate during and after the Renaissance.

Crucial for this new concept was Nicolaus Copernicus’ (1473–1543) discovery of the heliocentric system which launched human reason into a new crisis. The basic concept, up to then, that man was the centre of the universe, was abruptly ripped away. Man was now placed in infinite space. All at once human reason reduced man to an infinitesimal dot in an infinite universe (Landmann, 1964).

The Copernican picture of the universe meant a dethronement of human reason. It was no longer to be found in a hierarchical system ranked only second to God as the mediaeval line of thought had mainly emphasised. But it also gave ‘reason’ new challenges. By means of its new tool, science, it was given the new task to turn this apparent weakness into new strength.

The combined efforts of the seventeenth-century rationalist philosophers and scientists were needed, to overcome this new crisis in human self-perception, caused by the Copernican world system. People like Bruno, Descartes, Spinoza, Newton, Leibnitz and Galileo, each contributed to the solution of the problem, and their chosen means was *mathematics*. Mathematical reason became the bond between man and universe and mathematical thinking became the means to comprehend the cosmic and moral order. Humans had been forced to consider themselves as logical and rational beings who increasingly found support in the new science rather than in godly powers. Understandably enough, the relation between belief and knowledge became one of the key issues in the seventeenth century.

The Enlightenment View

These views about man, built up over time, were crystallised during the Enlightenment, into a new idea of man. The Copernican world picture had triumphed and the world was no longer a universe pervaded by God, but rather a machine regulated according to rational, that is, natural principles. God was only the initiator of the machinery. Human beings were looked upon as machines to be taken care of and to be regulated according to rational principles. To La Mettrie (1709–1751), author of the work *L’homme machine* (La Mettrie, 1996), education became a question of keeping the machine in good order and to add to it a big and carefully chosen range of sensations.

This kind of rationalistic thinking culminated during the Enlightenment and, at the same time, fused with empiricism. John Locke, whose thoughts had been introduced to the French philosophers of Enlightenment by Voltaire (1694–1778), considered conscious mental life as a product of the sensations reached through our senses. His *tabula rasa* theory which, however, also contained the idea of inner sensations and reflection,

emphasised that all spiritual powers develop through the senses, the only source of cognition. This is a prominent view in Condillac, for example (Condillac, 1984).

But both Locke and the French theorists, in contrast to the rationalists, considered experience to be the real source for our knowledge and denied all so-called a priori or innate factors. This concept necessarily had to ascribe greater importance than hitherto to education. “Poor education, few ideas” La Mettrie claimed, among others (Grue-Sørensen, 1972). It goes without saying that no religious ideas, but only rational ideas which could be the object of empirical experience, were allowed in such a programme.

It follows from this, that the Enlightenment was also a secular movement. The new science, for which the foundation was laid during the Renaissance, was meant to replace the church as an organiser of society and human relations. Worshipping was a personal affair that could take place irrespective of the church, and public institutions, including educational institutions, should no longer be subject to clerical supervision. Above all, human beings themselves were to be considered as products of their own personal endowments and individualities. This concept of what it was to be human had a crucial influence on educational theory, but it needed Rousseau’s eloquence before it was finally accepted.

Jean-Jacques Rousseau

Rousseau is, on the one hand, a representative of the age of Enlightenment, but on the other, not quite typical. In his treatise *Discours sur les sciences et les arts* (OC, vol. 3, org. 1792) he strikes the theme which later becomes dominant in his work: precedence of nature and what is natural over art and artificiality. His works might fall into two parts. In the first part, which includes *Du contrat social ou principes du droit politique* (OC, vol.3, org. 1762), *De l’économie politique* (OC, vol. 3, org. 1755), and *Considérations sur le gouvernement de Pologne et sur sa réformation projetée* (OC, vol. 3, org. 1772), he confronts existing social conditions with ideal demands for a different and better society. As far as education is mentioned it assumes the character of what we today would call a conforming, patriotic mass education in order to create and preserve an ideal society. This goes for *Considérations*, in particular.

In the second part, which apart from his classic educational/pedagogical ‘novel’ *Emile ou de l’Education* (OC, vol. 4, org. 1762) includes the second *Discours sur l’origine et les fondaments de l’inégalité parmi les hommes* (OC, vol. 3, org. 1755) and *La nouvelle Héloïse* (OC, vol. 3, org. 1761), the emphasis on society as a theme is less. In the *Second Discours* a paradisaical natural condition is praised. In *La nouvelle Héloïse*, family and family-based education in rural and idyllic surroundings are extolled, but in *Emile* too, society is kept at bay, at any rate for the first 15 years of Emile’s life. “How to live a human life”, it says, “is what I want him to learn. When he leaves me, he is – I admit that – neither, soldier, judge, nor priest; he is above all a human being” (OC, vol. 4, *Emile*, book 1). Man should be prepared for the fact that life only in rare moments will be ideal. Therefore, he must be educated to trust his own actions, experiences and thinking. This is the basic attitude in *Emile*.

In his works as a whole all the themes set out in the above are played through each in their own way. Among those the concept of *equality* is very dominant. In *Contrat*

social he combines the reform ideas in the two *Discours* into a radical political system which almost corresponds to direct democracy. The state was originally created on the basis of a social pact which everybody has subscribed to. Equality and personal freedom are considered to be ‘natural’ freedoms. Sovereignty lies with the people and cannot be disposed of or shared. The real ruler in the state is ‘the general will’ which absorbs the individual will. The law is an expression for the ‘general will’ and the people must convene regularly to give laws. The book became a bible for the men behind the French revolution and remains to this day, together with *De l’Esprit des lois* by Montesquieu (Montesquieu, 1949–1956), one of the most important documents from the Enlightenment in the development of modern democracy.

Contrat social contains no special emphasis on education, but the planned chapter on education appeared some years later as *Considérations*. In this Rousseau tries his hand at lawgiving, urged by a Polish patriot. The abstract state of *Contrat social* has now been replaced by the concrete fatherland or nation. In this treatise he ushers in the awakening European nationalism. The aim for education is now not only the republican or citizen of *Contrat social*, but the patriot who, for better or worse, has drunk in with his mother’s milk a passionate love for his fatherland. All means are used to further this attitude. For example, texts which are to be read must have patriotic contents which emphasise physical education with public and obligatory games and exercises, public competitions and a solemn awarding of prizes.

Further, in his works we see the concept of *reason* in the light of a new myth of the Fall of Man which in his version is secular and not religious. The Christian themes of stages of paradise, of sin and of grace are repeated in Rousseau with a secular emphasis: original natural stage, stage of culture, and a recreated stage according to the principles of nature. In Rousseau it is not the stage of sin, but the stage of culture which has corrupted and blurred human reason. The means of penance which must bring about recovery is not holy grace but a new education according with the principles of nature. This was the new and revolutionary education he described in *Emile*. In this he is in line with the philosophers of the Enlightenment when he demands that using the senses should be a central part of the new education. Reason was not – as in Plato – an innate quality characterising man from birth, but something which is gradually created through sense impressions, not through formal exercises, but through individually chosen activities in natural and realistic situations. Intellectual education through reading of books should be postponed until *Emile* is able to realise its usefulness. “Exercise his body, his limbs, his senses, his strength, but keep his mind idle as long as you can. Distrust all opinions which appear before the judgement to discriminate between them. Restrain and ward off strange impressions; and to prevent the birth of evil do not hasten to do well, for goodness is only possible when enlightened by reason” (OC, vol. 4, *Emile*, book 2).

With Rousseau, Plato’s thinking man is substituted with a *sensing* man. In this he agrees with the philosophers of enlightenment, but he differs from them by also pointing at *feeling* as an innate human quality. The strong emphasis on feeling which is so characteristic of Rousseau’s entire works is also a fundamental trait in his understanding of human beings. He considered feeling to be more original, valuable and ‘natural’ than reason and moved focus in our culture from reason, where it had been since Plato,

towards feeling. “Even though Spinoza, Shaftesbury, Hutcheson, and Hume were his predecessors it is due to him that feeling has been recognized as an independent and particular feature in spiritual life ... (feeling) gives us our real merit: We are small in knowledge, but big in feelings” (Høffding, 1896, p. 101).

Man’s most fundamental trait he sees as his need to love himself. “Self-preparation requires, therefore, that we shall love ourselves; we must love ourselves above everything, and it follows directly from this that we love what contributes to our preservation” (OC, vol. 4, *Emile*, book 4). From self-love stems not only natural, human feelings like compassion, love for human beings, the religious feeling, but also fantasy and imagination.

His emphasis on feelings was without doubt contributory to the fact that he found himself in conflict with Diderot and the circle around *The Great Encyclopedia* (1755); they were all seized with – and, to a large extent, creators of – the spirit of rational enlightenment of the age. It was also due to his emphasis on feelings that posterity remembered him more as a forerunner of Romanticism than as a genuine representative of the Enlightenment.

The emphasis on feeling was also to influence his view on religion. The treatise *The Creed of a Savoyard Priest* which is included in *Emile* and rightly considered to be among the most beautiful he has written proves him to be a strongly religious person who may have taken up the “natural” religion of the age, but who at the same time bases it more on a subjective feeling than reason. (OC, vol. 4, *Emile*, book 4). The statement clearly indicates that the church no longer was needed as an intermediary between man and deity.

With the ideas presented by Rousseau and the philosophers of the Enlightenment the notion of education was changed forever: from a forming from the outside to a development from the inside of innate, ‘natural’ capabilities, from a curriculum based on bookish learning to an activity-oriented curriculum, and from a notion of knowledge as a product of deductive, rational thinking to a product of personal experience. The ideas became core elements in the educational reform movements that swept over Europe in the nineteenth and twentieth centuries and they are also recognisable in the American progressive movement. Although John Dewey (1859–1952) criticised Rousseau for elevating nature to a deity, many of Rousseau’s notions on education and knowledge are repeated in his pragmatic, child-oriented curriculum: the emphasis on growth, on problem-solving, on experience, and on activity-oriented teaching methods (Dewey, 1916, *Democracy and education*, MW 9). Especially Rousseau’s ideas gained their strongest foothold in the northern Protestant part of Europe (Germany and Scandinavia). His influence was less in the southern Catholic oriented part of Europe. This observation inevitably draws attention to the way in which the relation between state and church was dealt with during the Enlightenment.

State and Church

In the European Enlightenment you meet for the first time in history a concept of state which does not build on a religious ideology, but which constructs the state as a purely secular arrangement without divine authority or sanctions. But the path towards this concept had been long.

In 311 the Roman emperor gave up his struggle against the Christians and the following year Constantine the Great could appoint himself Emperor. Therefore, in 380 the government could officially offer its protection to all who followed the apostle Peter's creed, that is, Rome's, and denounce the adherents of different creeds as heretics. From that moment you can talk of a Christian state church – though not in a modern sense (Lindhardt, 1961). The theoretical argument was given by Augustine: God's state came to rule on earth, and did so through two regimes: the state as ruler of the earthly life and the church of the divine. Both were equal, but their fields were different (Augustinus, 1957–1972).

In the eastern Byzantine world this transition happened fairly easily. State and church merged totally. In the West it looked different as it proved very difficult in practice to define the limits between the two regimes. The Middle Ages were consequently characterised by severe struggles between church and state with the result that papal victory in the Middle Ages was turned into defeat when the national states came into existence and, through reformatory movements, led to rupture of the medieval church unity.

After the Reformation the states consolidated themselves with their state churches. In the Roman countries the Roman church kept its influence and remained a state religion, but in northern Europe the different national states allied themselves with mainly three reformatory types of churches, Lutheran, Calvinist or Anglican, and in 1555 in Augsburg in Germany the territorial system was phrased, which in practice became valid in all Europe. *Cujus regio, ejus religio*, that is, the political power decides the religion of the country (Bergmann, 1965–1972, vol. 2, p. 48). This was in harmony with the tendency of the times for Absolutism, and the church in all its forms considered it to be a natural task to state a dogmatic and biblical reason for the God given right of Absolutism.

But a state church often means coercion. Those whose beliefs did not coincide with those of the people in power had to escape and in America there was room for all. So here convened all those who had been persecuted in their home countries and when the North American free states broke away from Europe and created their own constitution – written by people with painful experiences of religious intolerance – built in the precondition that state and church must be independent of each other and that religious freedom was a human right and a principle of society" (Lindhardt, 1961).

This proclamation of human rights quickly reflected back on Europe. To the French democrats the existing alliance between royal power and papacy in France was the real enemy; the state only had their political interest; if the church was to exist it had to be in the form of an association of religiously like-minded people. As a consequence of this, the church programme of modern democracy was clearly expressed in two sentences: "Religion is a private matter, and as a consequence state and church must be separated" (Lindhardt, 1961, p. 46).

The new programme necessarily had consequences in the field of education. Following the age of Enlightenment the development moved towards even more separation between school and church, but with different speeds from state to state and slower than one should immediately think. Most radically they set about it in France with the Jules Ferry laws (1879). In this connection church and state had diverging

opinions, but the new school was altogether a state school (the *laïcité* principle). In order to emphasise this, religious instruction was abolished in public schools; it had to be a matter for homes and churches only. They were, however, so accommodating that one weekly day was free for religious instruction to be given outside the schools. Moreover, private schools, mainly Catholic, were allowed to give the religious instruction they wanted. The rules are still valid today and still cause frictions.

In contrast, England maintained religious instruction in the schools, according to the 1944 law, as the only compulsory subject. The Scandinavian schools also kept the religious instruction, but the clerical supervision of the schools was abolished in the first half of this century (in Denmark from the mid-1930s, when the vicar stopped being *ex-officio* chairman of the education committee).

If the principle of separation of church and state is carried out the problem seems to appear in a new disguise somewhere else. The USA can serve as an example. Although, from a *formal* point of view, there is no contact here between church and state, the contact is nevertheless widespread in practice. The state opens its festivities with religious ceremonies and its representatives must be very careful not to express themselves in such a way that one or more religious communities will take offence. More than 300 religious communities are reflected in the amount of private, clerical educational institutions (Lindhardt, 1961, p. 49). The complexity of the church–state issue in the USA has been manifested since the establishment of a free and universal system of public education in the nineteenth century and has been especially salient in the second half of the twentieth century. The central issue has been the meaning of the prohibitions that were set forth in the First Amendment of the Constitution, the so-called Establishment Clause which reads as follows: “Congress shall make no law respecting the establishment of religion, or prohibiting the free exercise thereof”. With the establishment of a public and state-funded educational system in the nineteenth century, one that would serve all classes and diverse religious groups, education became the site of the controversy regarding the constitutionality of (a) state aid to religious schools, and (b) religious instruction and other religious practices in public schools.

As to the former issue, the Supreme Court, which decides on such aspects of schooling when cases are brought before it, has decided that free school textbooks and lunches, auxiliary services such as public transportation, and public welfare benefits such as medical and dental services, for children who attended non-public schools did not violate the First Amendment of the US Constitution, that in Jefferson’s words established a “wall of separation” between church and state. Such benefits, according to the courts, did not imply public support of religious schools; based on the “child welfare theory” it was support of the children who attended such schools (Kliebard, 1968, p. 313).

The second issue, namely, religious instruction and other religious practices in the public/state schools, has taken several forms and continues to be problematic. The following Supreme Court cases involving the constitutionality of religious instruction and other religious practices in the public schools illustrate the complexity of this issue:

- a. In the state of Illinois (*McCollum v. Board of Education*, 1948), conducting classes in religion on school grounds, even by non-sectarian groups, has been judged to be unconstitutional (Kliebard, 1968, p. 313).

- b. In a celebrated “school-prayer” case in the state of New York, the Supreme Court decided that the daily recitation of a non-sectarian prayer in the public school system of the state was unconstitutional. The prayer read: “Almighty God, we acknowledge our dependence upon Thee, and we beg Thy blessings upon us, our parents, our teachers and our country”.
- c. In Pennsylvania (*Abington School District v. Schempp*), the reading of ten verses from the Bible, without any comment, at the beginning of each school day, was judged to involve the establishment of religion by the state, even though “the verses were to be read without comment, and any child could be excused from reading the verses or attending the Bible reading, upon the written request of the parents or guardians” (Spring, 2002, p. 262).

On the one hand, it is probable that the principle of a separation between church and state will go from strength to strength especially because of the increasing mixture of representatives of different religions in the European societies. On the other hand, history teaches us that religion and politics – that is, church and state – to a certain extent are inseparable and always will be related to one another in some form. But the whole problem deserves thorough comparative research. Lately the problem has appeared again in the question of whether the new EU constitution should contain a reference to the fact that Christianity is the basis for European civilisation.

Conclusion

The ideas and thoughts characteristic for the age of the Enlightenment are the result of developments that reach further back in time. Currently, there is increased interest which stems from the fact that new positions were taken on a number of inherited fundamental and principal questions about man, nature, society and education, which to a great extent also govern the way we organise our lives today; some would even suggest that we still live in the age of Enlightenment. For one thing the consequences of the scientific conquests and man’s new position in a world kept in balance by mathematical laws were realised. Even though faith in human reason was unabated, it was given a new interpretation. It was no more only considered to be an innate capacity in man, but also to be something which to a high degree is gradually built up through our senses. The idea that there is nothing in our minds which had not previously been in our senses had consequences for our concept of knowledge and its nature. Though knowledge was still considered an important product of reasoning sense experiences were from now on nonetheless regarded as a *sine qua non*. Locke’s empiricism and French sensualism left distinct marks on the educational thinking.

Rousseau deserves particular mentioning. On the one hand, he is a child of the Enlightenment. This made him an early forerunner of European reform of education. On the other hand, he distinguishes himself from it through his strong emphasis on feeling. This same emphasis also made him a forerunner of later romanticism and national movements.

The relationship between church and state was examined. The emergence of the modern liberal democratic nation state with its emphasis on freedom and equality necessarily led to confrontations with the church. The church was on the defensive and the concept of state, its role and function, were emphasised instead. This led to a demand for the separation of the state from the church. In other words, the foundation of the modern democratic state was laid and education was intended to play an important role in the new modernity project. When the nation states were created during the nineteenth century the educational ideas of the project became fused with the ideas of national navigators into different European traditions of education: French encyclopedism (Descartes), English humanism (Locke), North European naturalism (Décroly, Grundtvig, Kerschensteiner, etc.). This might not have been intended by the original representatives of the Enlightenment. They had a far more cosmopolitan approach.

Epilogue

But this approach might still be active. In the comparative literature you sometimes come across the concept, 'world system' which implies that certain demands on education become generally accepted across cultures and national borders (Boli et al., 1985). The explanation to this phenomenon is that the ideas which originated from the Enlightenment resulted in a new educational model which gradually became the foundation of European education. The model is characterised by a rational and secularised institutional structure, compulsory schooling and is based on values such as respect for the individual, religious tolerance, democracy and human rights. Apparently it has succeeded in establishing itself politically to such a degree – not least through the international organisations – that it makes sense to talk about a surprising universal uniformity along the lines modern mass education – though in different measures – develops worldwide. Observations of this kind have inspired some comparative scholars to talk about a 'world system', whose ideals the local national educational systems, more or less consciously, try to fulfil.

Whether justifiable or not to talk about a 'world system' *per se* there is no doubt that the ideas of the Enlightenment are still as active and influential as at the time in which they were fostered.

THE CHURCH AND THE STATE IN ARGENTINA AND BRAZIL: KNOWLEDGE, RELIGION AND PEDAGOGY

Maria C. M. de Figueiredo-Cowen and Silvina Gvirtz

Introduction

In Latin America, the Catholic tradition is the basis of identity, originality and unity of the subcontinent. It is a historical and cultural reality, with only one exception in the twentieth century: the leftist revolutions in Cuba and in Nicaragua.

Historically and traditionally, the relations between the Church and the State have been very close, particularly during colonial times. The expansion of the Portuguese and Spanish empires, in the fifteenth and sixteenth centuries occurred in the name of the Crown and of the Church. In Brazil, for example, one of the first actions when the Portuguese first landed on the coast, of what is today Porto Seguro in Bahia, was the celebration of a Catholic mass.

With independence, later in the nineteenth century, tensions started to emerge in the new republics which came to favour a secular State, particularly under the influence of Comte's positivism among, especially, the military elites. Nevertheless, the Church continued to have a voice in public policies.

Education was one area of intense debates. Groups representing secularism and groups representing the Catholic Church, in their search to maintain political hegemony, had specific educational programmes which contained a vision of society and a pedagogical project.

This chapter will discuss the relationship between the Church and the State in different cultural, economic, political, and social periods in both Argentina and Brazil. The analysis will try to contextualise the efforts that different governments, the political and intellectual elites and the Catholic leaders undertook to define school curriculum, the knowledge to be offered to pupils and the many pedagogical practices to their individual political and educational projects. The chapter finishes with an identification of the Argentine and Brazilian similarities and differences in terms of the relations and patterns of their political ideologies, their different economic problems and their different educational practices.

State and Catholic Religion in Argentine Primary Schools: A Historical Approach (1884–2007)

The purpose of this section is to introduce a review of the historical development of the relation between the National State and the Catholic Church, as regards basic education in Argentina. Before 1880 education was basically provided by the families and the Church. The participation of the State in providing education increased dramatically in the last decades of the nineteenth century. At that time the conflict between the Catholic Church and the sectors who were running the National State increased dramatically.

So this part of the article comprises the period from the enactment of the national *Ley de Educación Común* (Common Education Law) no. 1420/84 (1884) up to the present. Special emphasis will be paid to the disputes by and between both actors about whether primary school should be Catholic or secular.

This analysis is structured on the basis of three relevant periods. The first one, where secularity prevailed in primary school, lasted from 1884 until 1930, after which Catholicism was re-established – starting with the conservative restoration of the 1930s and continuing during Perón's administration (1946–1955) – when the teaching of the Catholic religion in public schools became mandatory. The third and last period is from the end of the 1950s up to the present. Two aspects will be highlighted from this last period.

The Origins of the Argentine Primary School and the Regulation of Secular School Legislation: Public Law 1420 Passed in 1884

Different experts (Puiggrós, 1989; Tedesco, 1970) refer to the 1880s as a key decade for the construction of the Argentine National State and the simultaneous institutionalisation and massification of the basic educational system. During this period in Argentina, the different actors involved in the design of the national education agreed on the central role that the State should play in such affairs. However, they disagreed on whether the State should offer a secular or Catholic education. That is to say, if *public education* should be inspired in Christian doctrine and if the Catholic religion should be studied at schools.

As Braslavsky (1989) suggests, the convergence of opinions on the central position of the State as regards education, arose, among other factors, out of the institutional and organisational weakness of the Church.

Tedesco (1970) points out how religious freedom began to win the main battles as after Rosas' fall. Such freedom belonged to a project carried out by an entire generation of exiled liberals during Rosas' administration and was imposed in the discussion of the Constitutional Convention, which in 1853 and 1860 passed a Constitution rejecting Catholic standpoints and therefore the possibility of adopting the Catholic doctrine as the State's religion. However, the political strategies of the National State as regards the Church aimed at controlling it and thus avoided an institutional separation between the Church and the State.

During 1884, different actors, both liberals and Catholics, were faced in the national parliament under a process that finalised with the enactment of the *Ley de Educación Común* (Common Education Law) 1420.

Nevertheless, Tedesco (1970) points out that those liberals tried to justify secularity at schools on the basis of the strong immigration process undergone by the country during that time. To that effect, they focused on the immigrants from northern Europe, which resulted in the need of a school space characterised by its religious freedom.

The above mentioned Law 1420 set in place the gradual, free and secular nature of primary school in the City of Buenos Aires and National Territories. During the following years, the *Consejo Nacional de Educación* (National Education Council) constructed the necessary regulating measures to make effective “religious tolerance and neutrality”, which, pursuant to such law, should be obeyed at schools.

Therefore, the incorporation of secularity into primary school was a real defeat for the Catholic Church. The triumph of secularity in education crossed even the borders with national jurisdiction to provinces where the teaching of the Catholic doctrine was compulsory in official schools and, after 1884, was adjusted to the secular model embraced by Law 1420 (Campobassi, 1964).

Nevertheless, as time went by, the Church became stronger and thus its possibilities of offering education grew. At the same time, new social sectors began to consider Catholicism as a potential means to unify the nation. Therefore, the Church started to modify its viewpoint on educational matters and found the climax of its development during the conservative period that started in 1930 and continued during the Peronist period until 1954 and the last military dictatorship (1976–1983) (Braslavsky, 1989).

Catholic Education Is Back

Campobassi (1964) indicates that the first 45 years of enforcement of Law 1420 showed no major difficulties in applying the legal principle of school secularity and the teaching of the Catholic doctrine. Both conservatives (1884–1916) and radicals (1916–1930) respected and obeyed the legislation on “secular school”. Even the majority of the main educators of that time, such as Berra, Torres, Ferreira, Scalabrini, Vergara, Mercante, Senet, Ingenieros, Korn, González, Nelson and Vera Peñalosa supported the idea of the ‘secular school’ (Campobassi, 1964).

In 1930 (with a military coup) the conservative forces returned to the national and provincial political powers. During almost the three following decades there was, in the teaching in the primary school, an intense anti-liberal and anti-positivist preaching and action, developed under the consecutive protection of conservatism and Peronism. These were years of a strong offensive carried out by the Catholics in order to control public education. In these respects, Puiggrós (1993) points out how, as from 1930, the spiritual, nationalist-authoritarian movement began to advance in the political arena. At the same time, values and rituals of Catholicism started to gain space and influence, rather than the secular motif on discourses about school.

During the first years of the conservative administration, the resistance of different actors impeded the Church's offensive to defeat school secularity from resulting in national laws. However, this was not the case in the provinces. Some jurisdictions that had failed to adopt the Catholic doctrine as the official religion, during such years passed laws or decrees by which the teaching of Catholicism was implemented in primary schools. Among such jurisdictions, the cases of Buenos Aires and Santa Fé stand out (Campobassi, 1964).

The clerical offensive became stronger as from 1943, when the Armed Forces dominated and focused on the public arena (Campobassi, 1964). Puiggrós and Bernetti (1993) considered that the government arising out the strike of 1943 represented an ideology that did not allow for the continuity of secular education. On December 31, 1943, Decree 18.411 was passed. The teaching of the Catholic religion became mandatory in Argentina's primary schools. Catholicism was to be taught as "ordinary subject" within the curriculum. A period of the decisive rise of the school Catholicism thus culminated. Its beginning dated back to 1930 and its first victory took place in 1937, a year in which Catholic teaching became imposed in Buenos Aires province, under the administration of Manuel Fresco (Puiggrós, 1993).

The "Catholic revenge" within the framework of elementary teaching did not preach tolerance towards secular values. In these respects, Campobassi (1964) highlights the infinite number of slanders against everything that was non-Catholic, presented in the text books used for religion teaching. Civil matrimony, "false religions", liberalism and school secularity were clearly among the references of this advanced Catholicism.

The victory of Peronism in the general elections of 1946 ratified the path that had been adopted as regards Catholicism and primary school teaching. Law 12.978 passed on April 29, 1947 implemented the teaching of Catholicism in public schools. Two years later, the amended National Constitution declared that both the family and the private institutions were the pillars of the school system. As noted by Puiggrós and Bernetti (1993), the Constitution, far from establishing the State's hegemonic role as regards education, indicated participation in supporting private or community activities. This constituted since the origins of the national educational system the strongest step towards the encouragement of the development of private teaching.

Nevertheless, by the end of the Peronist era, a crisis arose in the relations between the Catholic Church and the State, and the more relevant consequence was precisely the annulment of the Law that years ago had consolidated the teaching of the Catholic religion in public schools. Therefore, Law 1420/84 was enforced. Provincial legislatures followed the national Congress and also annulled the corresponding laws of jurisdictional enforcement. As Campobassi (1964) points out, the whole power that the Catholic Church had gained in elementary education disappeared within only 6 months of confrontation with the Peronist administration.

Together with the so-called *Revolución libertadora* (Liberating Revolution) that toppled Perón on September 16, 1955, the Catholic sectors began to argue for the re-enactment of the decree of the year 1943. However, the new government maintained Law 1420 in force and thus a policy of secularity for the elementary school.

Religious Education from the 1960s to the Present

As from 1958, together with the election of Frondizi as President of the nation, new perspectives arose about Catholic education, unexpectedly fostering private education. This was the beginning, for the first time in national education history, of the construction of private education as an organic system. As indicated by Narodovsky (2001), the sustained and progressive change of the State's regulations towards private schools – that granted them more autonomy and the same legal status as that of public schools – constitute one of the most relevant characteristics of the State's education policy from the 1960s until today.

Finally, during the last dictatorship, between 1976 and 1983, there were five consecutive ministers of education in the national framework. Nevertheless, two administrations stand out: those of Bruera and Llerena Amadeo, characterised by their explicit interest in restoring order, hierarchies and authority, and for consolidating social sciences (Tedesco, 1983).

Special interest shall be paid to Llerena Amadeo's project, and his commitment to traditional Catholic ideology. He followed the most traditional line of the pedagogic authoritarianism. One of his fundamental goals was the limitation of the secularisation process. Therefore, during these years, the values of the Catholic doctrine were incorporated as components of moral education into the curriculum of the national elementary education. All through the country, there were different expressions of this incorporation. In some cases, the Catholic religion overlapped with the contents of moral education and, in others, it was directly taught as a school subject (Tedesco, 1983).

Catholic Education Today

According to the poorly developed school census of 1883, at that time there were a total of 437 private primary schools, 109 (25%) were religious. Today, almost 120 years later, one out of four Argentine non-university students attend private institutions (Morduchowicz, 2001); more than half of them (57%) get their education in Catholic schools. Even when the primary stage (EGB) is relatively the less developed within private education (it gathers 21% of students, against the 79% of the public sector), its participation in Catholic institutions in comparison to the total in the private sector is higher (63%) than that of the middle education (55%).

The encouragement of private education that the National State started, either in an explicit or implicit manner, by 1960, has modified the public tradition of the elementary school in Argentina. Braslavsky (1989) points out that, in this process, the Catholic Church succeeded in becoming the most powerful private education entrepreneur, currently the majority of the institutions offering private education in Argentina.

Perhaps, in conclusion, it is plausible to assume that, even when the Catholic Church as from 1960 began to develop a strong presence in Argentine education, based on its main role in the private education sub-sector, it has never ignored public schools, taking advantage of each opportunity offered by the different historical circumstances to

incorporate its religious values and ideology into the national curriculum. The Catholic Church is now one of the main actors in the educational arena.

The Church and the State in Brazil

Religious education in Brazil since colonial times was based on the official religion of the Portuguese Empire, later adopted by the Brazilian Empire – the Roman Catholic religion. With the Proclamation of the Republic in 1889, the legal separation between the Church and the State took place, as stated in the Constitution of 1891. The State became laic. No particular religion was named as an official religion, but, in practice, the teaching of religion continued to be the teaching of Catholicism (Cury, 2004). The most recent educational legislation – the Constitution of 1988 (Art 210) and the Law of Directives and Bases of 1997 (Art 33) declared religious education to be an integral part of the basic education of the citizen. It also established religious education as a discipline, with optional attendance in the school curriculum in primary and lower secondary State schools. Details such as the definition of the model of religious teaching, the curriculum organisation, the methodology and the kinds of teachers who should teach were given special attention.

Indeed the relationship between the Catholic Church, the State and education in Brazil has always been very close. It has taken different characteristics historically: the actors and roles have altered from the Jesuits and the overall control over education (in the colonial times) to ecclesiastics and Catholic intellectuals (in the early twentieth century) opposing the so-called educational reformers in debates on school curriculum, and higher education.

This second section of the chapter proposes, therefore, to analyse these tensions between the Catholic Church and the State in Brazil, particularly in significant *momenta* of the trajectory of the Brazilian educational system. It will try to point out the struggles the Church went through in trying to maintain a continuous and stable presence in the educational scenario, sustaining (or fighting to sustain) a hegemonic role in the formulation of educational policies. The counter-reactions from intellectuals and politicians advocating a free and laic educational system will also be sketched. Each group had a specific educational project with a model for the school curriculum, the kinds of knowledge that should be offered and the pedagogical methods to be used.

The Jesuits, the Colony and the Empire

With the arrival of the Portuguese in Brazil, in the sixteenth century, the Jesuits were granted a privileged and hegemonic position in setting up and controlling the cultural and educational scenario of the new colony. They set up schools for catechisation of the native Indians and to provide basic education for the children of the administrators.

The Jesuits believed they had a supernatural right to be in charge of education. This right was taken away from them when they were expelled from Brazil by the

Marquis of Pombal, an influential politician and Prime Minister for King Joseph I, in the eighteenth century.

Thus, for about two centuries, the Jesuits controlled the school curriculum and the knowledge offered in schools in the Portuguese empire, metropolis and colonies. Overall, the educational principles of the Jesuits included: the search for perfection; total obedience to the superiors; and a very strong discipline. Education was at the core of their work: it served the purposes of catechism (for the native Indians), for evangelism (as an efficient instrument of counter-reform) and for the training of the elites in the colonies (Schwartzman, 1979; Maciel & Neto, 2006).

The Jesuit pedagogical experience was based on the *Ratio Studiorum*, according to which theology was at the top of the pyramid, followed by philosophy. The choice of books and texts was under strong control. New questions or opinions formulated by pupils were not permitted (Schwartzman, 1979; Alves, 2007).

The concept of pedagogy and the knowledge that should be offered in schools, according to the Jesuits' educational project, were subordinated to the Church and the religion. As Alves states:

The main objective of the Jesuits was to spread the gospel, and all the activities carried out by the priests in Brazil were subordinated to the Church and religion. The labour of the Jesuits required them to involve themselves in domestic political and educational matters, as well as meet the needs and interests of the Catholic Church. (Alves, 2007, p. 15)

Two Jesuits did a remarkable job in the provision of education in the newly conquered colony: Father José de Anchieta and Father Manuel da Nóbrega. They established a large number of missions in different regions of the colony, they created large schools and they were very inventive: with the constant lack of pedagogical material, they used songs composed by themselves, they distributed books and texts they wrote themselves, they set up dramas to teach Christian morals and religion (Alves, 2007).

The curriculum, the knowledge content and the methodology of the educational project implemented by the Jesuits in the colony, therefore, were mainly associated with the training of priests, the men of letters and the scholars. The teaching of Latin, grammar, rhetoric, humanities, and religious doctrine was the basis of the curriculum. The main concern was with moral education and saving souls.

The Jesuit control expanded so much that the Jesuits were asked for advice by the King and the politicians on matters of the State. Any important position in government or inside the Church was decided only after consultation with the Jesuits. The overall dominance of the Jesuits was also perceived by some politicians as blocking Portugal from modernisation, as if a barrier all around Portugal isolated it from the modern culture. Such a power started to upset a very influential politician, the Marquis of Pombal. When he became Prime Minister, he banned the Jesuits from Portugal and all Portuguese territories (Schwartzman, 1979, p. 14).

The Marquis of Pombal was Prime Minister from 1750 to 1777, under King Joseph I. Very controversial and charismatic, the Marquis of Pombal represented Enlightened Despotism in Portugal in the seventeenth century. Two places, London and Vienna,

where the Marquis de Pombal served as diplomat, had a remarkable influence on his pedagogical project of renovating Portuguese and colonial education. In London, he became convinced that the English economic success resulted from applying scientific knowledge to the productive sector (Falcon, 1982). In Vienna, as Serrão puts it:

[I]t was in this capital that the spirit of the Portuguese Minister, in contact with the world of politics and diplomacy, drank the great principles of the Enlightened Despotism which he would apply to his country on his return. From there he also brought, as understood by Maria Alcina Ribeiro Correia, the economic and cultural ideas which were the key elements of his government. (Serrão, 1982, p. 22)

While he was Prime Minister, Pombal promoted a series of reforms in the country, at the administrative, economic, educational and social levels. According to Maciel and Neto (2006), with the Marquis de Pombal, the Jesuit traditional methodology was replaced by a pedagogical proposal that advocated State and lay schools. The position of director of studies, with an advisory and quality-control role, was implemented; isolated classes (*aulas régias*) replaced the course in humanities, created by the Jesuits. Such innovative pedagogical proposals and new forms of curriculum aimed at offering the necessary conditions for the modernisation of Portuguese society.

The Pombal reforms – primarily secular – were indeed extensive. They expanded the school curriculum, with the creation of schools of mathematics and philosophy. Knowledge was fundamentally based on sciences and applied knowledge. Secondary education was changed radically, with special attention given to Latin, Greek and French. Vocational education was introduced with classes in trade and artillery. The dual system of education was implemented: popular education, with emphasis on spelling, grammar, arithmetic, Christian doctrine, and social and civic education, and education for the nobility through the ‘College of the Nobles’ (Avellar, 1983, p. 12; Teixeira Soares, 1961, p. 218; Schwartzman, 1979, p. 18).

Inspired by Luiz Antonio Verney, a philosopher of the Enlightenment, Pombal’s pedagogical project included the secularisation of teaching, the importance of Latin, Greek, Hebrew, English, French, Physics, Anatomy, and free and laic schooling. Azevedo summarises well Pombal’s pedagogical proposal:

Instead of a single system of education, the duality of schools; instead of an education entirely classic, the development of scientific teaching ...; instead of the exclusive teaching of Latin and Portuguese, the progressive penetration of modern languages and literatures (French and English); and, finally, a variety of trends ... open up the ways to the first conflicts between the old ideas, embedded in the Jesuit teaching, and the new pedagogical thinking, influenced by the French encyclopaedists. (Azevedo, 1976, pp. 56–57)

In the colonies, the educational reforms under Pombal aimed at restoring the State control over education, secularising education, and standardising the curriculum. Schools were set up in different villages, one for boys and another for girls. The curriculum and

knowledge content was also differentiated according to gender: boys would learn how to read, write and count, and the Christian doctrine. Girls would learn how to look after the house and how to sew (Salem, 1982; Maxwell, 1996).

One direct consequence of Pombal's pedagogical reforms was the progressive loss of prestige and power of the Catholic Church at the educational and political arenas. However, the Church never gave up hopes of regaining the same privileged position – of playing a major role in education in Brazil. The loss of power resulted initially from Pombal's policies, then from the impact of the French Enlightenment in the eighteenth century, and, particularly, under the French Positivism wave that influenced the political, cultural and educational stances of Brazil.

The Republic, the New State, and the Military Regime

During the Empire, in the nineteenth century, right after Independence, following the Constitution of 1824, the Catholic religion was declared the official religion of Brazil. But the Church had a very submissive position to the government (Iglesias, 1971). The situation became much worse with the Proclamation of the Republic, in 1889. Brazilian generals, politicians, and intellectuals, under the leadership of Benjamin Constant, favoured the ideas of Comte and of the French Positivism in politics and in education.

Indeed, in Brazil, as well as in Argentina, Chile, Cuba, Mexico, Uruguay, among other Latin American countries, in the late nineteenth and early twentieth centuries, educational policies were framed by the principles of Positivism. Sobreira points out:

[T]he Positivism answered the issues raised by the Republicans i.e. the split between the Church and the State, the idea of a republican dictatorship, the appeal to a strong and interventionist power, the progress through the State, the rejection of the monarchy and the incorporation of the proletariat to the new society. (Sobreira, 2003)

Positivism influenced profoundly the Republican leaders. As Carlos Roberto Jamil Cury states:

From an officially Catholic country through the Imperial Constitution, we became laic with the Magna Carta of 1891, which proclaimed freedom of religious and freedom of expression, but prohibited the State from establishing any religious worship, from having any financial responsibility, and from creating any form of alliance. (Cury, 2004, p. 188)

At the time of the proclamation of the Republic, industrialisation was emerging; the urbanisation process was gaining strength; immigration from Europe was increasing; and a strong urban middle class started to grow, similarly to emerging industrial and working classes. Therefore the new social and economic classes hoped to have a more effective participation in the rapidly changing society. In counterpart, in politics, the

new political regime was becoming weaker. The elites, from the coffee-based oligarchies, were facing opposition from the new social classes. Different political, social, mainly urban, movements emerged, with proposals for the reformulation of society, education included. An example of such social, political and cultural commotion is the Week of the Modern Art in 1922 and the founding of the Communist Party (Iglesias, 1971).

The Catholic elites (ecclesiastics and intellectuals) started to reorganise themselves in order to offer alternative proposals for the reformulation of society and education. The journal *A Ordem* (*The Order*), launched in 1921, and the creation of the Centre D. Vital, in 1922, played a very important role in what Salem calls the “Catholic renaissance” (Salem, 1982, p. 4).

The Catholic movement was not an isolated action. The weak political frame of the First Republic stimulated the emergence of different movements which were advocating their own proposals for reforming society, as it happened with the Catholic movement. With the Revolution of 1930, the Church did regain some legitimate power. Thus, education became an important element of bargain. Educational reforms were seen as paramount for the reformulation of society (Salem, 1982; Cury, 1978).

Soon, two pedagogical proposals dominated the national debate on education for almost a decade, during the 1930s. The Catholic group interpreted education from an ideological perspective – education would serve as a basic instrument for structural transformations in society. What became important was a version of education framed by the teachings of the Christian doctrine (Cury, 1978; Nagle, 1974; Salem, 1982). The Catholic proposals involved the dissemination of a higher Catholic culture and the insertion of Catholic legislation in the Constitution.

Intellectuals such as Jackson de Figueiredo, Alceu de Amoroso Lima, Father Leonel Franca, Sobral Pinto, and the Archbishop of Olinda and Recife, D. Leme, played a major and extremely important role in the Catholic movement of the first half of the twentieth century. They all shared the same vision of transforming society through education (Cury, 1978; Salem, 1982).

The Catholic movement gained a new impetus during the 1930s, with a series of organisations such as the Association of the Catholic University Students, the Catholic Institute of Higher Studies, the National Confederation of Catholic Workers, the Confederation of the Catholic Press, the Association of Catholic Bookshops, the *Mariana* Congregation, the Workers Circles, the Association of Catholic Teachers. Such organisations had an impact on different sectors of national life. Very important also was the Brazilian Catholic Action, created in 1935.

During the 1930s, education became a major issue nationally. As Schwartzman states:

[I]t was only with the so-called “Revolution of 1930”, which brought Getúlio Vargas to power and began a new period of political centralization, that education finally appeared as a national priority. (Schwartzman, 2004, p. 17)

It is precisely in the period between 1930 and 1945 that the Catholic movements enjoyed its major prestige. Of course this was helped by the political situation before and just after the 1930 Revolution. The State formed a heterogeneous coalition of rather weak political parties. This gave to the Church more bargaining power including

the redefinition of its influence vis-à-vis the relationship with the State. This is well illustrated by Salem:

D Leme ... in the inauguration of the statue of Christ the Redeemer in 1931, which gathered several groups of Catholics ... warns: "The name of God is crystallized in the soul of the Brazilian people. Either the State acknowledges the God of the people, or the people will not acknowledge the State." The warning ... was immediately understood by Vargas. From that time, a new phase in the relationship between the temporal and ecclesiastic power begun to consolidate; from a situation of separation and lack of harmony between the two institutions it moves to a situation of cooperation and progressive closeness. (Salem, 1982, p. 10)

Four main themes were consistently important issues for the Church. The first was the fight against communist infiltration in Brazil; the second, the non-legalisation of divorce; the third, the official recognition of the Church, by the State, to be inserted in the Constitution; and, the fourth, the introduction of religious teaching in schools.

The battle against Communism was going to be a long process but the output for all the other policy-areas were almost straightforward gains. In the Constitution of 1934, for example, the religious wedding was made official; religious education was reintroduced in the school curriculum. Education was a kind of important negotiating tool used by politicians and by Catholic intellectuals in order to bring together the Church and the Vargas government. The Ministry of Education, in the early 1930s, Francisco Campos, for example, wrote to Vargas arguing the necessity of re-establishing an alliance with the Church through education (Lima, 1931; Cury, 1978).

Opposing the Catholics in the debate about education was the group known as the Pioneers of Education, followers of the New School Movement. This movement, which had its origin in a similar movement which emerged in the USA and in Europe at the end of the nineteenth century, was based on John Dewey's ideas. It represented a reaction against the traditional pedagogical practices and aimed at an education which would promote the integration of individuals in society and a wider access to schools. This group consisted mainly of the so-called progressive educationists and important scholars such as Lourenço Filho, Afrânio Peixoto, Hermes Lima, Carneiro Leão, Anísio Teixeira, Fernando de Azevedo who conceptualised education on a different basis. They published in 1932 the *Manifesto of the Pioneers of the New Education*, written by Fernando de Azevedo, based to a large extent in the ideas of Anísio Teixeira and signed by a large number of the Pioneers (Azevedo, 1932). The *Manifesto* soon became the clear divider between the progressive group and the Catholic group. For the Pioneers, education and the expansion of schools was an important mechanism that could guarantee the insertion of the country in the developed world.

Educational reforms should take place following a specific pedagogical epistemology, which was based on John Dewey's philosophy, mostly on the concept of education as the only means for the implementation of a truly democratic society where individuals would be respected. Teixeira, after reading Dewey and after becoming acquainted with the American pragmatism, was greatly influenced by ideas on democracy and science; he believed that education was the only instrument able to generate changes in the modernisation needs of the country. The Pioneers of Education of the New School,

similarly to the Catholic groups, gained institutional support through the creation of the Brazilian Association of Education, in charge of organising lectures, courses and conferences (Cury, 1978; Salem, 1982; Piletti, 1996).

The main ideas of the *Manifesto* included the following themes: education is a means of reconstructing democracy in Brazil; it ought to be essentially public, compulsory, free of charge and lay; any discrimination based on differences of race, sex or kinds of study should be excluded; education must also be carried out inside communities; education ought to be unified and suited to attend all stages of human development; unity does not mean uniformity; education must be adapted to take account of regional characteristics; the pupil ought to be the focus of education; and the curriculum must be adapted to the pupils and their interests; every teacher, even those who teach in primary education, ought to be educated at a university (Piletti, 1996, pp. 177–178). These themes translated the pedagogical project of the Pioneers of Education, which clashes with the Catholics pedagogical project particularly in two areas – the confessional and the private aspects of education.

Some of the scholars of the New School, at the time, held important positions in different states of Brazil. They transformed their pedagogical principles into public policies through educational reforms in different states and in the Federal District. The political moment in Brazil was very favourable to reforms and new educational policies. The country was undergoing important political, economic and social changes – urbanisation was under rapid progress, the expansion of coffee plantations brought along industrial and economic progress, and liberalism emerged as a strong political and philosophical ideology (Schwartzman, 2004; Piletti, 1996). Anísio Teixeira, for example, was State Secretary of Education of the Federal District, Rio de Janeiro, from 1931 to 1935. He was able to plan and implement educational reforms locally, within the principles that oriented the New School Movement. Teixeira created a municipal system of education, from primary school to higher education. He introduced modern school architecture, expanded the number of places in schools, introduced the system of secondary technical schools and transformed the Normal School into an Institute of Education. Teixeira also assured the dissemination of his educational ideas and projects by his writing. Publications such as *Educação Progressiva – uma introdução à filosofia da educação* (Progressive Education – an introduction to the philosophy of education) and *Em marcha para a Democracia* (Towards Democracy) were published in 1932 and 1934, respectively, during his term of office at the Secretariat of Education in Rio (Cury, 1978; Schwartzman, 2004).

The principles the Pioneers believed in and fought for included the restructuring of educational systems which would lead to national reconstruction. This meant that those in control of educational systems were those who would hold power. More important than power in Teixeira's concept of education in a changing society is the notion that the school should be prepared to train the new man, a modern man integrated to a democratic society. Hence, Teixeira's beliefs in science, in the scientific method and its technical applications (Teixeira, 1968).

The Catholics too believed that new pedagogical projects were of a political nature. Thus education would be an important instrument of power. Like Teixeira and other Pioneers of Education, Alceu de Amoroso Lima and Father Franca offered their

arguments as advocated by the Church in a number of books and articles (Franca, 1931; Lima, 1931). One argument put forward by Alceu de Amoroso Lima was about spiritual revolution as the only basis for the re-implementation of order in society:

[T]he spiritual unity of the nation is no longer, for the liberalism, a concern of a public nature. All sorts of unity are considered: political unity, legal unity ... The only unity that the political liberalism of today has no interest in is the spiritual unity which is, however, the basis of all others. (Alceu, 1931, pp. V–VI)

At the core of the criticisms of the New School Movement by the Catholics was the concept of the laicisation of education, a key idea in the project put forward by the Pioneers of Education. For the Catholics, the pedagogy advocated by the New School educators had to be opposed as it had no consistent pedagogical principles. In such a project, sciences dominated philosophy and ignored the supernatural aspect of the human being. Such pedagogical projects presented a purely utilitarian and pragmatic character. Education, for the Catholics, had to be religious; the lay school, because it rejected education, was unable to educate (Franca, 1931; Lima, 1931).

Another issue in these debates referred to who should be in charge of education. The pedagogical proposal of the Pioneers of Education argued for the pedagogical monopoly of the State. The Catholics' proposal referred to the Church and the family as the main institutions in charge of education. The State would have just a coordinating role in the provision of education (Cury, 1978; Salem, 1982).

Finally, the legislation of 30 April of 1931 established the optional character of religious education in State schools. It satisfied the claims of the Catholics. However, the conflicts between the two groups did not cease. Rather than consensus, with the *fait accompli* – the 1931 legislation – the two groups continued the debates.

Thus, after 1931, under the pressure of the Catholic movements, religious education was included in the school curriculum as a discipline, but of an optional attendance. In subsequent Constitutions, including the last one in 1988, religious education remained legally part of the school curriculum in both State and private schools. But the matter continues to be highly complex and controversial within the context of a laic State, a secular culture and the multiplicity of creeds (Cury, 1993).

The late 1930s were marked by a sequence of activities. The Association of Catholic Teachers and the Brazilian Catholic Confederation of Education started to promote conferences and courses nationally. The aim was to formulate an educational policy based on the Christian doctrine. There were gains from both sides – the Catholics and the Pioneers. The Constitution of 1934 recognised semi-officially the Catholic Church by inserting articles stating the recognition by Civil Law of the religious wedding, the dismissal of divorce, and the incorporation of facultative religious education in state schools. As a counterpart, in the same Constitution of 1934, it was stated that it was the privilege of the State to intervene in matters related to the National Plan of Education. It also stated that primary school would be free and compulsory for all. Therefore, both groups had their basic claims approved by the State. However, Lima speaks of the lack of a precise pedagogical project from both groups:

If the merit of the Catholics was to emphasise the national dimension, that of the reformers was to open an opportunity that the non-dominant social groups did not benefit from. ... The birth of the school of the people was far away. Education continued to be an agent of the dominant classes. (Cury, 1978, IX–X)

In the pedagogical proposal of the Catholics, the knowledge that should be offered in the schools is the Catholic vision of the world and of men:

Such a pedagogical ideal is provided not by the experimental sciences but by a concept of life dictated by the speculative sciences. These, in turn, are governed by ethics which are subordinated to theology. (Cury, 1978, p. 54)

In contrast, the Pioneers of the New School argued for a pedagogical proposal whose knowledge content is based on sciences:

Hence such (educational) sciences are to be based on the social sciences and those which intend scientifically to discover the normal processes that act upon the human being. They are, for example, Physiology, Biology and Psychology. Biology requires the harmony of education with the tendencies of children. The social sciences locate the role and social function of the school. This forms the *scientific basis* of the school organisation. (Cury, 1978, p. 83)

Thus the tensions between the Catholics and the liberals lasted almost 20 years. These tensions were also evident in relation to higher education. The first movements from the Church to the creation of Catholic institutions of higher education in Brazil emerged in the first decade of the twentieth century. The aim, similar to the creation of the Centre D. Vital, was the co-optation and the religious teaching of the elites. A few institutions, such as the Association of Catholic University Students and the Catholic Institute of Higher Studies, were implemented to offer support to the Church in relation to their proposals for a Catholic higher education (Salem, 1982).

The first attempts to offer formal courses at higher education level were provided by the Catholic Institute of Higher Studies. Initially the curriculum was limited to three compulsory disciplines (Sociology, Philosophy and Theology) and three facultative ones (Introduction to Law, to Mathematics and to Biology). Later the curriculum expanded considerably. As pointed out by Salem, in the late 1930s, the number of students rose to 200 (Salem, 1982, p. 18).

Of course, the task of providing Catholic studies at higher education level was not an easy one. According to Decree 19.851, of 11 April 1931 which implements the Statutes of the Brazilian Universities, the State was given a strong role in terms of administering and controlling higher education, thus keeping the Church away. So for the Catholic leaders and scholars it became clear that they would not have the support of the State to implement their Catholic model of university. The Catholic Institute for Higher Studies, created in 1932, set out the first grounds of the future Catholic University. As Salem points out:

[T]he Catholic University is considered by the Catholic and Church leaders of the time as having a dual political meaning ... it would be an institution which would oppose the laic education and mentality, it would guarantee the solution of national crises; and it would block the penetration of the communist ideology in the country ... the Church supposedly would reach its aims of re-evangelisation of society and of the State itself. (Salem, 1982, p. 21)

The Catholic Institute for Higher Studies was meant to provide an alternative model of university in Brazil. The belief among the Catholic scholars and ecclesiastics was that this would liberate the university from State rule, as it should always belong to the Church. Naturally, the Catholics were upset with the creation of the first state university in 1934. They considered the University of the Federal District, implemented with the support of Anísio Teixeira, as laic and anti-Catholic. There were even claims that the new institution would make easier the Americanisation of Brazilian education or even favour the transformation into a Communist institution (Salem, 1982).

The need and urgency to have a Catholic University was claimed in the First Council of Brazilian Bishops in 1939. Two years later the first Catholic Faculties were implemented, after having received the official approval of the National Council of Education. The courses included Law, Philosophy, Literature and Languages, Geography, History, Social Sciences and Pedagogy. They were geared mainly to the training of secondary school teachers, within the Catholic pedagogical framing. All the Faculties included in the curriculum a course of religious culture (Salem, 1982). In 1942, by governmental legislation, the Catholic Faculties were granted power to award their own certificates, similarly to the federal and state universities. In 1946, through Decree 8.681, the Catholic Faculties were upgraded to university level, the Catholic University.

Today, the knowledge and curriculum provided by the Catholic Universities go beyond religious education. Almost all areas of knowledge are offered, from humanities to sciences in almost every state in Brazil. They are private, as are 2,000 institutions. Still today, the Federal and State universities in Brazil fight vigorously against any government financial support of any kind for the private universities. Most of the Catholic universities are institutions of excellence.

In the second half of the twentieth century, there were dramatic changes in the Brazilian economic and political life. The military elite, associated with the economic elite, took power, in 1964; democratic elections were banned; educational reforms at primary, secondary and higher levels took place in the 1960s and 1970s, following the economic and political ideology of the military regime (Figueiredo, 1986, 1987). The Church had a different role in the political and cultural life, during the military regime. Initially allied to the military government, in 1964, it opposed the regime when issues about torture started to emerge.

The Episcopal Latin American Conference in Medellín (Colombia), in 1968, was a turning point in the position of the Church. Inspired by the principles of the Second Vatican Council (1962–1965), the actions of the Church moved towards the material conditions of the population. In Brazil, certainly the Church was vital in the process of re-democratisation of the country through the Basic Ecclesiastic

Communities (Comunidades Eclesiais de Base) and the Theology of Liberation (Castro, 1984; Pucci, 1984).

Religious Education Today

The teaching of religion in state schools cannot be treated as a simple question of curriculum. The dialectic between secularisation and laicism embedded in sociocultural contexts has to be considered.

In fact, the Constitution of 1824 established Catholicism as the religion of the Empire (Pauly, 2004). The Republican Constitution of 1891, under the influence of the Positivism, abolished religious education from the school curriculum, declared education as secular, and the Church was separated from the State (Pauly, 2004). In all subsequent Constitutions, as mentioned previously, religious education became a constitutional matter. Through Decree 19.941 of 1931, Vargas

reintroduces the teaching of religion in state schools, authorize the Church authorities to design the programmes, to choose the textbooks, appoint teachers and supervise their fidelity to the doctrine and moral. (Cury, 1978, p. 175)

Since 1931, overall, the teaching of religion, although optional, was rather of a catechist nature and remained outside the list of regular disciplines of the school system. The teachers were not allowed to be in the state payroll. There was no consensus on the content of teaching. The majority of teachers of religious education in schools normally belonged to a specific religious order. In other cases the teachers were members of the community, involved in catechism or other religious activities. Such *status quo* remained until the 1990s.

New definitions about the kind of knowledge religious education should offer, and its place in the school curriculum, started to emerge when Law 9.394 of Directive and Basis of National Education, of 1996, Article 33, confirmed religious teaching as a duty of the State, as an optional discipline: “Religious education, of an optional enrolment, is a discipline within the normal timetables of primary and lower secondary education in state schools, and will be offered, without costs for the State” (Cury, 2004). The counter-reaction of the Catholics was immediate and effective. In 1997, Law 9.475 amended Article 33 maintaining the compulsory provision of religious education in the curriculum and its optional nature. It also opened up the possibilities for using public money for teachers’ salaries (Cury, 2004). At the same time, the new text of Article 33 introduced some innovations: religious education would integrate the education of the citizen; each educational system would regulate the process of the definition of the syllabus as well as the training and recruitment of teachers (Cury, 2004, p. 186). Heavily involved in the discussions about and advice on the kinds of knowledge to be offered in religious education is the Permanent National Forum of Religious Education (Forum Nacional Permanente do Ensino Religioso – FONAPER), created in 1995. The FONAPER has been very active in the promotion of courses, in writing documents and publications, in the definition of the knowledge that ought to be

in the curriculum, as well as in the training of teachers. The Curriculum Parameters for Religious Education, as set out by FONAPER, include the emphasis on the importance of a pluralist and diversified society, on the religious traditions in different sociocultural contexts, and on the moral attitude of human beings.

The implementation of the curriculum parameters have, though, varied in the different states of the country. The discussions are still very much on. The association of politics has some bearings with the past. Recently, schools managers and teachers have been suggesting that a pedagogical school project is a political project as it is based on a certain vision of the world and a certain ideology.

Finally, the discussions about secular education and lay education go beyond a “curricular component in schools”, according to Cury (2004, p. 183). The lack of continuities in educational reforms planning and implementation is far more complex. The difficulty may reside in the historical social-context in which such reforms take place.

Conclusion

Argentina and Brazil have kept, perhaps, a balance between what they have in common and their differences. Linguistically and culturally, the differences are quite striking. Portuguese and Spanish are Romance languages, sometimes leading to embarrassing confusions. The Argentine tango and the Brazilian samba are much embedded in each culture and do not transfer (in any serious way) between the countries. Politically, both societies have, since Independence, oscillated between strong, authoritarian (very often military), and democratic governments. Even a huge national shame – torture – has tarnished some periods in the history of both countries. Economically, both Argentina and Brazil have gone from real stages of economic stagnation to a flourishing economy – though not always at the same time.

In education, the similarities are evident since colonial times. As in Brazil, the Jesuits dominated the whole Argentine educational system. They built schools throughout the colony, and they were in charge, teaching and evangelising. Only a very few schools were under the control of municipalities.

With independence, throughout the nineteenth century, the political system was rather different in Argentina and in Brazil. So was the educational system. In Brazil, there was an Empire. Up to the Proclamation of the Republic, the Catholic Church was the official Church and religious education was compulsory. In contrast, in Argentina, for only 3 years, from 1943 to 1946, was religious education – compulsorily – part of the school curriculum.

In both countries, the tensions between the Church and the State loosened occasionally but never disappeared. A strong alliance had been formed with conservative governments. Whenever democracy is restored, as has happened in the late twentieth century, especially since Tancredo Neves’ election in Brazil and since Raúl Alfonsín in Argentina, the Catholic Church has maintained its influence in the formulation and implementation of educational policies. In Brazil, for example, the 1997 legislation resulted from pressures from the Catholics to change Article 33 of Law 9396 of 1996 – religious education, of an optional nature, remains integral part of the school

curriculum. In Argentina, it was again the Church which blocked the Kirchner government from introducing a new curriculum content based on the evolution theory.

Equally powerful in both countries is the presence of a high quality level system of private Catholic schools. A number of them have been able to get subsidies from the government in order to offer places to the working class. This is an invisible, very powerful action of the Church in Argentina and Brazil, as well as elsewhere in Latin America. It should not be underestimated.

CONFUCIANISM, MODERNITIES AND KNOWLEDGE: CHINA, SOUTH KOREA AND JAPAN

Terri Kim

This chapter offers a critique of the Confucian legacies in East Asian modernities, knowledge and pedagogies. Specific examples are drawn from China, Korea and Japan for comparative analysis. The three countries in East Asia have all experienced the historical repetitions of discarding and then reviving the Confucian legacy at different times of modernisation. However, they all have kept the strong Confucian *pedagogic* culture, which frames the ways in which knowledge is transmitted and applied to define modernities in East Asia.

Confucianism has a huge continuity – although it has been travelling widely and rewritten over time. There have been various East Asian historiographies, writing and rewriting the Confucian legacy in East Asian modernisation since the late nineteenth century. Scholars attributed the lack of development in East Asia to that tradition initially, before more recently attributing the success of these countries to the same tradition (Bellah, 1957, 1968; Eisenstadt, 1968; Morishima, 1982; Weede, 1996; Bell & Hahm, 2003).

In other words, Confucianism has been used to account for both the failure and success of modernisations in East Asia over time. Confucianism used to be condemned as a major cause for the economic stagnation of East Asian countries in the nineteenth and early twentieth centuries, and then started to be praised as a major constituent in the belated but rapid economic take-off and sustained industrialisation process in Japan first, whose path was followed by South Korea, Taiwan, Singapore, Hong Kong, and now China (Berger, 1986, 1988; Tu, 1984, 1996; Tai, 1996).

Overall, Confucianism has been a frame of reference to explain East Asia as if the legacy of Confucianism is the key to understand the commonality of the East Asian enigma of late development and fast modernisation. The Confucian paternalistic modalities of family and social relations (Bell & Hahm, 2003), and the public significance of educational credentials in training and selecting the governing elite, Mandarin cadre (Zeng, 1999; Wilkinson, 1964, 1969) have been acknowledged as a chronic attribute to both the retardation and remarkable success in economic development in East Asia (Woo-Cumings, 1999).

Although interpretations of Confucianism have been written at different times in both positive and negative ways, it is argued that what has *not* changed is the acknowledgement of Confucian “pedagogic” attributes to East Asian education and societies. The pedagogic

attributes of Confucianism such as filial piety and patriarchal authority can be identified broadly in the characteristics of Confucian political and social relations sustained in the extended family-like “network institutionalism” (Ansell, 2006), which generates interdependence, mutual obligation and reciprocity, and strictly hierarchical social relations according to age, gender and status. However, these characteristics may be identified also as the common attributes of non-Western, and/or ‘traditional’ societies.

What is regarded as uniquely Confucian is the East Asian ‘secularism’ and ‘meritocracy’ epitomised in the tradition of exam-oriented schooling and the exam-based selection of the civil servants in East Asia. The state’s control over school curriculum and other facets of schooling and selection processes in East Asian countries in order to guarantee the merit-based equality of educational opportunity, in principle, can be regarded as a particular attribute of the Confucian pedagogic tradition.

Whether this proposition is true or not in practice, and how the Confucian pedagogic elements are sustained or distorted in the contemporary real-life contexts in China, South Korea and Japan will be examined. Accordingly, the chapter is organised in the following thematic order: (i) Confucian concept of modernity; (ii) the nature of knowledge and education in Confucianism; (iii) East Asian modernisation and the attributes of Confucianism; (iv) East Asian pedagogic commonality as the attribute of Confucianism; (v) Confucian impact on educational mobility in the twenty-first-century global knowledge economy and migration. The conclusion of the chapter will discuss a way forward by discussing Confucian pedagogy as dogma in the postcolonial discourse of Orientalism. A very basic question is raised first: what is ‘Confucian’?

Confucian Modernity and Knowledge

It was in the era of Han Dynasty (206 BC – AD 220) that the Chinese State and the ruling class of literati developed a strong commitment to the ancient virtues labelled ‘Confucian’. There is a corpus of literature dating from antiquity, the *Analects*, the *Mencius*, the *Great Learning*, and the *Mean*, in which Confucius (551 BC – 479 BC) is revered as a sage; and the literature, however obscure its origin, forms a body of tradition called Confucianism (Zeng, 1999, p. 20).

There is a Confucian belief that knowledge is the beginning of cosmic order in the following sequence: learning the Confucian ideas and canon, developing thoughts, maturing souls, self-cultivation, self-realisation, family regulation, the state in proper order, and the world in peace. In this order, Confucius perceived the State as a product of natural evolution and therefore it is only a part of society. Neither Confucius nor his disciples give any formal definition of the State. The existing Western literature shows that Confucian political thought does not have the idea of the State in Western terms: that is, the Confucian State does not originate in a “state of nature”, nor does it take its legitimacy from a “social contract” (*Book of Change*, Chapter ii, re-quoted from Hsü, 1932, pp. 33–36). From the formation of earth to the development of ethical State, there are eight steps of evolution symbolised by: Heaven and earth; material things; male and female; husband and wife; father and son; sovereign and subject; high and low; and propriety and righteousness. They signify, in order, the physical state,

the dawn of life, the dawn of man, the dawn of social life, the age of patriarchy, the political stage, the constitutional stage, and the moral stage. The ‘Great Appendix’ of the *Book of Change*, emphasises these principles of relation and of sequence, according to which the State should be organised (Hsü, 1932, pp. 61–89).

Confucianism is a system of politico-ethical ideas in which rules and principles for the guidance of private life are bound up with those for the regulation of the public careers of men entrusted with the responsibility of governing. Therefore, there is a close link between ethics and politics in the Confucian State. As the state orthodoxy, Confucianism laid down the principle of social order – that is, an ethic of filial piety and loyalty for social hierarchy as the key to social stability (Zeng, 1999; Tu, 1996).

Confucianism also connected moral virtue to knowledge. It then exhorted a meritocratic order by rewarding virtue and merit-based Confucian scholarship with official governing position. During the Han Dynasty (206 BC – AD 220), provincial schools were established and the Confucian tradition of education was spread across China. Since then, this corpus of literature was studied by the literate people throughout imperial Chinese history in the East Asian region. The Four Books were chosen as the curriculum for the civil service examinations *keju*. *Keju* was a government-orchestrated system of high-stakes employment testing, which started to run in AD 606 and officially ended in 1905, with a total span of almost 1,300 years. At its height of implementation, millions of examinees were tested in China in each 3-year cycle (Suen & Yu, 2006, pp. 48). At the national level civil service examinations, candidates were tested on the ability to analyse contemporary political problems, in addition to the usual examinations based on the Classics. There were also highly prestigious special examinations held occasionally by imperial decree. The less prestigious examinations were testing candidates in law, calligraphy, state ritual and military skills (Dawson, 1981, pp. 71–73). For the imperial civil service examinations, candidates had to memorise a vast amount of classic Confucian texts, but never needed to demonstrate the ability to either theorise or challenge a particular premise. The *raison d’être* of the scholar-Mandarin class after all was the reproduction of bureaucratic generalists familiar with an accepted ethical outlook and body of knowledge, but not engaging in epistemic disputation, nor academic specialisation. According to the exam results in the *keju* system, successful candidates were appointed to the government posts immediately or eventually. However, the success rates of these exams were extremely small. During the Tang Dynasty (618–907), which was a period of political stability and cultural progress on the basis of the Confucian civil service system, the passing rate of *keju* was only about 2% (Merson, 1990, p. 86). Overall, *keju* was a “high-stakes” assessment, as termed by Suen (2006). The personal endeavour and ordeal that individuals underwent both in the preparation and in the taking of these exams has become part of Chinese lore.

The strong Confucian culture of learning to succeed in civil service examinations was emulated in neighbouring countries, especially in Korea. During the Tang Dynasty, Korean Confucian scholars and students travelled to China to study and prepare for the Confucian civil service examinations. For instance, Choe Chiwon (857—tenth century), a distinguished Korean Confucian scholar Mandarin, philosopher and poet of the late Unified *Shilla* period (668–935), went to Tang China at the age of 12 to study Confucianism. When seeing off the 12-year-old son, his father told if he did not pass

the Chinese imperial civil service examination within 10 years, he would cease to be his son (*Samguk Sagi*, biography no. 6; quoted from Chang, 1977, p. 57). And within the decade Choe indeed passed the highest civil service exam to be appointed to high office in the Chinese government. He remained in China for another decade to serve as a high-ranking scholar-Mandarin in the Chinese government, close to Emperor Xizong of Tang China, before returning to Korea (ibid).

In East Asian societies, education has been a forceful instrument of the ruling elite to govern the state. According to Confucius, it was through education that the ruler should “learn to care for the people”, while the ruled “learn to be obedient” (Zhou, 1996, p. 242). The Confucian ideal was to put learning and meritocratic selection at the heart of governing elite culture. Throughout imperial Chinese history, emperors were regarded as grand patrons of education, paying formal visits to the national university, issuing edicts for the establishment of schools, and paying honour to Confucius as the ‘first teacher’. Chinese Emperors were lectured on Confucianism by venerable neo-Confucian scholars (Dawson, 1981, p. 20).

The democratic and meritocratic nature of Confucian education principle, that is, it offered a path of upward mobility to anyone who could survive the rigours of study and examinations, was established by Confucius himself. A traditional saying attributed to him states that “those who work with their heads will rule, while those who work with their hands will serve”. To that end, test-driven education became a strategy for survival and success in East Asian countries. The Chinese meritocratic principle of the civil service examination to recruit governing elites was also emulated by France and Britain in the nineteenth century when these countries were expanding their overseas colonies and thus needed public servants for their far-flung imperial outposts (Wilkinson, 1964, 1969).

The Chinese neighbouring countries of Korea and Japan in East Asia – and also Vietnam in Southeast Asia by extension – all absorbed and refined Confucianism in the state apparatus, though they had developed their separate versions of Confucianism, which increasingly diverged along with a different path to modernisation taken by each country (Pye, 1985, pp. 55–89; Smith, 1996, pp. 155–159). For instance, Confucianism in Korea transformed its originally matrilineal societal order into a patrilineal one (Deuchler, 1992) to establish a more hierarchical order, and at the same time to institutionalise the principle of meritocratic promotion through the civil service examination system – *gwageo* in Korean – which was fully adopted in AD 958 and lasted until the late nineteenth century. During the period of *Chosun Yi* Dynasty (1392–1910), which was the last and longest-lived dynasty in Korea and East Asia on the whole, Korea was a thoroughly Confucian State. The Confucian civil servant examination in Korea was formally abolished during the *Gabo* Reforms of 1894, along with legal class discrimination and the old rank system (Eckert *et al.*, 1990, p. 98; Jin, 2005, pp. 226–234).

However, the Confucian principle of examination-based selection of civil servants has survived strong regardless of modernisation and changes in political and education systems. The meritocratic principle of Confucian civil service examination is still applied: that is, anyone who passes the civil service examination is to be appointed as a public servant, and being a civil servant still means having power and security in Korea. Therefore, entrance into the civil service is highly competitive, and therefore, most of those who pass the civil service examinations are often from the most prestigious

universities in Korea (Kim, 1997). The Confucian scholar-Mandarin tradition has also survived in contemporary Korea, forming a close collaborative relationship between the government officials and the university academic profession. It is not so uncommon to see university professors being appointed as ministers or other high-ranking positions in the government in Korea, or occupying seats in the National Congress (Kim, 2001, pp. 227–228).

Japan also adopted an examination system, testing the Chinese Confucian classics in the Heian period (794–1185), but unlike in China and Korea where those who succeeded in the examination were almost always given a high-ranking civil service position, the main route to the highest positions in Japan was hereditary privilege based on the *on'i* system (Amano, 1990, pp. 21–23; Zeng, 1999, pp. 8–9). Japanese Confucianism started as a cultural ideology serving the political needs of the Tokugawa *shogunate* (1600–1868), forging alliances with Buddhism and Shintoism. As time went on, Japanese Confucianism increasingly diverged from its origin as a political ideology and became a collection of social and ethical codes (Hwang, 1979, p. 18; re-quoted from Smith, 1996, p. 158).

Overall, the great significance of Confucianism in the history of East Asian modernity is that Confucius himself was a model and inspiration for countless scholars who often had to undertake half a lifetime of study before they at last succeeded in passing the civil service examinations. If they were unsuccessful in these ambitions, for them, too, teaching was the only obvious alternative outlet for their talents. And many of them would keep the ambition to become a scholar-Mandarin in the future, especially at the time of a cabinet reshuffle. They would hope to take the call to assume high-ranking government positions then.

The Nature of Knowledge and Education in Confucianism

The Confucians believed that there was a body of absolute truths, which combined moral principles with cosmological laws, and that this body of knowledge had been already understood and written down by the Confucian sages (Dardees, 1983). This scholastic belief in a body of absolute truths directed energy towards mastering classical writings and standard interpretations (Wilkinson, 1964, p. 162). Therefore, Confucian scholarship was dominated by documentary studies that sought to observe and preserve the traditional conventions of the histories and the classics. Study of the Confucian cannon was the most valued knowledge in the Confucian State, while astrology and calendar making played a supporting role. Medicine ranked far down the list and the status of mathematics was even lower. Technology and applied science did not find favour in the Confucian World (Wilkinson, 1964, pp. 53–54).

In the Confucian tradition, knowledge *per se* is not important; it must be practised, though not pragmatically. Confucius himself dealt with neither theology nor metaphysics, but with moral and political conduct. For Confucius, and for the Chinese tradition in general, learning did not usually mean the accumulation of knowledge for its own sake. It meant the gathering of knowledge for the sake of guiding one's social conduct (Dawson, 1981, pp. 9–10). Given the emphasis on 'practising' knowledge, some

Confucian examination compositions demanded the application of general set rules to a particular situation or problem – as illustrated earlier, and through Zhu Xi's emphasis on self-discipline for the governance of men (*hsui-chi cihh-jen*), neo-Confucian knowledge was accepted as an ideal for social order in China and throughout East Asia, wherever the neo-Confucian curriculum became established.

Neo-Confucianism is based on the moral values of universal knowledge application such as self-cultivation, self-realisation, individual responsibility, family cooperation and local self-governance (Tu, 1996). Self-cultivation here means to determine one's proper position in the *network of social relationships* and to behave properly according to one's position. The principle of self-cultivation is applied to everyone, regardless of social status hierarchy. The ruler is obliged to set an example for all men of self-restraint, self-correction and self-improvement. In that sense, the central concern of Confucian knowledge is how to learn to be human. Learning to be human in Confucianism is not simply learning the skills of a particular profession or becoming proficient in one specific task. The learning process is continuous and holistic in Confucianism.

There are five types of knowledge Confucius saw as being crucial in the process of learning to become human. Each of these five areas is articulated in one of the Five Classics: The *Book of Poetry*, the *Book of Rites*, the *Spring and Autumn Annals*, the *Book of History*, and the *Book of Change*. During the later Han dynasty, the incorporation of the *Analects* and the *Book of Filial Piety* into the "Five Classics" made up the "Seven Classics". The basic neo-Confucian texts, the Four Books, the *Great Learning*, the *Doctrine of the Mean*, the *Analects*, and the *Mencius* are centrally concerned with self-cultivation of the person as the prospective bearer of leadership responsibilities (Hsü, 1932).

The neo-Confucian doctrine was established on the premise that the nature of man is fundamentally good, but it is also a metaphysical system of thought that endeavours to find the roots of this premise in the natural order of the cosmos – with a philosophical account of sagehood, self-cultivation, and, ultimately, the universe. Through deductive reasoning, neo-Confucians divided all existence into two inseparable components, *li* and *qi*. *Li* is a patterning or formative element that accounts for what things are and how they behave, or normatively should behave, while *qi* is the concretising and energising element. The two are interdependent and inseparable. In this dualism, two distinct neo-Confucian Schools developed further in Korea since the late fifteenth century: one giving primary emphasis to *li*, the other arguing the primacy of the role of *qi*. These different intellectual visions also competed for political endorsement in Korea (De Bary, 1981; Eckert *et al.*, 1990).

In China and Korea, the Confucian State organised the education system to transmit this knowledge based on (neo-) Confucian orthodoxy, and subsequently to recruit into government service those who had best mastered the (neo-) Confucian classics. The core values exhorted in the (neo-) Confucian classics – humanity, empathy, harmony and the reciprocity of public and private relations and responsibility, civility, and communality – seem to offer a timeless relevance and universal validity as the ideas of modernity.

However, can we actually ascertain that Confucianism has survived as a dominant moral pedagogic creed in contemporary China, Korea and Japan? How do we legitimatise the relevance of Confucianism in the contemporary East Asian contexts of modernity and knowledge?

East Asian Modernisation and the Attributes of Confucianism

Apart from the origins and deep traditions of Confucianism in China, Korea and Japan before they followed the Western paths of development, it has been controversial to discuss the relevance of Confucianism as an epistemic frame of East Asian modernisation and industrialisation. In *The Protestant Ethic and the Spirit of Capitalism* (1930) and *The Religion of China: Confucianism and Taoism* (1951), Max Weber argued that the reason why modern capitalism did not develop independently in Asia is primarily because of the restraining influence of religion: in China, Confucianism and Taoism.

Soon after the Second World War, however, many scholars, journalists, politicians and other pundits started to reverse Weber's thesis on Confucianism. While accepting Weber's (1930) thesis of a cultural basis for economic activity, they reject any notion that Western Protestantism is the only, or the best, religious foundation for capitalism. The successful nation building and economic development of post-war Japan, and then the East Asian newly industrialised countries (NICs) was then attributed to their common heritage of Confucianism – as something equivalent to Protestant ethics contributing to industrialisation in Western Europe. Central to the Confucian values are hard work, education, merit and frugality, and these values are also essential to the development of modern capitalism, as Weber viewed the Protestant ethic as the engine of Western capitalism.

During the second half of the twentieth century, the success of strong government-led economic development in East Asia has offered a new model for modernisation with the concepts of 'Confucian Capitalism' (Yoshihara, 1977, 1994; Kahn, 1979; Vogel, 1979) and the 'Developmental State' (Johnson, 1999; Thompson, 1996). The Confucian characteristics identified by scholars are strong government, tight bureaucratic structure, hierarchical order of social relations and networked social structure, a high level of educational aspiration and attainment, emphasis on diligence, thrift, cooperation, and loyalty to one's group/organisation, etc. Accordingly, Yoshihara Kunio, a well-known Japanese Development economist, argued that the best way to hasten economic development is through the strong government or a developmental state which 'educates' the people and initiates a dynamic private sector (Yoshihara, 1977, 1994, pp. 196–197, 202; Berger, 1997, p. 269). Also, in *Ideology and National Competitiveness: An Analysis of Nine Countries*, edited by Lodge and Vogel, for example, the concept of a neo-Confucian 'Developmental State' is offered to account for the rise of East Asia (Lodge & Vogel, 1987).

Overall, Confucianism has been interpreted as a frame of reference to understand the pattern of East Asian political and economic activities in the process of rapid industrialisation. It has been suggested that the Confucian traditions of patriarchal authority, filial piety and loyalty in the extended family-like social relations, thrift, hard work, and most of all, the respect for scholarship and learning and the bureaucratic privilege, were all embedded in the East Asian political and economic development (Tai, 1989; Tu, 1996; Berger, 1997).

In Korea, social relations and activities involve concern for *inhwa*, or harmony based on respect of hierarchical relationships, including submission to authority. For

Japan, public relations operate within the context of *wa*, which stresses group harmony and social cohesion (Alston, 1989). In both Japan and Korea, employees were often indoctrinated to regard their workplace as a family environment with the company director as a family head. They were taught to identify themselves as members of a big family, typically organised in the order of a Confucian family hierarchy, which is especially visible in big business companies, conglomerates (i.e., *Zaibatsu* in Japan and *Chaebol* in Korea). Given the group orientation demarcating the social boundaries of inclusion and exclusion, academic bonding (*hack-yeon* in Korean) has been regarded as crucial for successful employment and career development in Korea, in particular. In the academic profession, academic power networks have been most evident in the proportion of alumni faculty members at major universities; for instance, in 2002, the proportion was 95.5% at Seoul National University, 80% at Yonsei University, 68% at Korea University, and 60% was the national average. In comparison, at Harvard and Stanford, the proportion of alumni (who gained a bachelor's degree from the university) among the faculty members was only 12% and 1% respectively (KBS 1TV Report, 10 June 2006).

In China, social relations and organisational behaviour revolve around *Guanxi*, or personal connections. The Chinese place great emphasis on rank, but *Guanxi* operates on the individual level. *Guanxi* links two persons, often of unequal ranks, in such a way that the weaker partner can call for special favours for which he does not have to equally reciprocate (Alston, 1989). In the Chinese social relations determined by *Guanxi*, personal rank or organisational position may not be indicative of his or her power; a person of low rank, in government or elsewhere, may in fact be very influential because of *Guanxi* relationships with those in higher positions. This individualistic aspect of *Guanxi*, apart from the primary stress on family ties, seems to allow Chinese workers to change employment easily. Given the cultural terms of the Chinese social relations, the Chinese-based economies in both mainland China and overseas experience a large rate of both job mobility and entrepreneurship (Alston, 1989; Buttery & Wong, 1999).

Despite these intra-East Asian variations, it can be suggested that the overall terms of social relations have been derived from Confucianism, which in this context emphasises the regulation of 'unequals' for a harmonious social order. Such interpretations of the social regulation of Confucianism as attribute to East Asian modernisation and industrial development are often compared with Weber's thesis on Protestantism in the rise of Western capitalism – as indicated earlier.

In this line of discourse, metaphors like dragons, tigers and even cubs have been adopted to describe the rapid and successful economic developments of East Asian countries. However, it can be argued that these metaphors are the actual sign of persistent Orientalism applied to the contemporary East Asia. Lee (2006) also contends that it is a little too far-fetched to emphasise Confucianism as the main cultural attribute to the capitalist economic success in the East Asian region extensively. For instance, economic advancement of Hong Kong and Singapore may have been attributed more to the legacy of British capitalism, and therefore should be differentiated from the Korean and Japanese pattern of economic development, which was based on a close relationship between political and business circles. Similarly, Kwon (2007) argues that Confucian virtues

can be better seen as the products of the State's inculcation and social engineering for modernisation and economic development rather than culturally inherited and embodied social values.

Staying on this line of argument, it is suggested that what makes Confucianism significant in the trajectory of East Asian modernisation in general is not so precisely related to economic development per se as the pattern of education and pedagogic relations.

East Asian Pedagogic Commonality as the Attribute of Confucianism

Some major characteristics of the Confucian pedagogic tradition are embedded in the East Asian State systems and sociocultural habitus – as incorporated in the concepts of 'Confucian Capitalism' and 'the Developmental State' as discussed earlier, in which the relations of high level of educational attainment of the populace and economic development have been acknowledged. By the 1970s, all children in South Korea and Taiwan (as well as the rest of East Asia) were in primary schools, and a third or more were in secondary schools. In contrast India had only 50% of girls in primary schools, while in Bangladesh it was 34% and Pakistan 22% (Pempel, 1999, p. 170). It has been suggested that the Confucian ethics and values in learning and hard work are both directly and indirectly contributing to the rapid and successful national development in East Asia.

Confucian values stress the importance of education and the ethics of hard work, and harmonious but hierarchical social relations, and the Confucian literature equates education with 'moral training'. In the *Book of History* and in the *Mencius*, it is reported that the legendary sage-emperor Shun appointed a Minister of Education to give instruction to the people because they were not observing the five basic relationships – that is, the duties involved in the relationships between father and son, ruler and subject, husband and wife, elder brother and younger brother and friend and friend (Dawson, 1981, p. 11). The Confucian stereotype of the gentleman also epitomises the Confucian advocacy of learning and the virtue of frugality, which was much admired by Confucius: a poor scholar strives for examination success despite his humble origins. Overall, it can be argued that Confucian pedagogic legacy of 'filial piety' and 'meritocracy' continued to serve in the East Asian schooling systems in the course of rapid industrial development.

A notable commonality in the East Asian schooling systems is that school education is serving the purpose of examination-based selection. (The educational selection system for university entrance has been most controversial in education reforms in Korea, for example. It has changed more than ten times since 1945.) Arguably, however, the strong zeal for learning in East Asian societies often does not derive from intellectual curiosity or thirst for knowledge per se, but from the single-minded pursuit of a successful university entrance and a successful job. Lack of curiosity in learning is closely related to lack of creativity in education.

Overall, the strong culture of learning across East Asian societies is often a highly focused and purposeful activity to prepare for various kinds of examinations and

eventually to gain certificates. The pragmatic value and use of formal education has been highly appreciated by the common people themselves, who are eager to take and use education as an important conduit for upward social mobility. It has been reported that 72.6% of all Korean students take additional private tuitions after school to prepare for and excel at the competitive university entrance examinations (Choi, 2003; KEDI, 2003). Given the culturally deep-rooted stress on higher learning and significant rewards afterwards when successful in examinations, the enrolment rate in higher education in East Asian countries is very high in general. The case of Korea, for instance, shows that 97% of 18-year-olds graduated from high schools, with 81.3% of these advancing to higher education institutions in 2005. Similarly, in Japan, 97.5% of 15-year-olds proceeded to senior secondary education, and 76.2% of 18-year-olds went on to higher/post-secondary education institutions in 2005 (Yonezawa & Kim, 2008). Other East Asian countries such as Taiwan and Hong Kong, which are often identified as 'mini dragons' as inheriting the Chinese Confucian traditions, have also shown high levels of educational attainment. China is moving towards mass higher education since 1999, given the rapidly increasing gross enrolment rate in higher education from 9.8% in 1998 to 22% in 2006 (MoE, PRC; *China News*, 10 March 2007: www.china.org.cn).

Whilst serving individual pragmatic needs for education, the modern schooling systems in East Asia have been carefully designed to meet the State's political and economic projects such as mass socialisation into the prevailing values of the predominant regime, unifying society, producing skilled labour for rapid industrial development, and regime continuity (Pempel, 1999, pp. 137–181). The government's regulations over educational institutions for the state's purposeful, utilitarian, technically functional uses of (higher) education are the common characteristics in China, Korea and Japan, denoting the mixed historical legacies of the Confucian, Japanese imperial/colonial State, and Mao's cultural revolution and Chinese communist education. All in all, it can be argued that the trajectories of East Asian modernisation and political and economic developments have been closely linked to the Confucian legacy of valuing education in general. The Confucian political ideal was 'to rule the state by moral virtues', which had to be developed by 'education'.

In the Confucian tradition of education, stress is always on living well, living properly, *here* and *now*, and by one's own actions. According to Confucius, society is made up of five basic relationships: Confucius laid great emphasis on harmony and his teaching was largely concerned with the problems of good government: "Only after the self is cultivated, can the family be regulated; only after the family is regulated, can the state be governed; and only after the state is governed, can peace be brought to the land" (Confucius, 2006, p. 8). Thus, the most distinct value of Chinese society is harmonious relationships, not only within oneself, but with other people, or even nature and the whole world. The Confucian concept of learning can then be considered as humanistic, universal lifelong education which starts with self-cultivation and continues in day-to-day social actions as praxis. Such a group-oriented attitude has been believed conducive to both economic productivity and social cohesion in East Asian countries.

In the Confucian culture-framed East Asian societies, learning together in a 'social setting' is highly treasured (Yang, 1981). This may be related to the group orientation (like a web-like extended family relations) in Confucian pedagogic traditions, which is in contrast to the individual-centred learning in Western/European pedagogic tradition. At the micro level of observation on East Asian instructional practices, we can also find the continuity and commonality in the pedagogic style in East Asia. For instance, in China, Korea and Japan, classroom teaching is conducted typically in a whole-class setting where the role model of the teacher is essential. The expectation of the teacher in Confucian East Asia is still that he be a scholar gentleman with good subject knowledge. Expertise in pedagogy is secondary. This results in a direct teaching to the whole-class mode in East Asian countries. Such an expectation of a 'scholar-teacher' and a modality of whole-class teaching can also be found in the old European university lecture tradition; but not so much in the contemporary Anglo-American pedagogic model. Overall, in the Confucian framed East Asian education tradition, a teacher should be primarily a scholar before he is able to play the role of a facilitator of learning.

Can we say then that there is a Confucian pedagogic element embedded in the commonalities of East Asian instructional practices? And what are the values implicit behind these common instructional practices? The curricula in the East Asian schooling systems are content-oriented and test-driven, in general (Zeng, 1999), and accordingly, East Asian education has often been criticised as learning by rote. However, the scholars in the Effective Schools movement have revalued the East Asian mode of 'learning by repetition', arguing that repetition in the East Asian pedagogic context is a conduit to deeper understanding and thus it should be differentiated from the much criticised concept of 'rote' learning in the West (Biggs, 1994, 1996; Marton *et al.*, 1996).

However, an obvious problem with the East Asian whole-class teaching and learning by rote and exam-centric systems is that only a certain type of individual is chosen: that is, those with a good memory, who are extremely hardworking, pliant, and good at tests, even though there is no strict proven correlation between possessing these qualities and being a good administrator or bureaucrat as idealised in the Confucian tradition.

Overall, it can be said that the main goal of East Asian schooling has been to produce literate, disciplined workers for factories and offices; and the secondary goal is that by pushing students through a tapering hierarchy of universities, the graduates of top-tier universities are likely to be successful in the meritocratic competitions to enter the best jobs in government ministries and major corporations. In East Asian schools, the pecking order comes straight from grade scores. In fact, this type of elitism, over time, has engendered insularity, cronyism, arrogance, and an ideological and intellectual conformity and rigidity in Korea, which eventually can corrupt the Confucian principles of egalitarian educational opportunity and meritocratic selection. The current pattern of educational mobility and migration from East Asia, notably from Korea and China nowadays, to other countries, e.g., to the United States, in particular, and other English-speaking countries, points to the fact that there is strong public demand for alternative 'internationalised' education at all levels in East Asian countries.

The Confucian Impact on Educational Mobility in the Twenty-First-Century Global Knowledge Economy and Migration

An ancient Chinese story about Mencius' mother, who moved home three times to provide her son with good teachers, good neighbours, and good peers for a good education, is still very much relevant to contemporary East Asian mothers – the image of the 'education mother' is well known.

Educational migration has become a new trend in East Asia. There has been steep increase in the number of Korean students going abroad more recently. According to OECD, Korea has the second largest absolute number of students (after China) studying abroad. The number of primary and secondary school students in Seoul who have gone abroad to study was 7,001 between March 2005 and February 2006, marking an increase of 15% (Seoul Metropolitan Office of Education; reported in *Dong-A Ilbo*, 11 May 2006). The number of Korean students studying in the United States alone is estimated at 93,728 in April 2007. According to the US Immigration and Customs Enforcement (ICE) report, this is the largest absolute number – 14.9% of the total number of foreign nationals studying in the United States, 630,998 – followed by India (76,708), China (60,850), Japan (45,820), and Taiwan (33,651) (US ICE; re-quoted/ reported by *Kyunghyang Shinmoon*, 5 April 2007).

The number of Korean students going abroad, especially to the United States for studying purpose (at all levels from primary to higher education) has continued to increase, more than 10% per annum (*Kyunghyang Shinmoon*, 5 April 2007). The contemporary trend of educational migration notably from East Asia (Korea, China and Japan and Taiwan) to the United States and other English-speaking, advanced countries is an interesting and significant phenomenon to re-posit as entwined with the deep residual Confucianism in the minds of East Asian people, creating a new geography of transnational academic mobilities and networks in the twenty-first century (Kim, 2008).

Conclusion

The importance of Confucianism as a major reference for understanding East Asia has pervaded the dominant Western discourses on the rise of East Asia. In the political economic field, Confucianism was first seen as inhibiting development by Western theoreticians, and then was seen as encouraging it.

In China, Confucian thought was essential to the Empire – and then Mao attacked it in the course of Chinese communist modernisation. During the Cultural Revolution, an anti-Confucius campaign was organised and many Confucianists and intellectuals were killed and some Confucian temples and statues were destroyed. However, now that China has become a major player in the global market economy, the Chinese communist government has begun to promote Confucianism as well in order to wield China's 'soft power' across the globe. More than 120 Confucius institutes have been set up around the world – all sponsored and promoted by the Chinese National Office for Teaching Chinese as a Foreign Language, attached to the Chinese Ministry of

Education. The official aim of Confucius institutes, since first opened in Seoul, South Korea, in 2004, is to promote Chinese culture and language (Hyland, 2007). These overseas Confucian institutes are seen as part of a diplomatic strategy for China to gain global influence through education and culture capital. Such ‘soft power’ is particularly influential in Asia-Pacific countries, where large ethnic Chinese communities, natural resources and close relations with the United States are the incentives to the Chinese government.

Overall, in East Asia, Confucian thought has been moving, and has been changed and institutionalised in different ways. In terms of education, however, Confucianism gives a number of simple *unchanging* pedagogic patterns – such as the status of teachers, exam-driven schooling, the culture of patriarchal authority and hierarchy, respect for seniority, conforming to group norms, and individual success in education tied to ‘family face’ (Watkins & Biggs, 1996).

However, even in the field of education, Confucianism has been subject to a double interpretation – for example, the typical East Asian emphasis on memorisation and rote learning has been appraised both critically and positively. A number of authors – for example, Watkins and Biggs (Eds.) (1996) – have tried to explain the phenomenon referred to as ‘the Asian learner paradox’. This is the apparent contradiction between the teaching methods/educational environment in East Asia (i.e., large classes, a teacher-directed whole-class teaching, examination-driven, content-oriented curriculum rather than process, emphasis on memorisation, etc.), and the fact that East Asian students have regularly performed better than their Western counterparts in international measurements – such as the IEA Trends in International Mathematics and Science Study (TIMSS) and the OECD’s Programme for International Student Assessment (PISA). In the PISA results reported in 2003, Korea, Japan and China were all highly ranked. Korea, for instance, was near the top of the league in mathematics, reading literacy and science, and at the top for problem-solving (www.pisa.oecd.org). Having noted the successful performance of East Asian students in international tests, however, it should be equally noted that Confucian thought has always stressed the moral, and this has affected the culture of schools (and not just the formal curriculum).

So there is something odd about Confucian thought – sets of double and changing interpretations in many places. Despite all these changing accounts and contradiction, Confucianism has always been used as a major explainer of ‘East Asia’. The over-generalisation of East Asian commonalities as ‘Confucian’, however, could easily trap us in the (self-) Orientalising discourse. This may distract us from the possibility of new alternative interpretations.

The academic practice of Orientalism¹ is found among contemporary East Asian scholars as well, whose analyses actually refer to the Western narratives of East Asia. As Meredith Woo-Cumings argued, “the East Asian response is reactive” (Woo-Cumings, 1993, pp. 142–143). For instance, Michio Morishima (1982), in his book *Why Has Japan ‘Succeeded’?: Western Technology and the Japanese Ethos*, explains Japan’s success as part of the wider Confucian heritage of East Asia. Morishima emphasised the importance of the role played in the creation of Japanese capitalism by ethical doctrines transformed under Japanese conditions, especially the Japanese Confucian tradition of complete loyalty to the firm and to the state.

Critics have used the term ‘new Orientalism’ to denote the notions of an essentialist approach to Confucianism. The contemporary “Asian Values” discourse, for instance, can be understood as a postcolonial Asian remake of Orientalism, which serves some political agendas in Singapore and Malaysia (Berger, 1997, pp. 265–275). Hung-chao Tai asserts that the “cultural setting” of Japan and the East Asian NICs creates what he describes as an ‘Oriental’ economic development model, which rests on “human emotional bonds, group orientation, and harmony”. He argues that the “Oriental model” is the first “meaningful alternative” to the Western model (Tai, 1989, pp. 6–7).

Overall, such a postcolonial discourse of ‘new Orientalism’ can be understood as a dialectical movement in East Asia. East Asian ‘Orientals’ have been incorporating Confucianism in their making and remaking of an East Asian version of modernity – given the Western reprises of revaluing Confucianism to classify East Asia over time. In that sense, Confucianism has been a dogma in the postcolonial discourse of Orientalism. The use of Confucian pedagogic attributes in the account of East Asian ‘modernities’ and modernisation will continue to change and evolve – obviously. The trouble is that we do not know yet how.

Notes

I I am indebted to Professor Robert Cowen for the initial suggestion that I should think about Orientalism and Confucianism as a frame of reference.

HINDUISM, MODERNITY AND KNOWLEDGE: INDIA

Joseph W. Elder

Introduction

Four thousand years ago on the Indian subcontinent priests (Brahmans) were teaching Hinduism's most ancient texts, the Vedas, to the sons of privileged families. These Vedas, preserved and memorized in a liturgical language, included a curriculum of sacrificial formulas, incantations, and magical spells that assumed a host of deities capable of responding to appropriately framed human petitions. Brahmans specialized in framing those petitions to the deities by performing fire sacrifices accompanied by correctly intoned Vedic recitations.

After 1947 India became a sovereign democratic republic committed, according to its constitution, to social, economic and political justice; liberty of thought, expression, belief, faith and worship; and equality of status and of opportunity. Article 45 of India's constitution declared that "the State shall endeavour (sic.) to provide, within a period of ten years ... for free and compulsory education for all children until they complete the age of fourteen years". The language used by India's national leaders while drafting their constitution was English – the language of a foreign power that had ruled sections of India since 1757.

During the intervening 4,000 years, what happened to the knowledge of those ancient Vedas, to the language in which they were composed, to the training in textual memorization by which that knowledge was transmitted, and to the Brahman priestly reciters, preservers, and expanders of the Vedic curriculum? This article will examine the Hindu knowledge traditions in ancient India, their differences from Buddhist and Jain knowledge traditions, their modifications in subsequent centuries, the knowledge traditions of the Jews, Christians, and Muslims who settled in India, the educational policies introduced by the British colonial rulers after 1757, the educational policies adopted by independent-India's government after 1947, and the emergence of militant Hindu groups with their own views of educational knowledge and how to introduce that knowledge into India's current school curricula.

Knowledge Traditions in Ancient India

For centuries before the Vedas were written down, they were transmitted orally from Brahman (priest) teachers to young men of the three higher ranks (referred to as *varnas*):

the priests, warrior-administrators, and wealth-producers. According to Brahman texts, women and those of the fourth (servant) *varna* were prohibited from learning either the Vedas or subsequent Hindu texts such as the Brahmanas, Aranyakas, and Sanskrit Upanishads, Sutras, and Shastras (Van Buitenen, 1970, pp. 4–7). By the end of the fourth century BCE the grammarian Panini had generated over 4,000 rules for a “purified” Sanskrit language. Subsequently, elite young men sitting in the presence of their teachers (gurus) memorized Sanskrit grammar rules, learned to chant accurately intoned Vedic passages, and debated points of complex schools of Hindu philosophy (Ghosh, 2002, p. 18). According to tradition, in time the Brahman Kautilya authored a Sanskrit text on statecraft, Caraka wrote a Sanskrit text on medicine, and Bharata composed a Sanskrit text on performing arts. Again according to tradition, the Brahman sage Manu produced one of many *dharma Shastras* (treatises on correct moral conduct) that mandated Brahman superiority, prohibited inter-*varna* marriages, and stigmatized categories of polluted people.

In northern India Mahavir (the founder of Jainism) and Buddha (both fifth century BCE) preached their doctrines of enlightenment denying the authority of Brahman priests and the usefulness of the Vedas. Their teachings and subsequent commentaries in liturgical or Buddhist Sanskrit and the spoken Pali and Prakrit languages were transmitted to the young not by individual gurus but by groups of monks in monasteries called *viharas*. Some of the *viharas* (both Mahayana and Theravada) evolved into monastic universities. A major Buddhist university in Nalanda (in present-day Bihar) founded in the fifth century CE flourished for six more centuries. According to a visiting Chinese monk, Nalanda University offered extensive training in Buddhist, Jain, and Vedic knowledge to as many as 10,000 students (including foreign scholars) at any given time (Basham, 1959, p. 165).

During the millennia before and after the start of the Common Era, major cities such as Kashi (Banaras), Prayag (Allahabad), Taxila, and Kancipuram became centers of classical Hindu learning. During this period new narrative texts were added to the Sanskrit Hindu corpus: the massive epics *Ramayana* and *Mahabharata* and shorter *Puranas* describing gods and goddesses unheard of in the Vedas. Although such Vedic gods as Agni, Indra, Mitra, Soma, and Varuna continued to be addressed in Brahman-administered rituals, popular devotions focused on such deities of the epics and *Puranas* as Vishnu, Lakshmi, Ram, Sita, Krishna, Radha, Shiva, Parvati, monkey-bodied Hanuman, elephant-headed Ganesh, and many others (Roy *et al.*, 2005, pp. 76–87). The narratives describing these deities’ adventures, passions, and foibles were typically recited in public settings open to all Hindus. Geographical sites in India became associated with specific deities and events: Brindavan where Krishna sported with the milkmaids; Rameshwaram from where Hanuman’s monkey army attacked Sri Lanka; Ayodhya, one of Lord Ram’s birthplaces; Janakpur, Sita’s hometown; and Banaras, Shiva’s shining city. Beginning around the fifth century CE Hindus built temples near these sites and often attached to them schools in which high-ranking neighborhood children, particularly Brahman boys, could study. When Hindu monastic orders began to appear, some of the ashrams or monasteries where their founders and propagators lived, such as Sringeri and Srirangam in southern India, became centers for the transmission of *their* Hindu philosophical systems.

Jews, Christians, and Muslims, when they arrived in India, established their own schools where their children could learn Hebrew, Persian, or Arabic and study the Bible or Qur'an, and related commentaries. The Jews along India's Malabar Coast built their own synagogues and trained their own rabbis. As Muslims built mosques throughout India, they frequently constructed *maktabs* or *madradas* (Qur'anic schools) with their mosques. There, local *maulvis* could teach neighborhood children about Islam and encourage them to be better-educated members of the Muslim *ummah* (community) (Ghosh, 2002, pp. 138–139). When Roman Catholic and Protestant missionaries came to India, one of their first acts often was to establish schools for Christian converts and potential converts in order to establish congregations that would continue to propagate the faith.

Throughout the centuries Brahmans wrote Sanskrit texts not only on *dharma* (correct moral conduct) but also on such topics as theories of esthetics and performance. However, India's musical, dance, and artistic knowledge traditions, although they might have made reference to those Sanskrit texts, were primarily transmitted from gurus to students, often in the gurus' homes. Artistic lineages evolved, known as *paramparas* (Ghosh, 2002, p. 140), that traced their training through a succession of gurus back to a presumed "original" guru. Some temples and royal courts provided financial support for performing artists and their *paramparas*, but the transmission of the performing arts themselves required years of disciplined learning by students from their gurus. In similar ways medical practitioners acquired knowledge from various texts (Sanskrit, Greek, Arabic, etc.) but primarily through apprenticeships with active medical practitioners. The skills of artisans, carvers, calligraphers, painters, and weavers were likewise typically transmitted through households, relatives, and kinship lineages.

British Colonial Educational Policies

In 1757, following the battle of Plassey, the British East India Company acquired administrative control of sections of Bengal, Bihar, and Orissa. For several decades the Company had no formal policy regarding education. Meanwhile, the Company acquired control of ever larger sections of the Indian subcontinent. Finally, in 1817 the Company founded Hindu College in Calcutta, followed in 1827 by Elphinstone College in Bombay. By now a debate had arisen among the Company's directors over whether the language of education in their territories should be Sanskrit, Arabic, Persian, local languages, or English. In 1835 the Company chose to follow the recommendations of Thomas Babington Macaulay's "Minute on Education." Macaulay's "Minute" declared there were no Indian books on any subject that deserved to be compared to British books. Macaulay argued that the purpose of education in Company-controlled territories should be to form a class of Indians who could interpret the Company to their fellow Indians – "a class of persons Indian in blood and colour [sic.] but English in taste, in opinions, in morals, and in intellect. (DeBary *et al.*, 1958, p. 601) In subsequent decades such educated Indians came to be called "brown Englishmen".

The Company's decision to use public funds for public education, mandate English as the all-India medium of instruction, and adopt the English curriculum for academic

content had far-reaching consequences. One consequence was that no efforts were made to incorporate Vedic, Jain, Buddhist or Muslim “other” knowledge into the schools’ curriculum. At that time the Vedic, Jain, Buddhist, and Muslim centers of “other” knowledge were too varied and too locally based to mount a coherent opposition to Macaulay’s “Minute”. The centers for such “other” knowledge were left to support themselves – or disappear. Another consequence was that many upper-caste young Hindus, recognizing career possibilities with the British, enrolled in the Company schools, exposing themselves to English “intellect”. Muslim young men were less eager to do so (DeBary *et al.*, 1958, pp. 739–740). Another consequence of the Company’s decision was that for the first time educated Indians throughout India, regardless of their birthplaces or mother tongues, could communicate with each other through a common language – English.

In 1854, following Charles Wood’s recommendations, the Company established throughout British India an English-model school system topped by universities teaching British-university curriculum. The Company also established “aided” schools. Privately funded schools that met certain requirements regarding curriculum, staffing, and external examinations could receive government grants-in-aid. The Company forbade mandatory religious instruction in any “aided” schools. This “aided-school” policy encouraged educators to found schools of widely differing religious preferences and accept government money on condition no students were required to attend religious classes.

In 1857 the Universities of Calcutta, Madras, and Bombay were established with affiliated colleges patterned directly after the British university system. 1857 also marked a transition in British-Indian history. Following widespread violence in northern India suppressed by British military retaliation, Queen Victoria replaced East India Company rule with direct rule from Britain’s parliament. India was now the “crown jewel” of the British empire.

In 1883, a retired British-India civil servant, Allan Octavian Hume, addressed a letter to Calcutta University graduates declaring they were the salt of the land and should lead in shaping their country’s future. Partly in response to Hume’s letter, a group of university graduates gathered in Bombay in 1885 and founded the Indian National Congress. One of the Congress’s first acts was to call for greater Indian participation in the British-Indian civil and judicial services (DeBary *et al.*, 1958, pp. 660–663). The Congress also advocated increasing involvement of Indians in determining their own destinies, drawing on principles enunciated by British authors such as Jeremy Bentham, James Mill, and John Stuart Mill whose writings they had studied in college. For generations of upwardly mobile Indian youths, the path to success required an ocean voyage to England, a British higher degree, and a career back in one of India’s growing cities sharing a social life with other middle-class English-educated Indians.

Some Indians were sensitive to the cultural denigration implicit in assumptions of Britain’s intellectual superiority and the need to study for higher degrees in England. Sir Syed Ahmed Khan (1817–1898), an Indian Muslim, studied in England, returned to India and in 1875 founded an Anglo-Oriental College at Aligarh where students could study classical Arabic and learn about the Qur’an and Muslim jurisprudence alongside European knowledge. In 1916 a Hindu, Pandit Madan Mohan Malaviya,

founded Banaras Hindu University where students could learn Sanskrit and Pali and study Hindu, Buddhist, and Jain texts alongside European philosophies and sciences. These two universities' endowments mandated the imparting of Muslim and Hindu instruction respectively. Mohandas Gandhi, who too as a young man travelled to England and earned a law degree, became increasingly critical of British-style education. In the 1930s Gandhi advocated the replacement of British-style education from bottom to top with self-supporting village-level "basic education" schools teaching local languages, training children in village crafts, and preparing them to remain, and improve the quality of life, in India's hundreds of thousands of villages.

Despite the introduction of publicly funded schools by the British during the final century of their rule in India and their establishment of some centers of academic excellence, illiteracy remained a major fact of life in most of India. In 1947, when India became independent, 85% of India's population over age 10 were considered illiterate – 73% of the men and 93% of the women (Davis, 1957, p. 151).

Hinduism in Post-Independence India

The Constitution that came into effect January 26, 1950, stated that India was committed to securing to all its citizens "liberty of ... faith and worship." Article 25(1) declared that "all persons are equally entitled ... freely to profess ... practise [sic.] and propagate religion". Article 27 announced that "No person shall be compelled to pay any taxes, the proceeds of which are specifically appropriated ... for the promotion or maintenance of any particular religion" Article 44 stated that "the State shall endeavour [sic.] to secure for the citizens a uniform civil code" No place of importance was given to Hinduism, the religion most closely associated in the public eye with the Indian subcontinent.

India's Constitution further established that matters of education were to be primarily in the hands of state governments rather than the federal government. The pre-Independence policy of "aided" schools continued in post-Independence India. It fuelled a rapid expansion of privately initiated elementary and high schools, colleges, and universities, with state governments providing supplementary financial support, controlling the curriculum, and administering the examinations. Article 28(3) of the constitution continued the principle of religious neutrality in "aided" schools declaring that no such schools could require their students to participate in religious instruction or worship. This principle was applied across a wide range of institutions: government schools, Muslim madrasas, Sikh schools, Christian convents, Dayanand Anglo Vedic schools, and Ramakrishna Mission educational centers. The relatively even-handed allocation of funds to a wide variety of educational institutions has done little since 1951 to improve educational levels of low-caste and tribal children (Govinda, 2002, pp. 72–95).

According to India's Constitution, in elementary schools throughout India the medium of instruction would be the children's mother tongues, that is, India's regional languages. It was hoped that this would facilitate the rapid expansion of literacy. According to the constitution, India's official language was to be Hindi, a language

spoken in the “Hindu belt” of northern India by about one-third of India’s population. Throughout the non-Hindi-speaking regions of India, Hindi would be introduced in schools as a second language. According to India’s constitution, in 15 years English would be replaced by Hindi, and English would no longer be the official language of India.

Outcries arose in regions of India where Hindi was not spoken. Millions of citizens felt threatened. If the policies enunciated in the constitution were implemented, in less than two decades they would permanently become disadvantaged citizens in their own homeland – disenfranchised because *their* mother tongue was not Hindi. Anti-Hindi protests in the southern states where Dravidian languages were spoken led to threats of secession from the Indian union. Anger against the constitutional policies was expressed in a series of national elections. Finally, in response to the agitation, parliament passed the 1967 Official Languages Amendment Bill indefinitely extending the use of English in India. This brought a temporary end to the anti-Hindi agitation. It also brought a renewed interest in English-medium education. A young English-trained job-seeker could look for work anywhere in India; whereas a Hindi-only or regional-language-only trained job-seeker could look for work only in a specific region of India.

In the 1980s and 1990s, as India increasingly participated in the global economy, students’ and their parents’ demands for English-medium education at all levels increased dramatically. Many primary and secondary schools and most colleges began to provide additional classrooms for students wishing to study in English. Evidence of the high quality of one’s education could be seen in one’s excellence in pronouncing and writing English and obtaining admission into graduate programs in the United States or Great Britain.

During the early decades following India’s Independence school curricula gradually shed their British past. Writings by Shakespeare and Tennyson were replaced by poems by Rabindranath Tagore and Henry DeRozio. Stories of Helen of Troy and the Trojan horse were replaced by episodes from the Hindu *Ramayana*, *Mahabharat*, and *Puranas*. In their textbooks children now read about Lord Krishna and the milkmaids, the monkey-bodied Lord Hanuman, and the elephant-headed Lord Ganesh. At all levels textbooks reminded India’s schoolchildren that Gandhi was the father of India and India had won its independence from Britain by following Gandhi’s nonviolent leadership. Other heroes of the children’s textbooks were the Emperor Ashoka, who renounced war and implemented Buddhist teachings throughout his land and the Emperor Akbar, who, though a Muslim, encouraged interfaith dialogue throughout *his* empire (Elder, 1971).

Policies adopting and increasing the use of regional languages in elementary schools raised fears at the highest government levels that such policies might generate fissiparous tendencies. In time such tendencies might lead to the division of the Indian subcontinent into a collection of small countries with their own languages, flags, and armies. In 1956, the redrawing of India’s internal state boundaries along linguistic lines appeared to some to be an ominous step toward India’s fragmentation. In 1961, to offset these possibilities, the central government set up a National Integration Committee to encourage cooperation between India’s regions and religions. The government

recognized school textbooks as possible vehicles for conveying to children messages of regional harmony, interreligious respect, and national integration. Textbooks carried stories of children from different regions in India – West Bengal, Kashmir, Kerala, Punjab – describing their homes, food, dress, and regional festivals, and stressing that they were fellow citizens of India (Bhattacharya, 1998).

The Partition of the Indian subcontinent into India and Pakistan appeared to some to ease the problem of Hindu-Muslim relationships. Before Partition, Muslims comprised 24% of India's population; after Partition they comprised only 11%. Now that Pakistan existed, Muslims who wanted to live in a Muslim-majority region could migrate to East or West Pakistan. Inside India the only state with a Muslim majority was the former kingdom of Jammu and Kashmir where 77% of the population were Muslims. But Kashmir's inclusion in the Indian union remained disputed.

At the time of India's and Pakistan's independence, over 500 princely states existed on the Indian subcontinent, each of which had been assured by the British that as long as it had a male heir and paid its taxes to the British treasury it could indefinitely retain its semi-autonomous princely state status. Independence and Partition ended those arrangements. Each princely state was required to accede to either India or Pakistan depending on its geographical location within the new national boundaries. For most princes the decision was simple; their state was either inside India or inside Pakistan. For the Raja of the kingdom of Jammu and Kashmir, however, the decision was more difficult. His kingdom adjoined both India and Pakistan; he could, therefore, accede to either country. The majority of Kashmiris were Muslims; the Raja and his family were Hindus. The Raja vacillated. The date for signing the articles of accession came and went; on August 15, 1947 India and Pakistan became independent. Muslim militants in Kashmir took matters into their own hands. Trying to force the Raja to accede to Pakistan, they threatened to overrun Kashmir's capital, Srinagar. The Raja called on India for military assistance. India's Prime Minister Jawaharlal Nehru insisted that India's military units could not enter Kashmir unless it was formally a part of India. Under those conditions the Raja signed the articles of accession – with the understanding that when all foreign troops had vacated Kashmir the citizens could hold a plebiscite to determine whether to join India or Pakistan. Indian army units flew into Kashmir and drove the militants back from the capital (Wirsing, 1994, pp. 39–41). In 1949, the United Nations mandated a cease-fire between India and Pakistan with UN observers stationed along a defined Line of Control separating Pakistan-occupied and India-occupied Kashmir.

Within the next few months all foreign troops did not vacate Kashmir. A plebiscite was *not* held. An uneasy peace settled over the region periodically broken by cross-border incursions and civilian and military deaths. In 1950, India's constitution (Article 370) guaranteed a special status for Kashmir differentiating it from all other Indian states. Inside Kashmir only Kashmiris could own land. Furthermore, the Kashmir state assembly would be allowed to oversee most of its internal affairs except for defense, communications, and foreign policy, where final decisions would remain in the hands of India's federal government. In 1956, seeing no evidence of change in the Kashmir situation, India declared that Kashmir was now an "integral part of the Indian union." Pakistan objected strongly. Between 1965 and 1999 India and Pakistan fought three

wars, in two of which the status of Kashmir played a major role. Each war aggravated tensions in India between Hindus and Muslims, recalling the terrible days of Partition and raising Hindus' doubts about the ultimate loyalties of those Muslims who chose to remain in India instead of joining their Muslim relatives in Pakistan. Within these contexts, India's constitutional commitment granting equal rights to Muslims and Hindus did not go unchallenged. Some Hindus felt that independent India gave special privileges to Muslims inasmuch as the majority-Muslim state of Kashmir enjoyed greater autonomy than any other state in the union, and India's Muslims were not obliged to conform to India's uniform civil code – being informally permitted to observe their own *shariah* law regarding such matters as marriage, divorce, and inheritance. While textbooks declared that all of India's citizens – its Hindus, Muslims, Christians, Sikhs, Jains, Buddhists, Parsis, and others – lived under the same law, it was apparent, nevertheless, that in certain respects Muslims lived under their own Muslim law.

The Rise of Militant Hinduism

In 1924, a Maharashtrian Chitpavan Brahman, V.D. Savarkar, whom the British had previously jailed for terrorism, published a pamphlet titled *Hindutva! Who Is A Hindu?* According to Savarkar, a Hindu was a person who regarded the Indian subcontinent as his fatherland, his holy land, and the cradle of his religion. Savarkar advocated the re-conversion to Hinduism of all former Hindus who had become Muslims or Christians. He described Mahatma Gandhi's nonviolence as "absolutely sinful" and criticized Gandhi's often-expressed concern for the well-being of India's Muslims. During World War II Savarkar coined the phrase "Hinduize all politics and militarize Hindudom." (DeBary *et al.*, 1958, p. 886) Savarkar provided moral support to the Chitpavan Brahman who assassinated Gandhi in 1948 for Gandhi's efforts to protect Muslims. In time *Hindutva* came to mean militant Hinduism.

Savarkar's call for *Hindutva* resonated among various groups in India. The Hindu Mahasabha ("Great Assembly of Hindus"), founded in 1919, elected him president for 7 consecutive years. The Rashtriya Swayamsevak Sangh (RSS) ("National Association of Volunteers") incorporated some of Savarkar's statements into their para-military training of youth volunteers. The RSS adopted saffron, the color of Hindu renunciants' robes, for its flag. The term "saffronization" was applied to efforts to extend *Hindutva*'s ideologies.

Starting in 1951, three Hindu political parties, the Hindu Mahasabha, the Jan Sangh ("People's Association Party"), and the Ram Rajya Parishad ("Council of Lord Ram's Reign") ran Hindu-focused candidates in India's national elections – with mixed results. A cultural movement founded in 1964, the Vishwa Hindu Parishad (VHP) ("World Hindu Council"), sought to invigorate Hinduism throughout India with well-organized rallies and cross-country chariot processions. In 1966, the Shiv Sena ("Shiva's Army") was founded in Bombay, originally to discourage "outsiders" such as south Indians from coming to work in Maharashtra, later to strengthen Hindu positions on political issues.

In 1980, the Bharatiya Janata Party (BJP) ("All-India People's Party") emerged from several parties' reorganizational efforts. Starting by winning only 7% of the seats in India's parliament in 1984, the BJP gained more seats in each subsequent national

election until, in 1995, it won 30% of the parliamentary seats. As the largest party, the BJP was invited to form the national government. However, because of the BJP's links with Hindutva and Hindu "communalism," other parties refused to join a coalition, and the BJP lost that opportunity to form the government. Two years later, in the 1998 elections, the BJP won 33% of parliament's seats and again was invited to form the government. This time the BJP *was* able to organize a coalition government (Puri, 2005).

Militant Hinduism, Educational Knowledge, and Pedagogical Transmission

In its powerful position in the 1998 coalition government, the BJP could finally begin to implement policies it had advocated for nearly two decades. During those decades the BJP had witnessed the Islamization of Pakistan, the Khomeini-ization of Iran, and the Talibanization of Afghanistan. In each case Muslims had molded their political structures to project their religious pride and religious convictions. Now the BJP could try to project its Hindu religious pride and religious convictions through the "saffronization" of India's political and educational structures. The concept of a secular state was criticized as a Western imposition on an intrinsically spiritual India. Educated Indians speaking flawless English were criticized for being modern versions of Macaulay's "brown Englishmen".

During the 1980s and 1990s, such groups as the RSS, VHP, and BJP had begun to write a "saffron" history of India. Based on their interpretation of the Vedic term "Aryan" ("noble ones"), their history declared that the Aryans antedated by 2,000 years the "Harappan-civilization" cities discovered in the Indus river valley by archaeologists in the 1920s (Elliott, 2001). The archaeologists' theories (discredited by later archaeological findings) proposed that sedentary dark-skinned *Dasyus* (referred to in the Vedas) had occupied the cities for hundreds of years before they were replaced by mobile Aryans. Hindutva advocates, despite considerable counterevidence, proposed that the Aryans had originated in India and had developed the original Indo-European language, branches of which eventually spread to Europe to become Greek, Latin, the Germanic languages, and English. According to Hindutva historians, the Aryans in India developed highly sophisticated knowledge of philosophy, psychology, anatomy, medicine, chemistry, astronomy, astrology, physics, and engineering. They developed flying machines, long-range missiles, and weapons of mass destruction. They also developed a superior form of social life and organization spelled out in the Brahmanical literature. In the Aryan golden age, people, fulfilling the duties of their birth-assigned *varnas*, lived in harmony, following ethical principles taught by Vedic sages, Brahmins, and renunciants. The Aryans developed unique forms of music, dance, drama, art, and architecture. Neither famines nor epidemics nor wars disturbed the Indian subcontinent.

After centuries, however, this harmony was disturbed. The disturbances arose from foreign invaders. First came the Muslims, loyal to Arabia, plundering temples, destroying sacred images, and forcing conversions to Islam by the sword. "Muslim" rulers fought "Hindu" rulers until "Muslim" rulers controlled much of the Indian subcontinent.

Then came “Christian” Europeans, loyal to Jerusalem, the Vatican, European nations, or Great Britain who defeated both “Hindu” and “Muslim” rulers, drained India of its wealth through taxation and economic manipulation, and acquired Christian converts by offering them education and government jobs. According to the Hindutva historians, in 1857 Hindu soldiers, supported by Hindu citizenry, rebelled against their British officers in India’s first war of Independence. By 1858 the soldiers and citizenry had been brutally suppressed by the British, but the Hindu fight for independence had been launched. For eight more decades Hindu freedom fighters struggled – violently when necessary – to dislodge the British from India. In 1947 they succeeded. The Hindu citizenry and leaders won India’s independence (Bhambhri, 2001).

Hindutva historians selectively ignored “positive” contributions Muslims had made to India during those years. Missing were accounts of the religiously tolerant Muslim emperor Akbar and such Muslim freedom-fighters as Khan Abdul Ghaffar Khan. Missing also were such magnificent architectural monuments built by Muslims as the Taj Mahal and Humayun’s tomb. Ignored were the forms of art, music, dance, and cuisine incorporating Muslim and Hindu elements, historical documents written in Persian by Indian Muslims, the Urdu language, festivals combining Hindu and Muslim features, sites sacred to both Muslims and Hindus, and accounts of kingdoms with Hindu rulers and their Muslim retainues and Muslim rulers with their Hindu retainues that refused to be defined as either “Hindu” or “Muslim”.

Hindutva historians also selectively ignored “positive” contributions the British had made to India. Missing were the British concepts of the “rule of law” and an impartial judicial system, the network of railways and postal and telegraph services that linked together India’s remotest regions, the English language by means of which Indians working for Indian independence communicated with each other, institutions of higher learning whose graduates participated on a world stage, and internationally acclaimed English-language writers such as Rabindranath Tagore.

According to the Hindutva historians, the British had left India an impoverished third-world country facing a staggering legacy of economic problems. After Partition the British had continued (unsuccessfully) to try to exploit India. But at least the British were gone. The Muslims, however, had remained. As India’s independence was approaching, they had demanded the subcontinent’s partition and a separate Muslim nation. Despite many Hindus’ reservations, in 1947 the subcontinent had been divided, and the Muslims had gotten their Pakistan. But that did not end the matter. Since 1947 Muslims in Pakistan had repeatedly conducted cross-border incursions into Kashmir, killing thousands of Hindu soldiers and civilians. Furthermore, ever since 1947 Muslims inside India had demanded – and gotten – special privileges including a uniquely autonomous Kashmir under the constitution’s Article 370 and preferential exemptions as Muslims from portions of India’s uniform civil code.

To add to the anti-Muslim sentiments they were fanning, Hindutva supporters were identifying Muslim-inflicted historical “wrongs” that now needed redress. One particular target was a mosque built in Ayodhya during the sixteenth century by the Muslim emperor Babur. According to the VHP and RSS, Babur had built his mosque on the birthplace of Lord Ram, hero of the Hindu epic *Ramayan*, after destroying and using in his mosque pieces of a Hindu temple consecrating that spot. In the VHP and RSS

interpretation, Lord Ram, a mythical hero with many attributed birthplaces, became a historical human being with an established time and place of birth. Members of the VHP and RSS defined Babur's mosque as a humiliating relic of Muslim dominance needing to be destroyed and replaced by a temple to Lord Ram. On December 6, 1992 thousands of Hindu activists broke through a protective fence and reduced Babur's mosque to a mound of rubble. Shock waves spread through India's Muslims. Anti-Muslim riots broke out in several cities. Before the rioting ended, hundreds of Muslims had been killed. Again, in 2002, anti-Muslim violence related to Babur's mosque erupted, this time in the state of Gujarat. Once again hundreds of Muslims were killed. In both cases of anti-Muslim violence the BJP did little to halt the violence or punish the perpetrators. If anything, the BJP endorsed the Hindutva construction of history that made Lord Ram into a historical person whose birthplace had been desecrated.

After the BJP's successes in the 1998 elections, the party began implementing its views of Hinduism through India's political structures (Ahuja, 2004, pp. 48–58). The BJP appointed Murlī Manohar Joshi, a BJP supporter, to head the Union Human Resource Development Ministry that dealt with education at the federal level. Joshi had declared he wanted to “Indianize, spiritualize and nationalize” India's primary and secondary schools (Singh/Waghāi). M. M. Joshi, in turn, appointed BJP supporters to key positions in the Indian Council of Social Science Research, the Indian Council of Historical Research, and the University Grants Commission. The Indian Council of Historical Research halted the publication of two volumes of documentary sources dealing with India's independence movement from 1937 to 1947 on the grounds that the volumes were overly secular and Marxist and under-represented the RSS's role in the independence movement. The normally rigorous University Grants Commission began to fund dubious courses in Vedic mathematics and astrology.

In 1999 M. M. Joshi appointed J. S. Rajput, a member of the RSS, to chair the National Council for Educational Research and Training (NCERT) that supervised government curricula and textbook publication. In 2000, J. S. Rajput directed all Central Board of Secondary Education affiliated schools to delete certain “objectionable” pages from current history textbooks. “Objectionable” pages included references to the founder of Jainism not changing his clothes for 12 years before adopting nudity; Tamil Brahmins eating beef; a Muslim ruler being generous to Hindu court musicians; Sikhs, Jats, and Shivaji (a Hindu ruler) “plundering” nearby regions; and British citizens condemning atrocities committed by their own British troops in India. None of these passages fit the BJP view of Hinduism's spiritual superiority over Muslims and Christians.

J. S. Rajput introduced new history textbooks written by BJP supporters. Among these new textbooks' inaccuracies were references to India being the original home of the Indo-European speaking Aryans; castes being unrelated to Hinduism; Muslims bringing into India little except oppression and temple-destruction; and any Muslim rulers who were wise or tolerant originally being Hindus who were converted to Islam. One of the new textbooks describing India's religions failed to mention either Muslims or Sikhs.

Scholars protested the new BJP textbooks. In 2003, a committee of the Indian Historical Congress published a 155-page *History in the new NCERT Textbooks:*

A Report and an Index of Errors criticizing many items presented as facts in the BJP-sponsored textbooks. Scholarly reviewers found the textbooks to be chauvinistic, communally biased, and hostile to the idea of India having a composite culture invigorated by Muslim and European elements.

In India's April 2004 elections India's voters replaced the BJP-led coalition with a Congress-Party-led coalition. The BJP's M. M. Joshi stepped down as head of the Union Human Resource Development Ministry. In his place the winning Congress Party appointed Arjun Singh, who quickly selected a three-person committee to study the controversial textbooks and suggest appropriate next steps. Inside India the "saffronization" of textbooks began to recede. But this did not automatically stop "saffronization" processes outside India. One noteworthy process occurred in far-off California, United States.

Every 6 years the state of California had to approve a list of history books from which school districts could select textbooks. In 2005, some history books that dealt with India contained accurate but "offensive" statements that Hindus had many gods and goddesses, that Hindus considered some people to be untouchables, and that in ancient India men had many more rights than women (Taneja, 2006, p. 78). In California the Hindu Education Foundation and the Vedic Foundation (based in the United States but with links to Hindutva groups in India) requested the California State Board of Education Curriculum Commission to make certain changes that modified history and enhanced the glories of ancient India. Harvard University Professor Michael Witzel, upon learning of the Hindu foundations' efforts, sent a letter to the Curriculum Commission, co-signed by nearly 50 scholars, charging that the recommended revisions were "un-scholarly [and] politically and religiously motivated".

The California Board and Commission found themselves caught in a cross fire. On January 6, 2006, they heard Professor Witzel debate Professor Shiva Bajpai, a supporter of most of the Hindu foundations' requests. After the debate both scholars agreed to a few specific sentence changes. Then the matter was referred to a subcommittee for future reference (Center for South Asian Studies, 2006, pp. 3–7).

When faced with a choice between full academic rigor and cultural sensitivities, the California Board and Commission preferred to err on the side of sensitivity toward those Hindus who, with their families, had moved to California. Militant Hindus among the new arrivals tried to define for other Indians and the California Board a Hindutva view of history and Hinduism that ought to be taught in California's public schools. If their Hindutva views were validated by a school board in the United States, that "international" validation would strengthen their position back in India. As the Indian Diaspora extends around the world, and Hindus describe their heritages to their new neighbors, future debates will occur regarding what did or did not happen years ago on the Indian subcontinent and how that should or should not be incorporated into systems of educational knowledge and forms of pedagogical transmission outside of India.

To return to questions raised at the beginning of this chapter: during the 4,000 intervening years after Brahman priests transmitted knowledge of the Vedas through memorization to the sons of privileged families, what happened in India to the knowledge of those ancient Vedas, to the language in which the Vedas were composed, to the

training in textual memorization by which that knowledge was transmitted, and to the priestly reciters and preservers of the Vedic curriculum?

Today outside India's mainstream educational institutions, the Vedic curriculum is still taught in isolated locations presumably much as it was 4,000 years ago (Fuller, 2003, p. 123). Young men (primarily Brahmans) memorize correctly intoned Vedic passages under the tutelage of Brahman gurus. The Vedas they memorize still include a curriculum of sacrificial formulas, incantations, and magical spells. Priestly reciters of Vedic rituals are still in demand in major Hindu temples today, including Hindu temples in Great Britain and the United States. Sanskrit as "purified" by the fourth-century BCE grammarian Panini is still taught in Indian schools and universities, and Panini's grammar is studied in linguistics departments inside and outside India. Today Kautilya's Sanskrit text on statecraft is read only by the curious antiquarian. In several locations in India today students can earn degrees in Ayurvedic medicine and astrology. Bharata's Sanskrit text on performing arts is still referred to in India's academies of dance and music in efforts to link today's artistic performances with classical Sanskrit aesthetic principles. Today Manu's Sanskrit *Dharma Shastra* is burned in public protests by one fifth of India's citizens, members of lower castes, who define themselves as *Dalits* ("the oppressed") and blame Manu's stigmatization of categories of polluted people for two millennia of their oppression at the hands of India's higher castes (Zelliot, 1972, p. 77).

At most, however, this Vedic knowledge and its curriculum are peripheral to most of India's ongoing educational strategies. India's declared policy of public funds for mandatory education – though still unrealized – is enshrined in India's constitution. Schoolchildren are not required to memorize the Vedas. Training is not restricted to sons of the three highest *varnas*. India's educational policies are heavily shaped by the federal and state governments, both of which have continued, with modifications, much of the curriculum introduced by the British when they ruled India: mathematics, science, regional language, Hindi and English (both India's official languages), geography, history, and literature. By now the classroom materials dealing with geography, history, and literature have abandoned much of their former British content. Instead of reading about Robert Bruce and the spider or the Dutch boy and the dyke, India's schoolchildren read stories of Ram's victory over the demon Ravan, Krishna stealing the butter, and Arjun winning the archery contest and thereby the hand of the princess Draupadi. When not tied to a Hindutva agenda, these stories from the epics and *Puranas* are viewed as common culture narratives rather than as actual historical events that occurred in some fixed times and places. To pass the external English exams in high schools and colleges, students memorize the plots of Shakespeare's major dramas. During the months preceding the annual high school examinations many families hire private tutors to come to their homes before and after regular school hours to prepare their children to write the external examinations, practicing on exam questions from previous years. At college and university levels measures of distinction include admission for postgraduate study in leading universities in Britain and the United States.

India's educational policies have included the founding and maintenance of over 200 universities with thousands of affiliated colleges following the British model, and external examiners and examinations in place to maintain standards of academic

integrity. National policies have included the establishment of Indian Institutes of Technology and of Management that have produced world-class computer engineers, information technologists, and corporate executives. India's educational curricula are selected by state-appointed boards of education – not by Brahman Vedic specialists. The decisions of boards of education, however, are capable of being shaped by the ideologies of those in political power making appointments to the boards of education – witness events during the BJP's 5 years in power from 1999 to 2004. During those years a Hinduism was promulgated that did not exist 4,000 years ago – invented and elaborated as Hindutva in the twentieth century. It was a Hinduism defined largely by rejecting “other” non-Hindu components of India's history – components contributed by Muslims, Europeans (primarily the British), and, more recently, Americans.

India's electorate voted the BJP out of office in 2004 and with it the BJP's educational policies. However, passions will continue to surface regarding India's national identity and, hence, the goals of India's educational system. Is one of those goals to produce contemporary versions of Macaulay's brown Englishmen? Is one of those goals to produce Hindutva graduates denying events in India's history and marginalizing significant portions of India's current populations? Is one of those goals to produce graduates participating in the most significant issues of our time while drawing on the rich histories and cultures of the Indian subcontinent? Or is one of those goals some as-yet undefined Indian participation in the twenty-first century? Regardless of eventual outcomes, for the foreseeable future Indians will continue to debate the usefulness of ancient versus contemporary knowledge; the advantages of rejecting, adapting, or adopting “outside” bodies of knowledge; and the ways in which Hinduism can be incorporated into contemporary education while Hinduism itself continues to change – as it has for thousands of years.

REFLECTIONS ON EDUCATIONAL TRANSITIONS IN EGYPT, LEBANON AND TURKEY

Jennifer Ashkenazi

The historical intercultural encounters between Islam and the West in the Middle East have intrigued numerous historians, political theorists, anthropologists and sociologists. Within this context, one of the most debated topics has been the actual influences of Westernisation on the Islamic World and the actions and reactions of the Islamic World during the periods of intense Westernisation. Education was a key element of the traditional Islamic societies that underwent dramatic change. Alongside its vital role of training new generations of Islamic intellectuals, education was of major importance in the process of spreading new ideologies that accompanied the modernisation of Middle Eastern societies, and in particular, in the emergence of Islamic national movements.

Since the nature of Western influence differed across the states that emerged in the Middle East, it is impossible to point to a single general pattern of development in national education in this area. In order to exemplify the variations and similarities in the changes of knowledge traditions, this chapter will describe and compare the essential characteristics of national education development in three Middle Eastern countries: Egypt, Turkey and Lebanon. The study will concentrate in each country on the negotiations between Islamic educational traditions and modern (Western) reforms. Generally, the crucial moment for each country was manifested in the attempt to create a national system of education, and thereby create national citizens. It will be shown that these key transitions, which occurred in the political and social spheres, and their effects, are still visible today. In their transformations into “modern” nation states, Egypt, Turkey and Lebanon adapted key aspects of Western, often secular, traits into their traditional educational systems; the resulting systems reflected the differences in the political and national developments in each state.

This chapter will begin with a general overview of traditional Islamic education, which was similar in form and content in most Middle Eastern and North African societies. Islam was fundamental not only to education, but was the base of most formal and informal cultural and social institutions and practices.

Islamic Educational Traditions

The Ottoman Islamic empire, from which Egypt, Turkey and Lebanon emerged as nation states, lasted for over 600 years (1299–1922) and is credited with extraordinary

achievements in philosophy and science, in addition to its essential religious philosophy. Education and the acquisition of knowledge were interwoven into Islamic culture and played a central role in a Muslim's life. Major centres of learning existed across the Middle East in Baghdad, Damascus, Isfahan and Istanbul. A tradition of Islamic education, emphasising rhythmical and chanting methods of memorisation, was developed early in medieval times and is still maintained today (Hilgendorf, 2003).

The fundamental theory of Islamic education is based on the first verse revealed to the Prophet Mohammad: *Read, in the name of Thy Lord and Cherisher Who created ... and taught the use of a pen*. Studying, and the transmission of knowledge to others, were fundamental themes in the Islamic tradition and were based on the memorisation, recitation and discussion of the Qur'an, the only text required for Muslims to study (Massialas & Jarrar, 1991, 92 ff). Because of the high value placed on education, mosques became the first schools in Islamic education, in addition to their function as places of worship (Grabar, 1969; Berkey, 2003). The importance of the mosque for Muslims, as a place for gathering and worshipping cannot be overemphasised, for it had implications beyond the religious and social aspects of the community, namely, in the political sphere (Tibawi, 1972). The mosque was and continues to be a symbol of Muslim identity in many communities. According to one scholar, "the first school for all Muslim children, even today, remains the mosque, where he learns to read and memorise portions of the Qur'an and the tenets of the creed" (Saqib, 1983, p. 66).

The early forms of Islamic learning which showed the connection between school and mosque (Berkey, 1992; Lapidus, 1988), focused on younger children and eventually encompassed all ages. Over time, separate free primary schools, the *kuttabs*, were created for young children in order to learn to recite the Qur'an and learn Arabic, the language of the Qur'an. Later on, institutions of higher Islamic learning were established, such as Al-Azhar in Cairo, and a system of preparatory schools called *madrasas* were established to support the higher level of education (Nakosteen, 1964).

Within the system of *madrasas*, the great centres of religious studies were formed. These centres had operated since the Middle Ages and continued well into the eighteenth and nineteenth centuries. The curriculum was relatively standard. The Islamic intellectuals/ men of learning (*ulema*) mastered the following disciplines in order to understand Islamic faith: Arabic grammar (*sarf*), Arabic syntax (*nahv*), *Qur'anic* commentary (*tefsir*), Islamic law and jurisprudence (*fikh*), prophetic traditions (*hadith* or *hadis*), logic and dialectics (*mantik*), rhetoric (*belagat*) and scholastic theology (*kelam*) (Berkey, 1992).

It was important in the philosophy of Islam to provide all Muslims, regardless of social class, the opportunity to learn and participate in the sharing and the propagation of religious convictions. In fact, however, the majority of the students could only attend primary school. Those who attended higher education came from wealthier social classes, or they were supported by *waqfs* (endowments made by individual Muslim believers) (Stanton, 1990). Generally, education beyond the primary school level was not funded by the state.

Upon completion of their education in the *madrasas* the students joined the ranks of the *ulema*, a group of men who had important roles in Islamic society as intellectual, cultural and educational consultants. The *ulema* were also the teachers in the mosque

schools and/or preachers themselves. In addition to their educational roles, they were often called upon to act as mediators between the state and the people in regulating political and social policies.

Important for this study were the changes in attitude of the state towards the *ulema* and the highly stratified system of Islamic education, which existed in the Ottoman empire and its more autonomous region in Egypt. Lebanon also experienced the changes regarding the role of the *ulema*, but the system of religious education differed significantly and followed a different path of development from Egypt. In the 1800s, it had become obvious to the Ottoman leaders that in order to maintain an active role in the European and Asian trade and politics, new kinds of knowledge and techniques were required. To meet this need, a “modern” curriculum, that included Western sciences and medicine, was incorporated into traditional education. The *ulema* had mixed feelings about these innovations. They welcomed change that would strengthen Islamic moral and ethical traditions but felt threatened by reforms which could lessen their authority, claiming that new knowledge from the West may contradict and possibly challenge Islamic values and traditions. Egypt, traditionally an important cultural and educational centre of the Middle East, developed some of the first reforms for the Westernization of its educational system.

Egypt

The early influences of Westernisation in Egypt occurred with Napoleon’s invasion in 1798 and continued under the leadership of Muhammad Ali after 1801. Ali introduced many innovative reforms that laid the foundation for the creation of the modern Egyptian state. A Westernised education system was an important component of Ali’s plan. Although the institutional reforms of the first half of the 1800s did not last long in and of themselves, the spirit of Western education carried enough momentum which ultimately contributed to the disestablishment of Islamic educational traditions and the development of a national education system.

The French invasion and occupation of Egypt lasted only 3 years (1798–1801). During this period, the French abolished the established system of Islamic education, which did not regain its prominent status thereafter. The French founded two schools in Cairo, which were modelled on European patterns. Furthermore, an order given by Napoleon in 1798 provided for Egyptian students to travel to France to study. According to Silvera (1980), Napoleon used education “as a tool to win over the minds of the native elite to the revolutionary principles he incarnated” (p. 3). One of the consequences of this policy was the creation of a separate class of Western- oriented Egyptian intellectuals and state administrators.

From 1801 to 1805, Ali constructed a centralised Egyptian state, albeit within the overarching structure of Ottoman imperial power (Boktor, 1936). Significantly, the *ulema* came to Ali and requested that he take over as *pasha*, signifying his acceptance by the Islamic elites. Although he was respected by the *ulema*, which helped lead to his success, Ali oftentimes bypassed their traditional role in Egyptian society in order to advance his own modern reforms. In addition, he instituted a number of economic

and social changes to Westernise the country. As Saqib (1983) has argued, “[f]or his brilliant projects, aimed at an all-round transformation of his country into a strong, self-sustaining and progressive as well as independent nation, [Ali] has been rightly hailed as the father of Egyptian nationalism” (p. 83).

Ali’s primary targets for reform revolved around the modernisation of the military, the initiation of industrialisation and the development of Western education. His endeavour to establish a modern economy included a major land tenure reform; an extensive irrigation project; the establishment of cotton as a prime crop; the development of a communications infrastructure; the initiation of new trade policies; and industrial development (Issawi, 1961). The land tenure reform abolished the Ottoman practice of tax farming; henceforth, peasants began to pay their taxes directly to the government, which allowed Ali’s new administration to build new factories and to support the improvement of the military. The planting of cotton and the improvement of a communications infrastructure facilitated foreign trade with Europe and Asia, and eased Egypt’s entrance into the international markets. Alongside these social and economic reforms, Ali introduced Western educational ideas, institutions and practices that were closer to his vision of a modern Egypt (Issawi, 1961; Silvera, 1980).

Ali sought to establish a Western-oriented system of schools separated from mosques and different from Islamic educational methods. The general aim was the establishment of a Western type of education, paralleling that of Europe, which would de-emphasise Islamic education and weaken the traditional cultural and political authority of the *ulema*. The de-emphasis of Islamic education, combined with other state administrative reforms, changed the role of religion in Egyptian society.

The Western-oriented system of schools, established under Muhammad Ali, focused originally on higher education institutions with a special emphasis on military education. Soon thereafter, however, he supplemented the system of higher education with public primary and secondary schools, the first time that a system of state-supported mass education was attempted in Egypt. In all of these schools, Islamic elements were de-emphasised in comparison to the secular and military curricula. The first official, fully fledged military school was opened in 1826; other schools connected to military education were established in the 1800s, in part replicating the French model for military education. Although after Napoleon the French were pushed out of Egypt, their authority in educational development continued to be invoked. With the growth of these schools and their secular, Western curricula, a new generation of Western-trained intellectual elite appeared in Egypt, challenging the conventional ideas and norms.

Ali’s Western-oriented reforms, though far-sighted in their aim to Westernise Egypt, were nevertheless narrow in scope. Throughout this period and into the early 1900s, the majority of Egyptians continued to receive elementary religious education in the *kuttabs* (Cochran, 1986). Gregory Starrett (1998) has pointed out that while this period saw the introduction of the idea and form of mass national education and the implementation of various Western reforms, such ideas and reforms did not take root in nineteenth-century Egypt. After Ali’s rule, the systems which he had created, both in education and in state administration, slowly disintegrated under the leadership of his followers. When the British took power in Egypt in 1882, the education system was still primarily centred on the transmission of religious ritual and text in the Muslim *kuttabs*.

An important period in Egyptian history was the occupation and rule of Great Britain, between the years 1882 and 1952. The British did not try to interfere with the Islamic beliefs of the vast majority of Egyptians. In fact, Islamic learning prospered during the early era of British rule (Cochran, 1986). During this early period (1882–1919), very little was undertaken to improve the public (secular) system of education; British educational policy could not be called progressive; it centred mainly in the education of government clerks, who were trained in technical and bureaucratic skills. On a small scale, the British Mandate helped establish a system of public elementary and primary schools: the elementary schools were controlled in large part by provincial councils and only partially by the Ministry of Education, but the primary schools were completely under the direction of the Ministry of Education. However, this system was inadequate for the vast population of Egypt, and no concrete attempts were undertaken to expand or improve the government schools (Tibawi, 1972).

When Egypt gained ‘conditional independence’ in 1922, the education system inherited from the British was criticised by the new Egyptian government. There was no unity in Egyptian education and the system was far from being a comprehensive national system. The Ministry of Education (MOE) tried first to tackle the problem of illiteracy, then to make the elementary system compulsory, and, at the same time, expand the system of the primary schools (Tibawi, 1972). The MOE also tried to unify the religious and secular systems of education and to construct a national curriculum that included Islamic learning. After 1928, the influence of Islam grew in the government schools. In that same year, the Muslim Brotherhood, a grassroots Islamic organisation was founded, and the government increasingly used Brotherhood members as teachers in their schools (Langohr, 2007).

When Egypt gained ‘full independence’ in 1953, the education system was still inadequate for the needs of the country, and not unified, despite the reform efforts of the previous government. There were still a large number of private religious institutions beyond the state’s ability to manage. During the early years of independence, however, this situation changed: the number of primary schools and the student population increased substantially between the years 1953–1963 because of incentives such as teaching a more expanded religious curriculum in the public schools (Starrett, 1998). The religious curriculum in the public schools included not only the material in the textbooks. It was also accompanied by such goals as the inculcation of Islamic morals and values, along with the grasp of the five pillars of Islam, namely, the development of faith in God; acquainting the child with the biography of the Prophet; memorisation of some verses and suras of the Qur’an; and knowledge and practice of the process of ablution and prayer (Starrett, 1998, p. 132). It was also important that the teachers understand the religious curriculum as part of a ‘life’ curriculum, including the home environment and society as a whole.

The main law enacted after Egyptian independence in 1953 established free, compulsory primary education for boys and girls from age 6 to 12 (Tibawi, 1972). The curriculum focused on Arabic, patriotic education and religion, in addition to numerous subjects like arithmetic, history and geography. The government succeeded in luring many students away from the private and foreign schools by the early 1960s because of the promise of free and equal educational opportunities offered in the public system (Cochran, 1986).

It is apparent that educational reform that aimed at Westernisation had a dialectical course in Egypt. In the early days of Westernisation, Muhammad Ali's reforms focused primarily on military education. Ali's system was unsuccessful owing to his failure to integrate the majority of the Egyptian population with the existing Muslim schools. However, despite the failure of his major efforts, Ali had initiated the first reforms to introduce secular and Western education, including a mass school system, into Egypt. Despite many setbacks subsequent to Ali's rule, after 1953 the government succeeded in nationalising and unifying the Egyptian school system.

The case of Westernisation in Egypt also reveals some of the typical conflicts between Islam and secularism. In Egypt, the conflict began during Ali's rule when the religious elites, the *ulema*, were slowly relegated to a lower social and political status in the society. At the same time, the benefits of secular, Western reforms were heralded as advantageous and necessary for the social and economic development of Egypt as a nation state. Hence, when many of Ali's Western reforms failed to produce the promised societal improvements, and the general population was left in the same impoverished condition as before, it was easy to link the secular reforms to the difficulties of the majority of the Egyptian (Muslim) population.

During the 1800s and early 1900s the social and cultural gaps between the secular elites and the religious majorities were a challenge for the Egyptian government and the British Mandate. Following the government's inability to improve the poor social conditions of the lower classes, grassroots Islamic organisations like the Muslim Brotherhood were formed in the 1920s to reach out and help alleviate the situation of these classes. The abject living conditions of these classes became associated with failed Western and secular reforms, thus deepening the conflict between secularism and Islam.

This pattern of conflict between Islam and secularism can be found throughout the Middle East, especially in the previous colonised territories, where secularism has been identified with the Western colonial powers, the disintegration of traditional Islamic cultural norms and the general worsening of social and economic conditions. The conflict between Islam and secularism has been a subject discussed at length in other studies, especially with the recent rise of political Islam (Tibi, 1998; Asad, 2003; Burgat, 2003). It should be noted, however, that despite the popular image that Islam hinders the process of Westernisation and modernisation, one can cite counter-examples, like Indonesia, where there is a 95% Muslim population and a functioning secular government, and Turkey, with an equally overwhelming Muslim population, which has managed to maintain a secular, albeit fragile Republic for over 80 years.

Turkey

The Turkish Republic emerged out of the multi-ethnic Islamic Ottoman empire, a great power that, at its peak, spanned a vast territory stretching from northern Africa, southeastern Europe and western Asia. In the nineteenth century the Ottoman empire began to decline, and after its disastrous participation in the First World War and a 3-year civil war, it finally collapsed. In 1923, after an internal war of independence

the Turkish Republic was established under the leadership of Mustafa Kemal Atatürk. One of Atatürk's top priorities was the development of a secular Western-oriented democratic Turkish – not Ottoman – nation state propped up by an equally secular Western-oriented national Turkish education system. The major aims of modern Turkish education have been to transform Turkish society from its 'traditional' and conservative Ottoman Islamic outlook to a contemporary Western/'modern' nation (Kazamias, 1966; Szyliowicz, 1973; DBerkes, 1998; Kaplan, 2006).

The earliest modern reforms of the Ottoman empire date back to the late eighteenth century and the Imperial Rescript *Nizam-I Cedid* (New Order) issued by Sultan Selim III. This Rescript called for a series of reforms to modernise the Ottoman military and political administration. In the nineteenth century, the reform efforts sought to Westernise the Ottoman administration, the economic system and the education system. In education, efforts were made to introduce Western types of educational institutions with secular curricula for the purpose of educating leaders for public service in the Ottoman empire. Two such institutions are of particular significance: the *Mülkiye*, established in 1859, and the *Galatasaray Lise* which opened in 1868 (Lewis, 1961; Kazamias, 1966). The language of instruction in the *Galatasaray Lise* was French, and its purpose was explicit: "to prepare young men of various religious groups for all the branches of the public [civil] service by providing a higher type of education consonant with the needs of the empire" (Kazamias, 1966, p. 65). The *Galatasaray Lise*, according to Kazamias (2006), was the most secular and Western of all the new schools opened during this period. The curriculum included the following subjects: Turkish, French, Greek etymology, the elements of Latin needed for the study of law, medicine and pharmacy, general and Ottoman history, European and Ottoman geography, mathematics, cosmography, elements of jurisprudence, physics and chemistry, physical history, elements of political economy, rhetoric, geometric drawing, ethics and practical mechanics (Kaplan, 2006). Karpát (2001) has noted that the *Galatasaray Lise* initially attracted non-Muslim students, but with later additions of Turkish courses, the Muslim student enrolment exceeded that of non-Muslim students, further enhancing the school by teaching both Muslim and non-Muslim students. The graduates of both the *Mülkiye* and the *Galatasaray Lise* were influential in the modernisation of the Ottoman empire (Lewis, 1961; Kazamias, 1966; Szyliowicz, 1973).

Unlike Muhammad Ali of Egypt, the Ottoman Sultan Abdülhamid II (1876–1908) tried to harmonise Islamic and Western traditions through Western reforms and the establishment of Western-oriented schools. As part of the Ottoman modernisation/Westernisation process, Abdülhamid II allowed the drafting of an Ottoman Constitution similar to those found in contemporary Europe and he invited European leaders to help with economic reforms and the improvement of the military. In addition to these measures, he promoted Islam along with an Ottoman national identity as common denominators for all the diverse Ottoman ethnic and religious subjects in order to increase solidarity among them. Despite these efforts, Abdülhamid II was unable to realise fully his goals. Owing to the powerful influence of the *ulema*, and the rise of nationalism in the Balkans and the Middle East in the late Ottoman period, his efforts were largely unsuccessful (Berkes, 1998; Karpát, 2001).

The second major modernising/Westernising reform movement took place concomitantly with the establishment of the Turkish Republic in 1923 under the leadership of Mustafa Kemal Atatürk, and under his successor, İsmet İnönü. This second period of reform, also called the Single-Party Era, lasted approximately from 1923 to 1949. Atatürk developed a new national ideology to bolster the establishment of the new Turkish Republic. Called Kemalism, this ideology consisted of six arrows as guiding principles for the new Republic: Nationalism, Republicanism, Revolutionism, Secularism, Etatism and Populism.

Atatürk's reforms entailed a wholesale transformation or "transitology" from an Eastern Islamic empire to a Western secular Republic, by disestablishing the traditional place of Islam in the state administration and promulgating a new, Western national ideology (Kadioğlu, 1996). Secularism also meant a shift of the primary Turkish identity from community and religion to country and nation (Lewis, 1961). The Kemalist version of secularisation disestablished Islam by abolishing the Sultanate and the Caliphate and creating the Directorate of Religious Affairs in 1924. Atatürk's aim was to disestablish the powerful role of Islam and the Islamic elites in Turkish society in order to further his Western reforms (Berkes, 1998; Szyliowicz, 1973; Lewis, 1961; Kazamias, 1966).

An important mechanism for the transformation and modernisation of the newly established Turkish Republic and for Turkish nation building was the modernisation/Westernisation of the educational system. In the new Turkish Republic education was brought entirely under state control and became the prime transmitter of the Turkish republican national ideology and culture. During the formative years of nation-building, the religious schools (*madrassas*) were closed, and Islam, which was seen by the Kemalists as an impediment to Western development, was disestablished.

A definite break from the past was made when the law of Unification of Education was passed on 3 March 1924, declaring that a "modern, unified, secular, egalitarian, and national" educational system must be adopted to ensure that all Turkish citizens were receiving the same standard and quality of education. Religion was officially eradicated from the public school curriculum in 1928, when the clause stating that Islam was the state religion was removed from the Constitution (Berkes, 1998). The Turkish public educational system was now unified under the direction of a central state body – the National Ministry of Education – with a new Minister of Education at the helm. The basic structure of education has remained substantially the same since 1924. However, recent years have witnessed the introduction of reforms that promoted the inclusion of religious schools into the national system and changed the recommended duration of the middle school. The pattern of schooling today consists of primary education, secondary middle education in *orta okuls*, upper secondary education in *liseler* and post-secondary education in state universities, and private colleges or vocational schools.

Although Islam was officially disestablished under Atatürk and secularism became the national ideology, Islamic elements remained in the official administrative and economic spheres, including state education (Akşit, 1991; Yılmaz, 2002). Moreover, while religious education was regarded by the Kemalists as a barrier to modernisation and Westernisation, it was not totally eliminated from the national

system. Instead, it was brought under the control of the state and modified to suit national interests.

Turkey experienced several acute conflicts after the end of the Single-Party Era between Islamic and secular political parties and among political leaders. The 1946 elections, which marked the commencement of the Multi-Party Era in Turkish politics, also marked the beginning of an era of a widespread reaction against the strict secular policies of the Atatürk period. Political parties with Islamic elements had developed and a number of educational initiatives were introduced. These included optional religious courses in the state schools; further support of state-funded religious vocational schools, the *Imam-Hatips*; and the opening of the Faculty of Divinity at the University of Istanbul. These developments were to a degree more or less under the auspices of the Ministry of Education. The loosening of the strict Kemalist secular policies in education, as in other areas, was not supposed to result in a fundamental change of the national secular ideology. Indeed, Kemalist secularism remained the cornerstone of Turkish ideology. Nonetheless, clear directives regarding the place of Islam in secularist Turkey were not decreed by the government. This ambiguous role of Islam in Turkish society resulted in political and social unrest, creating widespread tension between secular nationalists and Islamic religious supporters.

In addition to this tension, the tension between the secular political and military elites and the religious needs of the Turkish people reached new peaks with the rise of political Islam after the 1970s. Henze (1998) attributes the political crisis of the 1970s to a number of factors, not least of which was the cumulative result of the failure of Islamic and secular political leaders to govern effectively. This state of affairs created a hotbed for terrorist activities, which continued to increase and were supported in part by foreign powers. The continuing crisis reached its peak in September, 1980, when following a fundamentalist Islamic demonstration in Konya, the military seized power under the leadership of General Kenan Evren and established martial law that lasted until 1983.

Following the military regime and the accession of Turgut Özal as Prime Minister in 1983, a series of successful reforms was instituted to suppress political and social violence and to stabilise the government. This, in turn, helped to improve the national economy and to strengthen public support for the government. This success was partly based on a new attitude towards the role of Islam in Turkey. Instead of showing aversion towards Islam, the post-1980 governments took several steps to strengthen it: they opened new Qur'anic schools, made religious courses compulsory, and employed new preachers (Yavuz, 1996). This new stance of the Turkish state on Islam was clearly reflected in the new Turkish Constitution promulgated in 1982.

Articles 24 of the 1982 Constitution provided *inter alia* the following:

Education and instruction in religion and ethics shall be conducted under State supervision and control. Instruction in religious culture and moral education shall be compulsory in the curricula of primary and secondary schools. Other religious education and instruction shall be subject to the individual's own desire, and in the case of minors, to the request of their legal representative. (The Constitution, 1995, para. 8)

With these new measures, the Turkish government hoped to avoid any further religious politicisation of the Turkish society, and in the words of Yavuz (1996) “to fuse Islamic ideas with national goals, . . . to create a more socially homogeneous and less politically active Islamic community” (p. 80). Consequently, the Kemalist principles were strengthened and, at the same time, a liberal form of Islam was incorporated into the national ideology, in particular into national education. This development did not evoke the Islamic traditions of the Ottoman empire; Islam was included as part of the moral and ethical lessons in Turkish schools (Özdalga, 1999).

In 1983, Turgut Özal, the head of the Motherland Party, a political party with open Islamic affiliations, was elected as Prime Minister. With the backing of the ever-powerful military establishment, Özal inaugurated a new period in Turkish history, one with a different official approach to Islam and its social role in the modern state (Kadioğlu, 1996). Özal hoped to overcome the polarisation between the secularists and the anti-secularists by instituting a reform in Islam that, in his view, was in accordance with modern conditions. In his view, this reform would make Islam more palatable to the Western-oriented, secularist Turks who resented the strict overtones of the Qur’an and the Sunna.

Özal’s reforms sought to bring about what has been referred to as the Turkish Islamic Synthesis (TIS). The TIS was a philosophy developed by Ibrahim Kafesoğlu and a group of centre-right intellectuals who formed a group known as the Turkish Intellectual Hearth (Turk Ocağı). This group of intellectuals felt that the true Turkish culture was a synthesis of the pre-Islamic traditions and the Islamic traditions of the Turkic people (Copeaux, 2000). They held that Islam was an important cultural and historical tradition and should be part of contemporary Turkish society. Additionally, the Hearth advocated state control over Islam. In keeping with this philosophy, the Özalist reforms to a large extent were an expansion of state control over religious areas, including education (Akarsu, 2000). Özal’s perception of religion and its role in the society mirrored the synthesis of secularism and Islam, which would not threaten the Western secular aspirations of the Kemalists, but would make Islam a fundamental element of Turkish identity. The TIS was seen as a cure for the political and social unrest by both the religious leaders and the military regime. This continuation of Islamic values became part of the educational system.

The major educational reform of this period was the implementation of compulsory religious education, which was thought to answer a public call for morality and ethics in Turkish society. The system of semi-private *Imam-Hatips*, which had operated partly under the auspices of the state since the 1950s, was greatly expanded by the 1980s. However, the language of the national policies was vague and inconsistent; the TIS was not successful in helping to develop a practical framework for state policy beyond offering some general philosophical guidelines.

After these reforms were introduced, Islamic instruction was expanded across Turkey. It is important to keep in mind, however, that Islam was never entirely eliminated from the schools of Republican Turkey. Instead, it was brought under state control with a series of new Western-styled laws and religious reforms. In the 1980s, when the Turkish Republic reintroduced Islam into government policies and into the Constitution, religious education was made compulsory. This action strengthened the place of Islamic education in the schools and in the Turkish society.

In the 1990s, following the Özal era of support and tolerance for Islam, the place of Islam in Turkey and in its national education system again became controversial. The military's strict position on secularism remained the same, despite their tolerance for Islam in the early 1980s. When the number of students enrolled in the semi-private religious *Imam-Hatips*, grew to an unprecedented proportion (to almost 10% of the student population in 1997), the military intervened and forced the government to change the number of years of compulsory education to 8 consecutive years of regular public (secular) education (Özdalga, 1999). Until then, students attended 5 years of regular public schools and then they could attend the *Imam-Hatips* in order to fulfil their compulsory education obligations. The *Imam-Hatips* offered a broad range of religious curricula in addition to the standard public school curricula, and they were a popular choice for religious conservative families for their children. While this reform did not affect the compulsory religious education of the public schools, it indicated the lack of patience by the secular military establishment for a type of education that did not fall within the framework of Turkish national education, which guaranteed equal (secular) education for all students.

The current political situation in Turkey further reflects the tension between secular and Islamic interests. In the spring of 2007, large demonstrations took place in Ankara, the capital, in protest against Prime Minister Recep Tayyip Erdoğan, a conservative politician with a pronounced Muslim background, and his campaign to elect Abdullah Gül, a person known for his Islamic affiliations, as president of the Turkish Republic. Erdoğan's intentions sparked a strong opposition from secular Kemalists, who felt that the presidency should remain a secular political stronghold (*Turkish News Daily*, 21 April 2007). Following a strong opposition by the secular Republican People's Party and warnings by the military, Gül withdrew his candidacy. Erdoğan then called for general elections which were held in July, 2007, at which Erdoğan's ruling Justice and Development Party, a centre-right party with Islamic affiliations, won by a landslide, having garnered 46.6% of the votes cast (Bozkurt, 2007).

Turkey was and is a unique case in its implementation of secularist policies. The state control of religion did not imply separation between religion and the state, and certainly did not imply the removal of Islam from the ostensibly secular Republic. The degree to which Islam and Turkish nationalism can coexist without significant tension and instability, however, remains to be seen.

Lebanon

Unlike Egypt and Turkey, Lebanon is known for its multi-sectarian population that includes the following religious communities: Maronite, Sunni, Shi'ite, Greek Orthodox, Greek Catholic, Druze, Armenian Orthodox, Armenian Catholic, Protestant, Jewish, Latin (Roman Catholic), Chaldean, Syrian Orthodox, Syrian Catholic, Alawi and Bahai (Crow, 1962). The extreme heterogeneous nature of the society has also made Lebanon vulnerable to internal conflict that has been reflected in civil hostilities from the 1860s until the more recent tragic civil war of 1975. The varied nature of sectarian expansion has been responsible for the unique national development of Lebanon. The lack of a

common national ideology between the Christian and Muslim confessional groups is reflected in the educational system, which was influenced by various religious traditions and which the state administrations have never succeeded in completely centralising.

Alongside the small state system of schools, each religious community has historically been given the right to maintain a private system of education according to a tradition that began with the period Ottoman rule (1516–1918); it continued under the French Mandate (1918–1943); and it has been sustained under the current administration (Crow, 1962; Hudson, 1985; El-Solh, 2004). After the French Mandate began in 1920, the borders of the State of Greater Lebanon were expanded to include coastal regions and the Beqa Valley. This expansion dramatically altered the population make-up because the citizens of the acquired regions were primarily Muslim. This development succeeded in eliminating the Christian majority and creating a population comprising several large religious communities (Crow, 1962).

There were two main thrusts of Westernisation in Lebanon: the first appeared with a burst of missionary activity in the second half of the 1800s and the second, under the French Mandate between approximately 1920 until 1943. Whereas other Middle Eastern nations, for example, Egypt, Turkey, Iran, Iraq and Jordan developed Western and national education systems for military and secular purposes, in Lebanon Western education was introduced under the auspices of private missionary, and hence religious groups (Szyliowicz, 1973). Beginning in the 1600s, Jesuit, Capuchin, Lazarist, Maronite, Greek orthodox, Catholic and Quaker missionaries all founded schools and churches in Lebanon (AMIDEAST, 1993). In the 1800s, Sunni Muslim and Druze communities established their own schools to protect their cultural interests from foreign Western influences (Abouchedid, 2002; Frayha, 2003). These schools began a long-lasting tradition of formal education outside of the state system, based on private and religious community affiliation.

The majority of the private and foreign schools established were based primarily on French educational models (Massialas & Jarrar, 1991). Curricula were heavily influenced by the respective communities and the language of instruction was either French or English, reflecting the large number of European and American missionaries who valued educational freedom in Lebanon. Educational initiatives organised by the various missionary and private groups intensified existing cultural rifts and sharpened regional perceptions of identity. Although a state system of schools existed during this period, the perpetuation of sectarian differences strengthened regional values and objectives, and thwarted eventual efforts by civil authorities to promote a national social and cultural ideology, let alone a unified curriculum.

Western education in Lebanon was more pronounced in higher education. Two universities founded during this period were the American University of Beirut (1866) and the University of Saint Joseph (1875). Considering their American and French affiliations, respectively, and their Western and modern intellectual orientation it is interesting to note that one of the first formal political parties in Lebanon that called for Christian/Muslim cooperation for social unity was organised at the American University of Beirut (AUB) (Frayha, 2003; Barakat, 1977). However, admission into these institutions depended on university entrance examinations, which were part of the foreign schools and easier for the students of those institutions to pass. Students

of the state schools found it difficult to attend higher education because they were not trained properly for the entrance examinations.

The unequal system of elitist foreign and private education was perpetuated after the end of the First World War, when the Ottoman empire was defeated. In 1920, France was granted a Mandate in Lebanon that established the Greater Lebanon (Khalifah, 2001). The French crystallised the fragmented nature of Lebanon in granting a large degree of autonomy to individual confessional communities, giving priority to the Maronite Christians in order to increase French political control in the region (Khalifah, 2001; Hudson, 1985). Under the French Mandate the state administration was dramatically modernised; Lebanon 'acquired' a National Constitution in 1926, a parliament elected by popular vote, a president elected by the parliament, a council of ministers, an independent judiciary, a modern fiscal system and a national policy of education.

However, the French did not have the resources, or the motivation, to nationalise the extensive system of private and foreign schools in Lebanon and instead opted to create three systems consisting of state, foreign and private schools. In effect, the French were not able to unify the social divisions which had existed for decades in the education system. They opted, therefore, to link the public school system with the systems of private and foreign schools. This manner of maintaining the unequal educational opportunities has been perceived as an attempt to preserve the French Catholic influence in Lebanon (Frayha, 2003).

After Lebanon gained complete independence from France in 1943, education was assigned the important role of helping to create a common sense of Lebanese national identity. The major confessional groups in Lebanon agreed to the National Pact of 1943, a treaty that established a base of political cooperation among the different groups for the founding of an independent national state, a common government and a geographical political entity (Baaklini, 1976). In the creation of a national education system that was not to be based on religious affiliation, the Lebanese government centralised all education, including the various sectarian schools: new educational legislation was enacted and the use of textbooks was thereafter supervised by the Ministry of Education (Frayha, 2003). Although private schools continued to operate, they were required to implement the same curricula as public schools under the supervision of the government. It was important for the new government to emphasise Lebanese national principles and values and not religious affiliation. This goal was clearly salient in the 1943 Lebanese Government Platform, which stated the following:

The time of national awakening in Lebanon's history shall be when we can abolish Taifiyah (sectarian conflict). ... From now on, the government will offer the Lebanese youth an appropriate citizenship education and orient them toward freedom, independence and national pride. Therefore, the government will use all necessary means to enhance Arabic, the country's language, as well as Lebanon's history and geography in all educational institutions. (reprinted in Fraya, 2003, p. 82)

Furthermore, in 1950 a decree was issued that required that all private schools be subjected to national supervision (Abouchedid, 2002).

Despite the efforts to centralise state administration and create a national ideology the religious differences proved too convoluted for the sectarian schools to be effectively governed. Political disagreements between the sectarian groups about the appropriate formation of a national identity, among other inter-regional conflicts, culminated in a civil war in 1958, and later in 1975. Different educational reforms were instituted in order to try and surmount the lack of national integration. The most recent of these plans was the 1989 Ta'if Agreement, approved by the Chamber of Ministers on 10 November 1993. This agreement stressed the importance of national upbringing and “essential” values like democracy, tolerance and the elimination of violence. It called for three main objectives to standardise history and civics textbooks and their mandatory instruction in Lebanese schools, to protect private education, and to reinforce the public sector of education (Abouchedid, 2002, Frayha, 2003). Despite the attempts to unify education, the government has been unable to fulfil its goals in education, and there are no clear government directives about the teaching of religion because of the sensitive nature of the subject (Abouchedid, 2002). Furthermore, the private schools continue to teach religion according to their sectarian traditions.

Historical Perspective on Western Education in Nation-Building in the Middle East

In the Middle East and North Africa Western education was seen as an important tool in the reorganisation and reorientation of traditional Islamic nations to become part of the ‘West.’ It appears, though, that alongside the major Westernisation reforms that occurred in Egypt, Turkey and Lebanon, a strong tendency towards Islamic traditions remained, and has continued to exist in the national schools. Formal education presents a particularly compelling subject to study, as it demonstrates the multiple factors involved in the negotiations of Westernisation and nationalisation in traditional Islamic societies.

Formal education has a rich tradition in each of the nation states examined here, reaching back to the early days of Islam. However, these nation states also share a similar trajectory of Western educational reforms beginning in the eighteenth and nineteenth centuries. In the case of Egypt and Turkey, students were sent to Europe to study for the purpose of strengthening national military power. In all three countries, a separate, typically secular, school system based on Western European models and emphasising non-Islamic curricula was set up; and, in the case of Lebanon, a private system of foreign missionary schools that provided the basic structure of the current Lebanese multi-sectarian educational system was established. Over the course of many years, the established Islamic educational traditions were undermined by Western schools the graduates of which created new elites, who were active in the national development of their respective societies.

Given that formal education had become a prime transmitter of new national cultures, the educational character and the curriculum shared common elements in all three nation states. In Egypt and Lebanon, the French influence was predominant. In the Islamic Ottoman empire Western schools and curricula were introduced, and in the

Turkish Republic that emerged from the defunct Ottoman empire in 1923, a secular national system of education was established. However, Islamic schools continued to function and only rarely were they integrated into the Westernised systems.

Although the above case studies share common elements, they also demonstrate different patterns of educational development. Whereas in Egypt and Turkey educational reform was introduced by the state in order to improve the military and to create Western-style state administrations, in Lebanon Western education was introduced by the missionaries. In Egypt Western reforms were uneven and inconsistent. The erratic reform movements created numerous problems and conflicts between grassroots Islamic organisations and the government elites. As a consequence, the state included Islam as part of Egyptian nation-building. Conversely, when Atatürk came to power in 1923, secularist policies were actively pursued by the Turkish state and since then a secular nationalism has been widely espoused. The severe sectarian differences in Lebanon have caused major difficulties in attempts to unify the religious communities, and a representative nationalist movement did not develop.

In many Middle Eastern societies, a dual-, and in the case of Lebanon, a tri-, system of education developed. Most governments did not have the resources, or indeed the incentive, to launch full-scale educational, political, social or economic reforms. In Lebanon and Egypt, the French and British Mandates simply maintained the inherited status quo. Hence, the rift between the elite classes and the general population deepened. Specifically for education, this disregard for incorporating the wider national population into the school system contributed to problems that are still evident today.

Although traditionally Islamic education was the main form of schooling in Egypt, Turkey and Lebanon, this changed dramatically in the face of Western, often secular, educational reforms. National education in each of these new nation states developed concurrently with nationalist movements both of which were greatly influenced by the West. The new Western-oriented elites sought to develop national state systems, but each nation state adapted educational reforms to suit its specific needs. Islamic education continued to exist in private and in public schools often contrasting sharply with the national reforms. However, the Islamic lessons were tailored to accommodate the state's objectives, not to recreate the Islamic learning of the former eras. The expansion of national education reflected the unique balance found in each respective nation between Islamic traditions and Western influences, highlighting how Islam retained an important presence in society, alongside, sometimes despite, official policies.

CHRISTIANITY, MODERNITIES AND KNOWLEDGE

Gerald Grace

In the notes of guidance to the contributors to this volume, the editors assert that

[a]s the nature of educational sites alters in late modernity, the issue of educational cultures and pedagogic identity becomes powerfully de-linked from notions of citizenship and more and more powerfully linked to economics or to religion. The framing of the topics of culture, knowledge and pedagogies is thus changing rapidly and a comparative education of the future must work out new ways to analyse the theme of identity.

This chapter will attempt to assess that contention with particular reference to the socio-theological and educational cultures of two forms of Christianity.

From Sacred Christian Knowledge to Secular Market Knowledge

In *Pedagogy, Symbolic Control and Identity* (1996), Basil Bernstein reflected theoretically on the significance of these issues and it is clear that his insights provide a valuable starting point for a 'comparative education of the future'.

Bernstein outlines a major cultural transformation which can be discerned in Europe (and internationally), from a faith-based conception of knowledge and pedagogy to a secular, market-based conception of education. Historically, official knowledge and the curriculum and pedagogy derived from it in Europe were realisations of Christian religious culture in pursuit of a greater understanding of God:

The Christian God was a god you had to think about. It was a god that not only was to be loved, but to be thought about. And this attitude created an abstract modality to the discourse. (Bernstein, 1996, p. 83)

Educational discourse in the medieval university or 'school' involved exploration of the Word and exploration of the world, 'Word and world held together by the unity of Christianity' (ibid).

The fundamental Christian regulative principle of school knowledge and pedagogy was the existence of God and the incarnation of Jesus Christ, whose natures could be partly apprehended by the study of sacred text and partly by exploration of the created universe. Culture, knowledge and pedagogy were strongly framed within the Christian revelation and world view as mediated by the Catholic Church as the dominant Christian institution.

This religious regulative principle was, in Bernstein's view, progressively replaced during the Renaissance and the Enlightenment by a 'humanizing secular principle', representing the stage of early modernity, but this principle is now being replaced by a 'dehumanizing principle' of market commodification of knowledge and pedagogy in late modernity. The argument is elaborated in these terms:

Today, throughout Europe ... there is a new principle guiding the latest transition of capitalism. The principles of the market and its managers are more and more the principles of the policy and practices of education. Market relevance is becoming the key orientating criterion for the selection of discourses. ... This movement has profound implications from the primary school to the university.

There is a new concept of knowledge and of its relation to those who create it and use it. This new concept is a truly secular concept. Knowledge should flow like money to wherever it can create advantage and profit. Indeed, knowledge is no longer like money, it *is* money. (Bernstein, 1996 p. 87)

Accompanying this secularisation, commodification and marketisation of knowledge in contemporary settings, there are comparable transformations in pedagogic discourse and communication. Pedagogy is not simply a means for the transmission of knowledge, it is also a powerful regulator of consciousness and a formative influence upon personal identity.¹ Pedagogy in the secularised market curriculum has itself become dominated by output measures of specific competences and skills, by performance models of comparative achievement levels and by efficiency and effectiveness criteria relating to the 'delivery' of the required objectives of prescribed curricula. It follows from this analysis that student consciousness and sense of identity and personal worth will be affected in particular ways by what Bernstein has described as 'a virtually secular pedagogic discourse' (p. 80).

Faced with these profound changes in the framing of culture, knowledge and pedagogy in early and late modernity it is important to examine the educational responses which have been made by both Catholic and Reformed Christianity.² The development of secularisation in the modern world from the Enlightenment to the present day presents agencies of sacred culture with a powerful challenge. Secularisation represents the denial of the validity of the sacred and of its associated educational cultures and its attempted replacement by logical, rational, empirical and scientific intellectual cultures in which the notion of the transcendent has no place. Secularisation involves a significant change in the cultural power relations of any society. While secularisation changes intellectual and cultural power relations it also operates to affect the world view of many individuals so that religious concepts, religious discourse and religious sensitivities are simply irrelevant to the everyday business of life. This is what Berger (1973) has called 'a secularization of consciousness'.

Reformation and Counter-Reformation in Education

Giddens (1991) in *The Consequences of Modernity* argued that secularisation had significant consequences for an understanding of what constituted knowledge:

Religious cosmology is supplanted by reflexively organised knowledge, governed by empirical observation and logical thought and focused upon material technology and socially applied codes. (p. 109)

What his analysis overlooks is, that while there has been (in the West) what could be called a secular reformation in the culture of knowledge, pedagogy and educational processes there has, at the same time, been a religious counter-reformation in which Catholic Christianity has been prominent.

Commenting on the nature of the current secular reformation (the second reformation), Bauman (2000) argues that its central idea is that of 'human rights', especially as expressed in freedom of choice regarding beliefs, values and actions. A strong form of autonomous individualism marks this stage of late modernity or early postmodernism. A powerful idea is that the identity of the person can be constructed from whatever cultural elements the individual chooses – a construct which Gellner (1996) calls 'modular man' (and woman).

Christian educational agencies (and those of other faiths) exist as part of a counter-reformation in modernity which relates the formation of human persons to religiously given beliefs, values and principles and not to an entirely self-determined modular process.

In terms of identity formation the Enlightenment sought to replace the concept of religious believer and church member with that of rational citizen and civic participant. In late modernity, according to Bernstein, the attempted ideological transformation is from that of citizen to that of consumer and 'market player'.

Whatever else globalisation represents, it seems clear that it involves an attempted marketisation of cultures and societies worldwide, with challenging implications for educational systems. These challenges are especially sharp for faith-based as opposed to secular schooling systems.

The Challenges of Early Modernity: The Educational Responses of Catholic Christianity

The challenges of early modernity were constituted for the Catholic Church by the Protestant reformations of the sixteenth and seventeenth centuries and by the cultural effects of the Enlightenment in the eighteenth and nineteenth centuries. The Protestant reformations threatened the Church's control of culture, knowledge and pedagogy and its hegemony in the religious and spiritual domain. The Enlightenment and its consequences more radically threatened the very idea of the Christian God and of the culture of the sacred.

In his classic study, *The Evolution of Educational Thought* (1938) Emile Durkheim characterised the Society of Jesus as the leading Catholic agency in countering the

challenges of both Protestantism and secularism in the early modern period. For this reason he assigned three chapters of his book to a close examination of Jesuit educational culture – its curriculum, pedagogy and assessment. Durkheim recognised the remarkable significance of the Jesuits in shaping and forming Catholic curricula and pedagogy in Europe. Their intention was to create an intellectually stimulating Christian engagement with classics, theology, philosophy, history, literature, music, art and drama. An emphasis upon rhetoric, disputation and debate was designed to produce the ideal Jesuit student who would become a confident apologist for the Faith. The humane studies of a Jesuit education were intended to form Catholic intellectuals and men of public affairs whose scholarship confirmed the truths of the Catholic faith and who could confidently articulate these in exchanges with Protestants, secularists and atheists. While Jesuit pupils, in the words of Durkheim, ‘lived amidst a flurry of written assignments’ (p. 255), the ultimate purpose of these assignments, whatever the subject, was to illuminate God’s design for the created world and to form in the pupil a sense of service in relation to this grand design. This was an education intended to generate a vocation to serve others – at its best, by commitment to the clerical or religious life or in various lay professions for the general good.

The year 1999 marked the 400th anniversary of the publication of the *Ratio Studiorum* or ‘The Plan and Methodology of Jesuit Education’. In a commemorative volume published in 2000, various Jesuit scholars reflected upon its significance, its impact and future in the face of new challenges.³ It was understood that the influence of the *Ratio* and its educational culture had spread far beyond Jesuit schools and colleges. Many subsequent religious orders with missions in education had been influenced to a greater or lesser extent by Jesuit educational experience. The Institute of the Blessed Virgin Mary, The Society of the Sacred Heart, and other religious orders were directly affected by Jesuit educational methodology.⁴ However, probably the greatest impact of the Jesuits is to be found in the example they provided of an active religious order with an educational mission. This set the pattern for the Catholic Church’s response to the challenges of early modernity. The following centuries witnessed a multiplication of new religious orders and teaching brotherhoods and sisterhoods dedicated to the vocation of education. The Catholic response to the challenges of early modernity was to generate specially trained men and women in organised formations dedicated to the work of Catholic education. The prime knowledge to be transmitted was the truths and doctrines of the Catholic faith and the pedagogy of the catechism was the dominant form. At the same time great emphasis was placed on traditional forms of academic achievement, moral formation and a strict disciplinary regime. The Catholic religious orders founded in early modernity were, in effect, missionaries of education against the twin dangers of Protestantism and secularisation. Their educational regimes were designed to work at all levels of society, from governing elites to the urban and rural masses. The range of their operations extended across the whole world as they followed the injunction of their Founder to ‘go and teach all nations’.⁵

At the heart of this great Catholic educational response to the challenges of early modernity were concepts of doctrinal certainty and vocational calling. Against the questioning of secularism, the existence of God was to be asserted and in various ways ‘proved’. Against the innovations of Protestantism, the eternal validity of Catholicism

and of the Catholic Church was reasserted. Permeating the whole system was the regulative principle of 'finding your vocation'. Catholic education was the means by which youth could find their calling from God – their vocational destiny in the service of God.

This destiny might be that of Catholic parenthood and lay occupations of various kinds (with public service professions strongly favoured) or the ultimate vocation of service to the Church in clerical or religious life. While so many Catholic teachers of this era were themselves members of religious orders the concept of a vocation in the service of God was a daily incarnation in the classroom lives of the pupils and students. The vocational word was, in this sense, 'made flesh' in the presence and the conduct of their teachers. Everything else in the system, the academic curriculum, the moral formation, the social and community bonding was there to facilitate the student in finding his or her approved vocation in the service of God (and the Catholic Church). This is the essence of a Christian faith-based schooling system, that is, the search for the nature of God especially as revealed in the Person of Christ and the search for God's purposes in vocation for the individual student. This system, as Bernstein (1996) has argued, was faced with considerable challenges in the cultural transformations of late modernity.

The Challenges of Late Modernity: The Educational Responses of Catholic Christianity

In late modernity the Catholic Church faced a world situation characterised by a more pervasive culture of secularism and materialism than it had ever before encountered. In particular it faced an international cult of perpetual consumerism propagated by the many agencies of global capitalism and an international situation marked by sharper divisions between rich and poor nations.

The Catholic Church, under the inspiration of Pope John XXIII, had itself undergone an attempted spiritual, religious, moral and social transformation in the proceedings of the Second Vatican Council (1962–1965). As Adrian Hastings (1991, p. 525) has argued:

[T]here can be no question that the Vatican Council was the most important ecclesiastical event of the century. ... It so greatly changed the character of by far the largest communion of Christendom.

The new spirit of Vatican II had considerable radical potential. This potential involved attempts to develop a new conception of the Church as not simply clerical but constituted as 'the people of God'; a move away from papal fiat towards greater collegial authority; a new principle of openness and dialogue with the world, other Christian denominations, other religious faiths and with 'all people of good will' regardless of faith; a renewed corpus of Catholic social teaching centred upon 'a preferential option for the poor' and a new conception of sin, as not merely individual failings but also social and structural failings. A changed socio-political stance in international relations involved a move from the traditional denunciations of Marxism and

of communist regimes (as atheistic and oppressive) to a more extensive criticism of structures of oppression and exploitation – ‘structures of sin’, constituted in global capitalism, in race relations (apartheid in South Africa) and discernable in various parts of the world, for example, Latin America.

In 1977, the Sacred Congregation for Catholic Education issued from Rome a foundational document, *The Catholic School*, which powerfully expressed the new spirit which it was hoped would characterise Catholic education internationally. This document inaugurated a post-Vatican II conception of what a Catholic Christian education should be in the era of late modernity. Any attempt in a ‘comparative education of the future’ to evaluate Catholic school systems from the standpoint of values, knowledge, pedagogy, identity and social relations, must use as its theoretical framework this ‘foundation charter’ for contemporary Catholic education. As there is little understanding of these principles in the secular academic world, they need to be stated here in some detail.

Foundation Principles for Catholic Education in the Era of Late Modernity

On the Distinctive and Necessary Role of the Catholic School

There is a ‘pressing need to ensure the presence of a Christian mentality in the society of the present day, marked, among other things, by cultural pluralism. For it is Christian thought which constitutes a sound criterion of judgement in the midst of conflicting concepts and behaviour: reference to Jesus Christ ... teaches the values which ennoble from those which degrade’.

Cultural pluralism leads the Church to reaffirm her mission of education to ensure strong character formation. Her children then will be capable of both resisting the debilitating influence of relativism and of living up to their baptism. For this reason, the Church is prompted to mobilise her educational resources in the face of the materialism, fragmentation and technocracy of contemporary society’ (pp. 15–16).⁶

This section of the charter stressed the importance of the critical role of Catholic schooling in late modernity. The role of the Catholic School was counter-cultural.

Later statements from Rome suggested that modernity has become associated with the unrestrained pursuit of profit and of technological innovation to the detriment of the spiritual and moral formation of persons. Catholic schools internationally have been called upon to be counter-cultural to these tendencies.

Catholic Schools and Human Formation

‘A school is not only a place where one is given a choice of intellectual values, but a place where one is presented with an array of values which are actually lived. ... Christ is the foundation of the whole educational enterprise in a Catholic school ... the Catholic school aims at forming in the Christian those particular virtues which will enable him⁷ to live a new life in Christ’ (pp. 29–33).

Catholic educators are to resist the reductionism of education as academic achievement only. The formation of values and virtues is crucial to human development in the contemporary world.

Against the many dramatic and glamorous role models provided by a modern media culture permeating the world, Catholic schools are encouraged to continue to project to Catholic youth, the Person of Christ as the most perfect guide for living and human formation.

Integration of Faith and Life

‘The Catholic school has, as its specific duty, the complete Christian formation of its pupils and this task is of special significance today because of the inadequacy of the family and society. ... Young people have to be taught to overcome their individualism and discover, in the light of faith, their specific vocation. The very pattern of the Christian life draws them to commit themselves to serve God ... and to make the world a better place to live in’ (p. 37).

The important role of the Catholic school in assisting young people to find their God-given vocation is again reasserted. Generating a culture of vocation is seen to have heightened significance because of contemporary tendencies to think in terms of ‘good jobs’ only, to the detriment of notions of a ‘calling’ or a ‘vocation’.

Catholic schools are expected to develop educational cultures in which faith, reason and life are brought into an integrated relationship as a holistic educational experience. From this perspective, the understanding of particular academic subjects and of particular vocational possibilities should be strongly framed within the perspective of the Faith.

On Knowledge

‘Education is not given for the purpose of gaining power but as an aid towards the fuller understanding of and communion with man, events and things. Knowledge is not to be considered as a means of material prosperity and success, but as a call to serve and to be responsible for others’ (p. 43).

The authors of *The Catholic School* saw an external world in which knowledge itself was being transformed into a market commodity associated with power, wealth and personal status. Their argument in this section was that Catholic educational knowledge was not to be seen only in terms of individual personal empowerment but rather as empowerment for social purposes. The commodification of knowledge in late modernity was to be resisted.

Catholic schools were called upon to resist an individualistic ‘success’ culture and a market conception of knowledge by holding to traditional conceptions that knowledge entails service to a larger good.

On Teachers as Witnesses

‘The Catholic school depends not so much on subject matter or methodology as on the people who work there. The extent to which the Christian message is transmitted through education depends to a very great extent on the teachers. ... The nobility of the task to which teachers are called demands that, in imitation of Christ ... they reveal the Christian message not only by word but also by every gesture of their behaviour.’⁸ This is what makes the difference between a school whose education is permeated by the

Christian spirit and one in which religion is only regarded as an academic subject like any other' (p. 36).

Lay teachers were encouraged to follow the example of their predecessors, the religious, in being witnesses for Christ. The transmission of the charisms of religious congregation to their lay successors would be essential to preserving the distinctive roles of Catholic schools in society.

In effect, the Church was attempting to encourage Catholic lay teachers and school leaders, who now constituted the majority of the personnel in schools, to become inheritors and models of the charisms of the declining religious orders in education.

Catholic Schools and Social Justice

'Since it is motivated by the Christian ideal, the Catholic school is particularly sensitive to the call from every part of the world for a more just society. ... In some countries, because of local laws and economic conditions, the Catholic school runs the risk of giving counter-witness by admitting a majority of children from wealthier families. ... This situation is of great concern to those responsible for Catholic education, because first and foremost the Church offers its educational service to the poor to those who are deprived of family help and affection or those who are far from the faith' (pp. 44–45).⁹

There is evidence here of concern that too many Catholic schools internationally were in the service of the rich rather than the poor. A danger for Catholic schooling in late modernity was that despite a rhetoric of service to the poor, it might in practice not be realising this foundation principle.

Catholic school service to elite students had historically been premised on the belief that the future leaders of society could be 'converted' to the service of the poor by religious and moral teaching.

The Second Vatican Council called for more direct engagement with the education of the deprived and the powerless, by a commitment to 'a preferential option for the poor' in schooling.

Catholic Schools and the Common Good

'The Catholic school community is an irreplaceable source of service. ... Today, one sees a world which clamours for solidarity and yet experiences the rise of new forms of individualism. Society can take note from the Catholic school that it is possible to create true communities out of a common effort for the common good' (p. 47).¹⁰

The authors of *The Catholic School* saw a late modernity marked by the growth of acquisitive and competitive individualism, encouraged by global capitalism. This was an attempt to keep Catholic schools in the service of social solidarity and the common good.

The ideological influence of the New Right in politics and economics was becoming evident to Church leaders and it was seen to be necessary to rearticulate and to re-emphasise Catholic social teaching about the common good and its relationship to education.

Catholic Schools and Openness

'In the certainty that the spirit is at work in every person, the Catholic school offers itself to all, non-Christians included, with all its distinctive aims and means' (p. 66).¹¹

Against widely held views that Catholic schools served Catholics only, the Congregation for Catholic Education made it explicit that Catholic schools were, (subject to available places), at the service of all who wished to enter. The concept of the ghetto school was replaced by a school at the service of the world.

The Roles of Catholic Schools in Late Modernity

This new ‘openness to the world’ was very much in the spirit of the Second Vatican Council. However, conservative Catholics feared the potential of such universal open access to dilute the Catholic ethos and culture of the schools.

This radical and explicit agenda for the transformation of Catholic schooling worldwide was offered for the consideration of Episcopal Conferences, that is, the Conference of Catholic Bishops in various parts of the world who are responsible for the administration, policy and practice of their particular educational systems:

We appeal to each Episcopal conference to consider and to develop these principles which should inspire the Catholic school and to translate them into concrete programs which will meet the real needs of the educational systems operating in their countries. (pp. 71–72)

It seems likely that the reforming principles of *The Catholic School* document may have been taken up with enthusiasm in some societies, with caution in others, and in conservative settings, virtually ignored.

At its best, the post-Vatican II version of Catholic Christian education will be characterised by its counter-cultural stance to the features of late modernity. Against a confusion of role models for the young, the schools will offer the Person of Christ; against the hegemonic consumerism of global capitalism, the schools will attempt to form a spirituality of service and of God-given vocations; against a reductionist view of knowledge as commodity and of pedagogy as technical delivery, the schools will attempt to hold to humane educational values and a dialogic learning experience for the students. The ideal post-Vatican II Catholic school will be an agency for the advancement of social justice and the common good and it will make its services available to the poor and disadvantaged and to those who are ‘far from the Faith’.¹²

That is the new vision for the role of Catholic education system arising from the deliberation of the Second Vatican Council. However, the question for large-scale comparative education research in the future is to what extent does this ideal conception of Catholic schooling exist in practice, as opposed to only in the documents and formal discourse of the Church?

To what extent have the Conferences of Bishops throughout the world taken this radical vision seriously and sought to transform their educational systems to meet the challenges of late modernity using the principles of the 1977 foundation charter?

Given that the Catholic educational system is the largest faith-based schooling system in the world with 120,000 schools serving almost 50 million students (Pittau, 2000), it is remarkable how little research and scholarly attention it has received from the various branches of Education studies, including comparative education studies.¹³

This seems to be the result of what Gallagher (1997, p. 23) has referred to as ‘secular marginalisation’ in the intellectual culture of late modernity:

especially in the academic and media worlds, a secular culture reigns with the result that religion is subtly ignored as unimportant.

As the editors of this volume assert, one of the paradoxes or contradictions of the present juncture is that education is becoming more powerfully linked to the economics of global capitalism on the one hand, but also to resurgent forms of religion on the other.¹⁴ The study of how these profound contradictions in the cultures of schooling are realised in the future becomes a major research project for comparative education. The fate of post-Vatican II Catholic schooling provides a rich field for investigation as part of that larger project.

The Educational Responses of Reformed Christianity

Of all the varieties of Reformed Christianity there is only space here to consider one of them in the context of later modernity – that of Evangelical Christianity. Karen Armstrong (2001a, p. 140) reminds us that recent events have tended to preoccupy everyone with notions of Islamic fundamentalism. This, as she points out, is a limited view because

[f]undamentalism is a global fact and has surfaced in every major faith in response to the problems of our modernity. There is fundamentalist Judaism, fundamentalist Christianity, fundamentalist Hinduism, fundamentalist Buddhism.

Of all the forms of religious fundamentalism, she argues, that of Evangelical Christianity surfaced first in the Christian world, in the USA at the beginning of the twentieth century. Although there are different realisations of Evangelical Christianity, what unites them all is an emphasis upon the literal truths of the Bible as the Word of God; a belief in the act of personal salvation as an encounter with Christ which does not depend upon the mediation of a priesthood or an institutional church; a view of secular society in late modernity as hostile to true religion and as spiritually and morally corrupt and a belief that children and young people must be educated in schooling contexts which insulate them from an externally decadent world.

Armstrong (2001b, pp. 269–270) reports that

[d]uring the 1970s (in the USA) more parents than ever before removed their children from the public schools to Christian establishments where they could be instructed in Christian values ... and where all learning was conducted within a biblical context. Between 1965 and 1983 enrolment in these evangelical schools increased six-fold and about 100,000 fundamentalist children were taught at home.¹⁵

In an era in which the Catholic schooling system sought a new stance of openness to, and of dialogue with, the external world, committing itself to working for social justice

and the common good, the Evangelical school network took up a stance of insulating its young people from the world.¹⁶ However, while the young of the community needed to be protected, it was understood to be the duty of adult Evangelists to campaign against the forces of corruption. This could be done by mobilising as a political and pressure group formation which could compel the liberal establishment to make political, educational and social concessions to the demands of Evangelical Christianity.

In the view of Evangelical Christians a new religion was in power in the USA, that of secular humanism. This false religion of late modernity had to be not only denounced but actively resisted in community, state and national politics. As a leading USA fundamentalist, Pat Robertson proclaimed, 'We have enough votes to run this country.'¹⁷

The educational consequences of fundamentalist types of Evangelical Christianity in the USA have been examined by Michael Apple (2001) in his important text, *Educating the 'Right' Way: Markets, Standards, God and Inequality*. Apple's specific focus is upon the growing power of the 'Christian Right' (evangelists) and 'the growing influence of authoritarian, populist religious conservatism in education' (p. 27). The agenda of the 'Christian Right' includes attempts to influence policy by 'bringing God back into the schools', advancing particular views on gender, sexuality and the family and by shaping ideas about what is to count as legitimate knowledge in the schools. In the absence of a national curriculum in the USA, evangelists have been successful in bringing pressure to bear upon school textbook publishers and upon state education officials. From this perspective the subjects of the curriculum and their content must be legitimated by a clear relationship with the Bible as the framework for all knowledge. In particular, Creation Science (derived from Biblical accounts) must at least be given equal time in the curriculum with Evolution Science (derived from Darwinian sources).

The agenda of conservative Evangelical Christianity is powerful in the USA because of the commitment of its activists, its large financial backing and its creative and extensive use of the mass media to propagate its messages. In noting this, Apple (2001) highlights the international mission potential of Evangelical Christian educators and preachers. Evangelicals are active in Latin America, Eastern Europe, Russia, Africa, India and many parts of Asia. If the Catholic Church responded to the challenges of early modernity by forming and deploying many religious orders with missions in education, it can be seen that Evangelical Christianity is responding to late modernity by sending out its educational and religious missionaries to all parts of the world. The power of Evangelical Christianity in education is not simply a phenomenon of the USA; it has worldwide implications for knowledge selection and pedagogical processes in many societies. The historical irony is that the Catholic Church is now witnessing a serious reduction in its religious order personnel,¹⁸ while the missionaries of Evangelism appear to be increasing rapidly.

Agendas for Comparative Education Research

This analysis has already suggested some major themes for future research.

For Catholic Christianity, the practical manifestations of a reformed post-Vatican II version of Catholic schooling requires detailed examination in various parts of the

world. A particular focus on the nature of knowledge constituted in contemporary Catholic schools is required. In what senses is this knowledge distinctively Catholic, in its content, its pedagogy and its evaluation? If the ‘teacher as witness’ is a crucial part of a Catholic educational formation, to what extent are teachers in contemporary schools fulfilling that role? Has Catholic pedagogy substantially moved from a ‘pedagogy of the catechism’ in religious teaching to a ‘pedagogy of dialogue’ about religious and spiritual matters? Has the concept of finding your God-given vocation in Catholic education weakened in late modernity as a complex result of secularisation, marketisation and the dramatic decline of vowed religious teachers as living models of vocation?

For Evangelical Christianity, detailed studies are needed of what impact it is having on curriculum selection and control in a range of countries. Is there a resurgence of Bible validated knowledge and pedagogy and what does this mean in terms of curriculum structure and process? What effects are the growing number of evangelical schools having on other schooling systems? Does Evangelical Christianity in its educational cultures have an essentially conservative and individualising effect on students, as Apple (2001) suggests, or does it provide students with a commitment to missionary work for the good of communities? In specific regions, such as Latin America, are evangelical schools beginning to displace the traditional educational cultures of Catholicism, or are these two agencies working together to strengthen Christian education in that continent?¹⁹

The injunction of Jesus Christ to his disciples to ‘go and teach all nations’ has, in the following centuries, resulted in an extensive Christian network of schools, colleges and universities in almost every country. In this chapter, because of limitations of space only the schools of the Catholic and Evangelical traditions have been discussed. If we add to these, the schools of other Christian communities, for example, Lutheran, Anglican, Orthodox, Methodist, Baptist, and other churches of Reformed Christianity, then it becomes apparent that the Christian education network is still a major force to be reckoned with. It is also a major field for future research by scholars of comparative education, and of other educational disciplines.²⁰

Reformation and Counter-Reformation in Education: An Uncertain Outcome

This chapter has used as its theoretical framework the analysis of Basil Bernstein (1996) which suggests that a major secular reformation of education is taking place in late modernity in the West.

This reformation involves the potential hegemony of a commodified concept of knowledge, a marketised form of the curriculum, a virtually secular pedagogic discourse and a conception of education as entirely concerned with the pursuit of material advantage and of social mobility. While Bernstein observed that, at the same time, ‘a revival of the sacred’ was taking place, he did not elaborate the nature of what can be called, the religious counter-reformation in education.

This chapter has tried to explore the nature of the Christian counter-reformation to these developments in education. Catholic Christian schooling, in the spirit of the

Second Vatican Council has formulated a charter and a set of principles, which if implemented, represents a powerful and distinctive oppositional agenda to that provided by economic ideologies in education across the world.²¹

Evangelical Christian schooling is involved in a more complex counter-reformation, resisting secularisation by a strong assertion of the centrality of Bible truth in educational experience and of absolute moral standards derived from this source, while at the same time appearing more nuanced in its relation to economic structures and ideologies and their impact on education.

Pope John Paul II in 1994 expressed the Catholic position on these issues in dramatic terms:

Against the spirit of the world, the Church takes up each day a struggle that is none other than the struggle for the world's soul.²²

While contemporary Catholic education is engaged in a struggle for the world's soul, it is not at all clear that it has sufficient resources to be successful in that struggle. The struggles of early modernity were undertaken by dedicated religious orders with missions in education across the world.

Contemporary struggles depend much more upon Catholic lay school leaders and teachers who may be less well resourced than their predecessors to maintain a distinctive oppositional agenda.

Evangelical Christian education has adopted a stance of counter-reformation to the influence of relativistic liberal morality in state schooling systems but in the opinion of writers such as Martin (1999) and Apple (2001) its individualistic and pragmatic stance on economic issues make it an ally of corporatism rather than a critic.

We must conclude therefore that 'the struggle for the world's soul', in educational terms, is an unequal struggle with uncertain outcomes, and as Bernstein (1996, p. 88) suggested, 'what is at stake is the very concept of education itself'.

Bernstein on Religion, Identity and Modernity

Bernstein's conclusions provide a suitable ending to the arguments of this chapter:

What appears to be happening at the end of the 20th century is a weakening of the location of the sacred. In the beginning of the century, the sacred was centrally located and informed the collective base of society through the inter-relation of state, religion and education. Today, this collective base has been considerably weakened. ... The sacred now reveals itself in dispersed sites, movements and discourses. (1996, p. 81)

However, he also noted that:

Christianity ... is a faith where faith cannot be taken for granted; it must be constantly re-won, revitalized, renewed. (1996, p. 86)

This chapter has demonstrated that the educational cultures of both Catholic Christianity and of Evangelical Christianity are attempting to defend their respective conceptions of the sacred in the conditions of late modernity. They are attempting to defend their understandings of what constitutes a valid conception of knowledge and the curriculum, a valid conception of the educational process and a distinctively Christian approach to the formation of students in education.

At the same time they are both working to revitalise and renew their educational systems in the face of the many challenges which the conditions of late modernity generate for religious believers and for faith-based education.

Notes

1. For a detailed discussion, see Bernstein (1996, pp. 75–81).
2. Reformed Christianity here refers to all those churches and religious groups which have developed since the Reformation in the sixteenth and seventeenth centuries, and which are broadly described as Protestant.
3. See Duminuco (2000), especially Appendix A: ‘The characteristics of Jesuit education’, and ‘Ignatian pedagogy: A practical approach’ (pp. 162–275). See also Appendix 2 (pp. 276–1291), ‘Ignatian pedagogy today’, which includes the statement, ‘the goal of Jesuit education is the formation of men and women for others, people of competence, conscience and compassionate commitment’ (p. 277).
4. For a detailed discussion, see Rosemary DeJulio, ‘The response of Mary Ward and Madeleine Sophie Barat to the Ratio Studiorum’, in Duminuco (2000, pp.107–126).
5. For one major study of this great educational missionary enterprise, see Murphy (2000).
6. This has been a constant theme in subsequent Vatican pronouncements on Catholic education in late modernity: ‘Many young people find themselves in a condition of radical instability. ... They live in a one-dimensional universe in which the only criterion is practical utility and the only value is economic and technological progress. ... Not a few young people ... trying to find an escape from loneliness, turn to alcohol, drugs, the erotic, the exotic. Christian education is faced with the huge challenge of helping these young people discover something of value in their lives’ (The Religious Dimension of Education in a Catholic School, 1988, pp. 8–10).
7. The spirit of Vatican II did not, unfortunately, lead to the use of gender-inclusive language in the documents of the Church.
8. This emphasis upon the importance of ‘witness’ in Catholic educational formation was strengthened further by Pope Paul VI’s much quoted (in Catholic contexts) statement: ‘Today, students do not listen seriously to teachers but to witnesses; and if they do listen to teachers, it is because they are witnesses’. (Evangelii Nuntiandi, 1975), quoted in Duminuco (2000, p. 285)
9. For further discussion of this, see Grace (2003).
10. The Catholic Bishops’ Conference of England and Wales reiterated the common good objectives of Catholic social and educational teaching in two publications in 1996 and 1997.
11. Catholic schools in ‘missionary’ contexts such as Africa, the Middle and Far East, India, etc. had always been open to those of other faiths. This radical development in 1977 extended this openness to all contexts internationally.
12. For some research studies which have attempted to assess the impact of Vatican II reforms upon the practice of Catholic schooling, see Arthur (1995), Bryk et al. (1993), Flynn (1993), Grace (2002), Greeley (1998), McLaughlin et al. (1996), O’Keefe (2000), Sullivan (2000) and Youniss et al. (2000 a,b).
13. Some attempt to remedy this situation will be made in a forthcoming publication, International Handbook of Catholic Education, edited by Gerald Grace and Joseph O’Keefe, S.J., to be published in 2007.
14. This was also recognised by Bernstein (1996, p. 80): ‘We have produced for the first time a virtually secular pedagogic discourse and culture, and at the same time, a revival of the sacred.’

15. Walford (2001) has examined the development of Christian Evangelical schools in England and the Netherlands.
16. It must be noted however that pre-Vatican II Catholic schools were also insulated from the external world which was regarded as potentially corrupting for the Faith.
17. Quoted in Armstrong (2001b, p. 267).
18. The seriousness of the situation was recognised by the Sacred Congregation for Catholic Education publication, *Lay Catholics in Schools: Witnesses to Faith* (1982). In this document the hope was expressed that the charisma and sense of vocation of the declining religious teaching orders would be reconstituted in their lay successors.
19. For one discussion of the impact of Protestant evangelisation in Latin America, see Cook (1994). See especially Chapter 5 (Berg & Pretiz) and Chapter 20 (Bonino).
20. For an attempt to encourage such research, see Grace (2004).
21. Casanova (1994, p. 5) argues, with special reference to Catholicism, that 'religious traditions throughout the world are refusing to accept the marginal and privatised role which theories of modernity ... had reserved for them. Social movements have appeared ... challenging in the name of religion ... the state and the market economy'.
22. Quoted in Grace (2002, p. 21)

TOWARDS A COMPARATIVE PEDAGOGY¹

Robin Alexander

The Neglect of Pedagogy in Comparative Enquiry

Pedagogy is the most startlingly prominent of the educational themes which British comparativists have ignored. In the special millennial issue of the leading UK journal *Comparative Education*, Angela Little recorded that just 6.1% of the journal's articles between 1977 and 1998 dealt with 'curricular content and the learner's experience' as compared with nearly 31% on themes such as educational reform and development (Little, 2000, p. 283); Cowen asserted that 'we are nowhere near coming fully to grips with the themes of curriculum, pedagogic styles and evaluation as powerful message systems which form identities in specific educational sites' (Cowen, 2000, p. 340); and Broadfoot argued that future comparative studies of education should place much greater emphasis 'on the process of learning itself rather than, as at present, on the organisation and provision of education' (Broadfoot, 2000, p. 368).

If the omission is so obvious, one might reasonably enquire why comparativists have not remedied it. There may be a simple practical explanation. Policy analysis, especially when it is grounded in documentation rather than fieldwork, is a more manageable option than classroom research. Cheaper, speedier and more comfortable too: who would exchange their library or internet connection for time-consuming and occasionally hair-raising journeys encumbered by video and audio recorders, cameras, tripods, observation schedules, interview schedules, clothing, food and all the other necessary apparatus of 'thick description' – not to mention the complex negotiations which nowadays are required before one can observe teachers or talk to children?

As a less uncharitable possibility, and echoing Brian Simon's 'Why no pedagogy in England?' (Simon, 1981), we might suggest that a country without an indigenous 'science of teaching' is hardly likely to nurture pedagogical comparison: cherry-picking and policy borrowing maybe, but not serious comparative enquiry (Alexander, 1996).

Or perhaps pedagogy is one of those aspects of comparative education which demands expertise over and above knowledge of the countries compared, their cultures, systems and policies. I rather think it is, especially given the condition which Simon identified. Michael Crossley (2000) argues:

If the well documented pitfalls of comparative education are not to be re-encountered, it is important that those new to such research engage with the

literatures that are central to the field. Similarly, it is important for those who see themselves as comparativists to embrace the opportunities presented by such a widening of research networks and discourses. (p. 324)

A certain imbalance in the force of these two imperatives is detectable here: non-comparativists must ‘engage with the literature’ (presumably because their ignorance is greater), but comparativists need only to ‘embrace opportunities’. There may well be evidence of ill-judged comparison among the ‘new’ educational comparers, but we can also find examples of superficial or even ill-conceived analyses of particular educational phenomena in the mainstream comparative literature. Unless one is content to confine oneself to that superficial A vs B juxtaposing of national educational systems which used to be the staple diet of university comparative education courses but, mercifully, is now much less common, then meaningful educational comparison is never less than a magnificent challenge, for it requires engagement with several distinct literatures and modes of analysis simultaneously. One can hardly study comparative law or literature without knowing at least as much about law or literature as about the countries and cultures involved and the business of making comparisons; the same goes for comparative education.

This is why this chapter’s title refers to ‘comparative pedagogy’.² Pedagogy is a complex field of practice, theory and research in its own right. The challenge of comparative pedagogy is to marry the study of education elsewhere with the study of teaching and learning in a way which respects both of these fields of enquiry yet also creates something which is more than the sum of their parts.

New Territories, but Old Maps

Little’s framework for classifying journal articles on comparative education (Little, 2000) differentiated *context* (the country or countries studied), *content* (using the 1978 thematic classification reproduced inside the journal’s back cover, and *comparison* (the number of countries compared). Trying to place my *Culture and Pedagogy* (Alexander, 2001) within this framework underlines pedagogy’s marginal status in mainstream comparative discourse. This study used documentary, interview, observational, video and photographic data collected at the levels of system, school and classroom between 1994 and 1998. The study’s ‘context’ was England, France, India, Russia and the United States. So far so good, even though five-country studies are relatively unusual. Edmund King’s seven-nation study remains the classic example of this genre (King, 1979). Its ‘content’ straddled at least 6 of Little’s 13 themes without sitting comfortably within any of them, and the educational phase with which it dealt – primary education – did not appear at all in that framework (nor, strikingly, did the terms ‘teaching’ or ‘learning’, let alone ‘culture’ or ‘pedagogy’). Its ‘comparison’ was across five countries (a rarity) and included both North and South (a rarity overall, and a novelty in Little’s five-country category).

Apart from the fact that, as already noted, pedagogy is a neglected field in comparative enquiry, there is a further reason why the content of this research maps so

imperfectly onto Little's framework: the framework does not accommodate studies which cross one important boundary hitherto unmentioned, that between the macro and the micro. *Culture and Pedagogy* – as the title suggests – illustrates Sadler's hoary maxim about the inseparability of the worlds inside and outside the school (Sadler, 1900), yet Little's framework seems to imply that comparative studies must be either national *or* local, about policy *or* practice, the system *or* the classroom, rather than about their interaction. In this respect, comparativists may be somewhat behind the larger social science game, in which the relationship between social structure, culture and human agency has been 'at the heart of sociological theorising' for well over a century (Archer, 2000, p. 1).

Thus, pedagogy does not begin and end in the classroom. It is comprehended only once one locates practice within the concentric circles of local and national, and of classroom, school, system and state, and only if one steers constantly back and forth between these, exploring the way that what teachers and students do in classrooms reflects the values of the wider society. That was one of the challenges which the *Five Cultures* research sought to address.

Another challenge for a comparative pedagogy is to engage with the interface between present and past, to enact the principle that if one is to understand anything about education elsewhere one's perspective should be powerfully informed by history. So while the comparative journey in *Culture and Pedagogy* culminates in a detailed examination of teacher–pupil discourse – for language is at once the most powerful tool of human learning and the quintessential expression of culture and identity – it starts with accounts of the historical roots and developments of primary education in each of the five countries, paying particular attention to the emergence of those core and abiding values, traditions and habits which shape, enable and constrain pedagogical development.

Defining Pedagogy

So far, a definition of pedagogy has been inferred. It is time to be more explicit. One of the values of comparativism is that it alerts one to the way that the apparently bedrock terms in a particular discourse are nothing of the sort.

Thus it may well matter, in the context of the strong investment in citizenship which is part of French public education, that *éduquer* means to bring up as well as formally to educate and that *bien éduqué* means well brought up or well-mannered rather than well-schooled ('educate' in English has both senses too, but the latter now predominates); or that the root of the Russian word for education, *obrazovanie*, means 'form' or 'image' rather than, as in our Latinate version, a 'leading out'; or that *obrazovanie* is inseparable from *vospitanie*, an idea which has no equivalent in English because it combines personal development, private and public morality, and civic commitment, while in England these tend to be treated as separate and even conflicting domains; or that *obuchenie*, which is usually translated as teacher-led 'instruction,' signals learning as well as teaching. It is almost certainly significant that in English (and American) education 'development' is viewed as a physiological and psychological process

which takes place independently of formal schooling whereas Russian teachers define 'development' transitively, as a task which requires their active intervention: in the one context development is 'natural' while in the other it is more akin to acculturation. Similarly, in the Anglo-American tradition the most able child is defined as the one with the greatest potential, while in Russia's Soviet pedagogical legacy it is the least able, because he/she has furthest to travel towards goals which are held to be common for all children (Muckle, 1988; Alexander, 2001, pp. 368–370).

Such terms hint at more than the comparativist's need to be sensitive to the problems of language and translation. They also subtly align the educational agenda along culturally distinctive lines even before one starts investigating the detail of policy and practice. In the cases exemplified above, both *l'éducation* and *vospitanie* inject suggestions of public morality and the common good into the discourse in ways which subliminally influence the recurring discussions about school goals and curricula in France and Russia; while the Russian notions of 'potential' and 'development' each imply – and indeed impose – strong teacher agency and responsibility in a way which their more passive and individualistic English and American connotations do not. The notion of teacher as 'facilitator', which is so central to the Anglo-Saxon progressive tradition, would make little headway in those continental European countries in which teacher intervention and instruction are seen as essential to school learning.

The consciousness intimated here also implies a model of pedagogy, and a course for comparative pedagogical analysis, which are as far removed as they can be from the polarising of 'teacher-centred' (or 'subject-centred') and 'child-centred' teaching which too often remains the stock-in-trade of such accounts of pedagogy as are available in the comparative literature (Alexander, 2006). Mainstream pedagogical research abandoned this dichotomy years ago; mainstream comparative research should do likewise. Perhaps the most damaging residue of this sort of thinking can still be found in the reports of some development education consultants, who happily commend Western 'child-centred' pedagogy to non-Western governments without regard for local cultural and educational circumstances, or for recent advances in the psychology of learning and teaching, or for the findings of pedagogical research on the decidedly questionable record of child-centred teaching in Western classrooms.

That touch of waspishness apart, we would do well to be no less cautious about another boundary problem here. In the literature on culturally located views and models of teaching, generalised 'Asian', 'Pacific Rim', 'Western', 'non-Western' and 'European' 'models' of teaching and learning feature prominently and confidently (Reynolds & Farrell, 1996; Stevenson & Stigler, 1992; Clarke, 2001). If we recognise that the geographical and cultural coverage of 'Asian' is too broad to have descriptive validity for the analysis of teaching, we should be no less aware of the hegemonic overtones of 'Western'. Does 'Western' encompass South as well as North America? Does it include some European countries while excluding others? With its implied validation of a particular world view, tellingly captured since 2003 in the Old/New Europe name-calling of the Bush administration, 'Western' may well exacerbate rather than supplant the pedagogy of opposition, fuelling a self-righteous occidentalism every bit as pernicious as Said's orientalism (Said, 1979).

As our core educational concept, ‘pedagogy’ lies linguistically and culturally on sands at least as treacherous as these. In the Anglo-American tradition, pedagogy is subsidiary to curriculum, sometimes inferring little more than ‘teaching method’. ‘Curriculum’ itself has both a broad sense (everything that a school does) and a narrow one (what is formally required to be taught) which comes closer to continental European ‘didactics’ without capturing the sense in *la didactique* or *die Didaktik* of a quasi-science comprising subject knowledge and the principles by which it is imparted. Curriculum is more prominent in educational discourse in systems where it is contested, less where it is imposed or accepted as a given. In the central European tradition, it is the other way round: pedagogy moves centre stage and frames everything else, including curriculum – in so far as *that* word is used – and didactics (Alexander, 2001, pp. 540–556; Moon, 1998).

Because the range of meanings attaching to pedagogy varies so much in English – quite apart from differences between English and other languages – we have to be stipulative, and in a way which allows us to use the term for comparative analysis. I prefer to eschew the greater ambiguities of ‘curriculum’ and the resulting tendency to downgrade pedagogy, and use the latter term to encompass the larger field. I distinguish pedagogy as *discourse* from teaching as *act*, yet I make them inseparable. Pedagogy, then, encompasses both the act of teaching and its contingent theories and debates. Pedagogy is the discourse with which one needs to engage in order both to teach intelligently and make sense of teaching – for discourse and act are interdependent, and there can be no teaching without pedagogy or pedagogy without teaching.

A *comparative* pedagogy takes this discourse not one stage but several stages further. Pedagogy relates the act of teaching to the ideas which inform and explain it. Comparative pedagogy identifies, explores and explains similarities and differences in pedagogy, as concept, discourse and practice, across designated units of comparison such as nation states. It thereby exploits opportunities which only proper comparison can provide: teasing out what is universal in pedagogy from what is culturally or geographically specific, informing the development of pedagogic theory, and extending the vocabulary and repertoire of pedagogic practice.

Conditions for a Comparative Pedagogy

We can now propose three conditions for a comparative pedagogy. First, it should incorporate a defensible rationale and methodology for comparing across sites, cultures, nations and/or regions. Second, it should combine procedures for studying teaching empirically with ways of accessing the values, ideas and debates which inform, shape and explain it. Third, because these values, ideas and debates are part of a wider educational discourse and – typically – are located in the context of public national education systems as well as schools and classrooms, a comparative pedagogy should access these different levels, contexts and constituencies and examine how they relate to each other and inform the discourse of pedagogy and the act of teaching.

The first condition applies to all comparative studies so I need say no more about it: it will no doubt feature in other chapters. About the second and third conditions, however, I need to say rather more.

Frameworks for a Comparative Pedagogy

If pedagogy is shaped by national culture and history, and by the migration of ideas and practices across national borders, as well as by more immediate practical exigencies and constraints such as policy and resources, is it possible to postulate a model of pedagogy, and a framework for studying it, which both accommodates its many forms and variations and rises above the constraints of value and circumstance? Can we devise an analytical model which will serve the needs of the empirical researcher in any context? This was the challenge we had to take up in the *Culture and Pedagogy* project, for we needed to make sense of disparate classroom data in a way which showed no obvious bias towards particular, culturally specific accounts of learning and teaching.

The resulting framework has three parts. The first deals with the observable act of teaching; the second with the ideas which inform it; the third with the macro–micro relationship which links classroom transaction to national policy via the curriculum.

We start, though, with a definition:

Pedagogy is the observable act of teaching together with its attendant discourse of educational theories, values, evidence and justifications. It is what one needs to know, and the skills one needs to command, in order to make and justify the many different kinds of decisions of which teaching is constituted.

With this our colours are nailed firmly to the international mast. In Britain, if the word is used at all, ‘pedagogy’ signals merely the teaching act, and the act’s informing ideas stand in an, at best, uneasy relationship to it, as so much ‘theory’ to be ‘applied’ (or not). But, unfortunately for the theory/practice dualists, the theory is there whether they like it or not, unless of course they are prepared to claim that teaching is a mindless activity. The task is to explicate the theory, which in teaching we know to be a complex amalgam of sedimented experience, personal values and beliefs, reinterpretations of published research, and policy more or less dutifully enacted.

Pedagogy as Practice

Many years ago the anthropologist Edmund Leach (1964) argued that the more complex the model, the less likely it is to be useful. With that warning in mind, we start by reducing teaching to its barest essentials:

Teaching, in any setting, is the act of using method x to enable students to learn y .

In so skeletal a form the proposition is difficult to contest, and if this is so we extract from it two no less basic questions to steer empirical enquiry:

- What are students expected to learn?
- What method does the teacher use to ensure that they do so?

‘Method’ needs to be unpacked if it is to be useful as an analytical category which can cross the boundaries of space and time. Any teaching method combines *tasks*, *activities*, *interactions* and *judgements*. Their function is represented by four further questions:

- In a given teaching session or unit what *learning tasks* do students encounter?
- What *activities* do they undertake in order to address these learning tasks?
- Through what *interactions* does the teacher present, organise and sustain the learning tasks and activities?
- By what means, and on the basis of what criteria, does the teacher reach *judgements* about the nature and level of the tasks and activities which each student shall undertake (*differentiation*), and the kinds of learning which students achieve (*assessment*)?

Task, activity, interaction and judgement are the building blocks of teaching. However, as they stand they lack the wherewithal for coherence and meaning. To our first proposition, therefore, we must add a second. This unpacks ‘in any setting’, the remaining phrase in our first proposition:

Teaching has structure and form; it is situated in, and governed by, space, time and patterns of pupil organisation; and it is undertaken for a purpose.

Structure and form in teaching are most clearly and distinctively manifested in the *lesson*. Lessons and their constituent teaching acts are framed and governed by *time*, by *space* (the way the classroom is disposed, organised and resourced) and by the chosen forms of *student organisation* (whole class, small group or individual).

But teaching is framed conceptually and ethically, as well as temporally and spatially. A lesson is part of a larger *curriculum* embodying educational purposes and values, and reflecting assumptions about what knowledge and understanding are of most worth to the individual and to society. This is part of the force of ‘teaching ... is undertaken for a purpose’. One element remains. Teaching is not a series of random encounters. Together, students and teachers create and are defined by a micro culture. They develop procedures for regulating the complex dynamics of student–teacher and student–student relationships, the equivalent of law, custom, convention and public morality in civil society. This element we define as *routine, rule and ritual*.

The complete teaching framework (discussed in greater detail in Alexander, 2001, pp. 320–325) is shown in Figure 1. The elements are grouped under the headings of *frame, form* and *act*. The core acts of teaching (task, activity, interaction and judgement) are framed by classroom organisation (‘space’), pupil organisation, time and curriculum, and by classroom routines, rules and rituals. They are given form in the lesson or teaching session.

Choices then have to be made about how one analyses each of the elements. These dictate further questions about analytical categories, research methods and technologies which for reasons of space cannot be addressed here. Suffice it to say that in the *Culture and Pedagogy* research each element above was broken down into several analytical sub-units, the main research tools were observation, video and interview,

A generic model of teaching

Frame	Form	Act
Space		Task
Pupil organisation		Activity
Time	Lesson	
Curriculum		Interaction
Routine, rule and ritual		Judgement

Figure 1. A generic model of teaching

and the core data comprised field notes, interview transcripts, lesson transcripts, photographs, teaching documents and some 130 hours of videotape. However, this information is relevant here only in so far as it demonstrates that the framework actually works. The comparative analysis of teaching in *Culture and Pedagogy* starts with the basic disposition of the framing and regulatory elements of curriculum, space, pupil organisation, time and routine/rule/ritual, and works through each of the others before finishing with a sustained analysis of patterns of classroom interaction and the dynamics and content of teacher–pupil discourse. The same framework could be used to inform a rather different research methodology. The point at issue here is conceptual rather than technical: it concerns not the relative advantages of, say, systematic observation using pre-coded interaction categories to produce quantifiable data and the use of transcripts to sustain close-grained qualitative analysis of discourse, but the viability of this as a framework for researching teaching in any context and by any means.

Pedagogy as Ideas

The second part of our framework for the comparative study of pedagogy attends to the ideas, values and beliefs by which the act of teaching is informed and justified. These can be grouped into three domains, as shown in Figure 2. Private assumptions and beliefs about teaching are not distinguished here from public accounts of the kind which teachers meet while being trained, for all are a kind of theory. The object here is not to differentiate theory which is public or private, espoused or in use (Argyris & Schön, 1974) but the themes with which such theories deal. Pedagogy has at its core ideas about learners, learning and teaching, and these are shaped and modified by context, policy and culture. Where the first domain *enables* teaching and the second *formalises* and *legitimises* it by reference to policy and infrastructure, the third domain *locates* it – and children themselves – in time, place and the social world, and anchors it firmly to the questions of human identity and social purpose without which teaching makes little sense. Such ideas mark the transition from teaching to education.

Macro and Micro

The element in the framework in Figure 1 which most explicitly links macro with micro, in the narrower sense of policy and school rather than culture and professional

Pedagogy as ideas (theories, values, evidence and justifications)

Classroom level: ideas which enable teaching

- *Students* characteristics, development, motivation, needs, differences.
- *Learning* nature, facilitation, achievement and assessment.
- *Teaching* nature, scope, planning, execution and evaluation.
- *Curriculum* ways of knowing, doing, creating, investigating and making sense.

System / policy level: ideas which formalise and legitimate teaching

- *School* e.g. infrastructure, staffing, training.
- *Curriculum* e.g. aims, content
- *Assessment* e.g. formal tests, qualifications, entry requirements
- *Other policies* e.g. teacher recruitment and training, equity and inclusion

Cultural / societal level: ideas which locate teaching

- *Culture* the collective ideas, values, customs and relationships which inform and shape a society's view of itself, of the world and of education.
- *Self* what it is to be a person; how identity is acquired.

Figure 2. Pedagogy as ideas (theories, values, evidence and justifications)

agency, is the curriculum. In most systems curriculum is centrally prescribed, either at national level or, as in a federal and decentralised system like the United States, at the levels of state and school district. In few if any public education systems is control of the curriculum vested solely in the school.

In fact, the curriculum is probably best viewed as a series of *translations*, *transpositions* and *transformations* from its initial status as a set of formal requirements. At the beginning of this process of metamorphosis is the national or state curriculum. At its end is the array of understandings in respect of each specified curriculum goal and domain which the student acquires as a result of his or her classroom activities and encounters. In between is a succession of shifts, sometimes bold, sometimes slight, as curriculum moves from specification to transaction, and as teachers and students interpret, modify and add to the meanings which it embodies. Sometimes the change may be slight, as when a school takes a required syllabus or programme of study and maps it onto the timetable. This we might call a *translation*. Then a school or teacher may adjust the nomenclature and move parts of one curriculum domain into another to effect a *transposition*, which then leads to a sequence of lesson plans. But the real change, the *transformation*, comes when the curriculum passes from document into action and is broken down into learning tasks and activities, and expressed and negotiated as teacher–student interactions and transactions.

However faithful to government, state or school requirements a teacher remains, teaching is always an act of curriculum transformation. In this sense, therefore, curriculum is a ‘framing’ component of the act of teaching, as suggested by Figure 1, only before it is transformed into task, activity, interaction, discourse and outcome. From that point on it becomes inseparable from each of these. In the classroom, curriculum *is* task, activity, interaction and discourse, and they are curriculum.

Curriculum metamorphosis

<i>Specification</i>	National, state or local curriculum	1	
<i>Translation</i>	School curriculum	2	Frame
<i>Transposition</i>	Class curriculum and timetable	3	
	Lesson plan	4	
<i>Transformation</i>	Lesson	5	Form
	Task	6	
	Activity	7	Act
	Interaction	8	
	Assessment	9	

Figure 3. Curriculum metamorphosis

Figure 3 schematises this process, and ties it into the families of ‘frame’, ‘form’ and ‘act’ from the model of teaching in Figure 1. Together with Figure 2, the frameworks provide a basis for constructing a reasonably comprehensive empirical account of pedagogy at the level of action, and for engaging with the attendant discourses.

Of course, the macro–micro relationship is about much more than state–school curriculum transmission or transformation. For a start, the process is complicated by the existence of more levels than bipolar formulations like ‘macro–micro’ or ‘centralisation–decentralisation’ allow. Regional and local tiers of government have their own designated powers, or strive to compensate for their lack of these by exploiting their closeness to the action, and local agency manifests itself in many other guises, both formal and informal, beyond the governmental and administrative. In the *Five Cultures* data, the importance of these intermediate levels and agencies provided a corrective to Margaret Archer’s classic account of the development of state education systems (Archer, 1979). A proper explanatory account of pedagogical discourse needs to engage with this more complex arena of control and action if it is to move out of the straitjacket of linear models of teaching as policy-enactment and education as unmodified cultural transmission. Here the work of Giroux (1983) and Apple (1995) provides the necessary moderation to the stricter reproductionist line taken by Bowles and Gintis (1976) or Bourdieu and Passeron (1990).

Such an account also needs to treat the somewhat mechanistic concept of ‘levels’ itself with a certain caution, for once we view pedagogic practice through the profoundly important lens of values we find – as Archer shows in her later work (1989) – that the relationship between structure, culture and (pedagogic) agency is more complex still.

Values

Values, then, spill out untidily at every point in the analysis of pedagogy, and it is one of the abiding weaknesses of much mainstream research on teaching, including the rare accounts that appear in the comparative education literature, that it tends to play down their significance in shaping and explaining observable practice. Latterly,

the idea of 'value-free' teaching has been given a powerful boost by the endorsement by several Anglophone governments of school effectiveness research (which reduces teaching to technique and culture to one not particularly important 'factor' among many) and by its adoption, across the full spectrum of public policy, of the crudely utilitarian criterion, 'what works'. Teaching is an intentional and moral activity: it is undertaken for a purpose and is validated by reference to educational goals and social principles as well as to operational efficacy. In any culture it requires attention to a range of considerations and imperatives: pragmatic, certainly, but also empirical, ethical and conceptual (Alexander, 1997, pp. 267–287).

Clearly, a value-sanitised pedagogy is not possible. It makes as little sense as a culture-free comparative education. Yet values can all too easily be neglected, and the problem may reflect the accident of technique rather than conscious design. Thus, an account of classroom interaction in Kenyan primary schools (Ackers & Hardman, 2001) uses Sinclair and Coulthard's (1992) discourse analysis system, which reduces spoken discourse to a hierarchy of ranks, transactions, moves and acts with little regard to its meaning and none to its sociolinguistic context. The Kenyan study is illuminating, yet if the chosen procedure is problematic in linguistic terms, it may be doubly so in a comparative study of teachers in one country undertaken by researchers from another.

In the rather different setting of a seminar on the American East Coast, a participant viewed one of the *Culture and Pedagogy* lesson videotapes³ and condemned the featured American teacher for 'wasting time' when she negotiated with her students rather than directed them. The teacher concerned was highly experienced, and perfectly capable of delivering a traditional lesson and imposing her will upon the children. But she chose not to, because her educational goals included the development of personal autonomy and choice and she believed it necessary for children to learn, the hard way if necessary, how to master time rather than have it master them. (For time, as we found in this research, is a value in education as well as a measure of it, and it was viewed and used in very different ways in the five countries). This teacher was expressing in her practice not only her private values, but also those embodied in the policies of her school, school district and state. These values should have been the seminar participant's first port of call.

The issue here was not one of simple professional competence but of how, in a culture which stands so overtly for individual freedom of action, the diverging individualities of 25 students in one classroom can be reconciled with ostensibly common learning goals. For this example was but the tip of a values iceberg, a continuum in which the observed American pedagogy stood at the opposite extreme to what we observed in Russia and India. On the one hand, confusion, contradiction and inconsistency in values; on the other, clarity, coherence and consistency (inside the classroom at least – what we saw on the streets of post-Soviet Russia told a different story, but then our teacher respondents were very clear that their task was to hold the line against the rising tide of *anomie*). It is this inherent cultural dissonance, as much as simple executive competence, which explains many of the startling contrasts in the practice, and in the apparent efficiency of the practice, with which such values were associated.

This example, too, may help us with our earlier asides about Sadler and cultural borrowing and lending. For perhaps it is the degree of compatibility at the level of

values which sets the limits to what can be successfully transferred at the level of practice. A pedagogy predicated on teacher authority, induction into subject disciplines, general culture and citizenship will sit uneasily, at best, with one which celebrates classroom democracy, personal knowledge, cultural pluralism and antipathy to the apparatus of the state, and vice versa. This simple proposition, which can readily be tested in practice, eludes the policy borrowers, who presume that 'what works' in one country will work in another. Thus until Russian education succumbed to resource starvation following the economic collapse of the mid-1990s, Russian children continued for a while to outperform those of the United States in mathematics and science, despite the massive disparity in funding between the two countries' education systems (Ruddock, 2000; World Bank, 2000). Yet the World Bank and OECD dismissed Russian teaching as 'authoritarian' and 'old-fashioned' and pressed for a more 'democratic' and 'student-centred' pedagogy (World Bank, 1996; OECD, 1998).

Temporal and Spatial Continuities

So the explication of values is a *sine qua non* for a comparative pedagogy. Such analysis can reveal continuities as well as differences. Thus, although an offspring of revolution, French public education retains features which recall its pre-revolutionary and ecclesiastical origins (Sharpe, 1997), and the conjunction of institutional secularism and individual liberty is not without its tensions, as is shown by the recurrent crises over *l'affaire du foulard* (the scarf in this case is the Muslim *hijab*, occasionally the *chador*). The more obvious Soviet trappings of Russian education have been shed, but the abiding commitment to *vospitanie*, and the emphasis in schools and classrooms on collective action and responsibility allied to unambiguous teacher authority, not to mention the methods of teaching, show the more clearly that the continuities here are Tsarist as well as Soviet. The continuities in India reach back even further, and we found at least four traditions – two of them indigenous (Brahmanic and post-Independence) and two imposed (colonialist and missionary) combining to shape contemporary primary practice in that vast and complex country (Kumar, 1991).

In England, the twin legacies of elementary school minimalism and progressive idealism offset government attempts at root-and-branch modernisation. The one still shapes school structures and curriculum priorities (and government is as much in its thrall as are teachers), while the other continues to influence professional consciousness and classroom practice. Indeed, in seeking to win over a disgruntled teaching force the UK government's post-2003 Primary National Strategy sought to soften its statist image by appealing directly to the progressivist virtues of 'enjoyment', 'creativity' and 'flexibility', complete with large print and pictures of smiling children (DfES, 2003; Alexander, 2004). Some saw through this ploy; many others did not.

Jerome Bruner reminds us, too, that in our pedagogical theorising,

we are still drawing rich sustenance from our more distant, pre-positivist past. Chomsky acknowledges his debt to Descartes, Piaget is inconceivable without

Kant, Vygotsky without Hegel and Marx, and 'learning theory' was constructed on foundations laid by John Locke. (Bruner, 1990, pp. x–xi)

This kind of intellectual genealogy was most strongly visible in Russian pedagogy, partly because of the overall consistency of practice and partly because those whom we interviewed were themselves fully aware of the roots of their thinking; for this is a pedagogy in which – unlike in England – education theory and history are held to be important. Thus, if Russian pedagogy owes much, via Vygotsky and his disciples, to Hegel and Marx, it owes no less to a tradition of pedagogic rationality which reaches back via Ushinsky to Comenius and Francis Bacon. And it is a familiar truth that Lenin and Stalin built directly on the Tsarist legacy of political autocracy, nationalism and religious orthodoxy, thus securing fundamental continuities amidst the chaos (Lloyd, 1998; Hobsbawm, 1995). In interview, one of our Russian teachers spoke readily about the influence on her pedagogy of Vygotsky (1896–1934), Ushinsky (1824–1871) and Kamenski (Comenius, 1592–1670), not to mention a host of post-Vygotskians such as Davydov, Elkonin and Leont'ev, and academics at the local pedagogical university. How many British teachers have this depth of historical awareness – let alone such interest in what, beyond personal values, public policies and classroom circumstances, might inform their teaching?

Temporal continuities such as these shape contemporary educational practice and set limits to the character and speed of its further development, notwithstanding the ahistorical zeal of government modernisers. The spatial continuities, casually crossing national borders without so much as a nod to Sadler, are detectable in a study involving several countries to an extent that is not possible, or plausible, in a study involving just two. These continuities place within our reach an important prize, that of differentiating the universal in pedagogy from the culturally specific.

Versions of Teaching

Again, it is not possible to list all the cross-cultural resonances we encountered in the *Five Cultures* research. However, overarching these were six versions of teaching and three primordial values which we briefly summarise.

1. *Teaching as transmission* sees education primarily as a process of instructing children to absorb, replicate and apply basic information and skills.
2. *Teaching as initiation* sees education as the means of providing access to, and passing on from one generation to the next, the culture's stock of high-status knowledge, for example, in literature, the arts, humanities and the sciences.
3. *Teaching as negotiation* reflects the Deweyan idea that teachers and students jointly create knowledge and understanding in an ostensibly democratic learning community, rather than relate to one another as authoritative source of knowledge and its passive recipient.
4. *Teaching as facilitation* guides the teacher by principles which are developmental (and, more specifically, Piagetian) rather than cultural or epistemological.

- The teacher respects and nurtures individual differences, and waits until children are ready to move on instead of pressing them to do so.
5. *Teaching as acceleration*, in contrast, implements the Vygotskian principle that education is planned and guided acculturation rather than facilitated 'natural' development, and indeed that the teacher seeks to outpace development rather than follow it.
 6. *Teaching as technique*, finally, is relatively neutral in its stance on society, knowledge and the child. Here the important issue is the efficiency of teaching regardless of the context of values, and to that end imperatives like structure, economic use of time and space, carefully graduated tasks, regular assessment and clear feedback are more pressing than ideas such as democracy, autonomy, development or the disciplines.

The first is ubiquitous, but in the *Five Cultures* data it was most prominent in the rote learning and recitation teaching of mainstream Indian pedagogy. French classrooms provided the archetype of the second, but it also surfaced in Russia and India, and – though often under professional protest at the primary stage – in England and the United States (its more secure pedigree in English education perhaps lies with Matthew Arnold and the independent and grammar school traditions). Teachers in the United States frequently argued and sought to enact both the third and the fourth versions of teaching, often with explicit obeisance to John Dewey and Jean Piaget. Those in England, subject to the pressures of the government's literacy and numeracy strategies, still made much of developmental readiness and facilitation though rather less of democracy. Drawing explicitly on Vygotsky's maxim that 'the only good teaching is that which outpaces development', our Russian teachers illustrated the pedagogy of intervention and acceleration (5) which was diametrically opposed to facilitation and developmental readiness. At the same time, they, like teachers across a wide swathe of continental Europe, drew on the older Comenian tradition (6) of highly structured lessons, whole class teaching, the breaking down of learning tasks into small graduated steps, and the maintenance of economy in organisation, action and the use of time and space (Comenius, 1657, pp. 312–334).

The trajectory of recent pedagogical reform shows interesting permutations on these. Thus, under the Government of India District Primary Education Programme, Indian teachers were urged to become more democratic (3) and developmental (4) (Government of India, 1998). The language of developmentalism and facilitation also found its way into policy documents in France and Russia (Ministère de l'Éducation Nationale, 1998; Ministry of General and Professional Education, 2000). In contrast, English teachers were being urged to emulate the continental tradition represented by (6), notably through the espousal of 'interactive whole class teaching' in the UK government's literacy and numeracy strategies (DfEE, 1998, 1999). These are deliberate acts of pedagogical importation. How far the alien can accommodate to the indigenous remains to be seen.

A distinctly continental European tradition has already been inferred. The *Five Cultures* data enables the idea of broad pedagogical traditions which cut across national

boundaries to be consolidated. In this research, the great cultural divide was the English Channel, not the Atlantic. There was a discernible Anglo-American nexus of pedagogical values and practices, just as there was a discernible continental European one, with Russia at one highly formalised extreme and France – more eclectic and less ritualised, though still firmly grounded in structure and *les disciplines* – at the other. India's pedagogy was both Asian and European, as its history would suggest.

Primordial Values

Teachers in the five-nation study also articulated, enacted or steered an uncertain path between three versions of human relations: *individualism*, *community* and *collectivism*.

- *Individualism* puts self above others and personal rights before collective responsibilities. It emphasises unconstrained freedom of action and thought.
- *Community* centres on human interdependence, caring for others, sharing and collaborating.
- *Collectivism* also emphasises human interdependence, but only in so far as it serves the larger needs of society, or the state (the two are not identical), as a whole.

Within the observed classrooms, a commitment to *individualism* was manifested in intellectual or social differentiation, divergent rather than uniform learning outcomes, and a view of knowledge as personal and unique rather than imposed from above in the form of disciplines or subjects. *Community* was reflected in collaborative learning tasks, often in small groups, in 'caring and sharing' rather than competing, and in an emphasis on the affective rather than the cognitive. *Collectivism* was reflected in common knowledge, common ideals, a single curriculum for all, national culture rather than pluralism and multiculturalism, and on learning together rather than in isolation or in small groups.

These values were pervasive at national, school and classroom levels. We are familiar with the contrast between the supposedly egocentric cultures of the West, with the United States as the gas-guzzling arch villain, and the supposedly holistic, sociocentric cultures of south and east Asia. Though there is evidence to support this opposition (Shweder, 1991) it is all too easy to demonise one pole and romanticise – or orientalise – the other. But I think when it comes to pedagogy the tripartite distinction holds up, and it seems by no means accidental that so much discussion of teaching methods should have centred on the relative merits of whole-class teaching, group and individual work.

In France this debate can be traced back to arguments at the start of the nineteenth century about the relative merits of *l'enseignement simultané*, *l'enseignement mutuel* and *l'enseignement individuel* (Reboul-Scherrer, 1989). As a post-revolutionary instrument for fostering civic commitment and national identity as well as literacy, *l'enseignement simultané* won. Only now, reflecting decentralisation and the rising tide of individualism, has its hegemony begun to be questioned.

Individualism, community and collectivism are – as child, group and class – the organisational nodes of pedagogy because they are the social nodes of human relations. However, divorcing teaching as technique from the discourse of pedagogy as we so often do, we may have failed to understand that such core values and value-dissonances pervade social relations inside the classroom no less than outside it; and hence we may have failed to understand why it is that undifferentiated learning, whole-class teaching and the principle of bringing the whole class along together ‘fit’ more successfully in many other cultures than they do in England or the United States, and why teachers in these two countries regard this pedagogical formula with such suspicion. For individualism and collectivism arise inside the classroom not as a clinical choice between alternative teaching strategies so much as a value-dilemma which may be fundamental to a society’s history and culture.

But the scenario is not one of singularity. Human consciousness and human relations involve the interplay of all three values, and though one may be dominant they may all in reality be present and exist in uneasy tension. Nowhere was this tension more evident than in the United States, where we found teachers seeking to reconcile – and indeed to foster as equivalent values – individual self-fulfilment with commitment to the greater collective good; self-effacing sharing and caring with fierce competitiveness; and environmentalism with consumerism. Meanwhile, in the world outside the school, rampant individualism competed with the traditional American commitment to communal consciousness and local decision-making, and patriotism grappled with anti-statism. As the teacher interviews and lesson transcripts show, such tensions were manifested at every level from formal educational goals to the everyday discourse of teachers and children (Alexander, 2001, pp. 201–206, 490–515).

Conclusion

If globalisation dictates a stronger comparative and international presence in educational research generally, there is a no less urgent need for comparativists to come to grips with the very core of the educational enterprise, pedagogy. Such an enterprise, however, demands as much rigour in the framing and analysis of pedagogy as in the act of comparing. In this chapter I have drawn on a five-nation comparative study of primary education to postulate principles and frameworks for a new comparative pedagogy. Pedagogy is defined stipulatively as the act of teaching together with its attendant discourses, ideas and values. The analysis of this discourse requires both that we engage with culture, values and ideas at the levels of classroom, school and system, and that we have a viable and comprehensive framework for the empirical study of teaching and learning. The interlocking models of pedagogy, teaching and curriculum in Figures 1–3, which were initially developed to frame the *Culture and Pedagogy* data analysis and have since been elaborated, link national culture, structure and policy with classroom agency; but they also allow for the structure–agency relationship to be played out within the micro-cultures of school and classroom.

The focus here is not on the detailed findings of the *Five Cultures* research but on the potential of its analytical framework to support the much-overdue development of a comparative pedagogy. But in arguing the centrality of culture, history and values to a proper analysis of pedagogy, and in applying the chosen frameworks, tools and perspectives to five countries rather than just one or two, we can open up other important domains: of the balance of change and continuity in educational thinking and practice over time, and of pedagogical diversity and commonality across geographical boundaries. In so doing, we are not only forced to reassess the Sadlerian resistance to educational import–export; we also come closer to identifying the true universals in teaching and learning. A properly conceived comparative pedagogy can both enhance our understanding of the interplay of education and culture and help us to improve the quality of educational provision.

Notes

1. This chapter draws in particular on the author's comparative study of culture, policy and pedagogy in England, France, India, Russia and the United States (Alexander 2001) as well as the broader body of published work cited. Several of the author's more recent papers on pedagogy within an international framework may be found in Alexander, R.J. 'Essays on pedagogy' (Routledge, July 2008);
2. The chapter is a revised version of an article which first appeared in the journal *Comparative Education*, 37(4), 507–523.
3. With the permission of the teacher concerned. The ethics of using video as a research tool must always be taken seriously.

PEDAGOGICAL AND EDUCATIONAL CHANGE FOR SUSTAINABLE KNOWLEDGE SOCIETIES

Andy Hargreaves

Introduction

We live in perilously unsustainable times. Because of the developed world's desire for endless progress and limitless consumption, for immediate pleasure and short-term reward, for wanting it all and wanting it now, our planet and its people are now imperilled. And the most underprivileged – the poor and the dispossessed – are the most imperilled of all. Politicians hooked on the instant gratification of short-term elections and quick fix results have exchanged the moral imperative of long-term climate change for the immediate popularity of electoral success – and global poverty, widespread climatological catastrophe, and the migration of millions around the globe are the consequences that now await them.

Currently fashionable educational change and reform strategies similarly threaten to treat our teachers and human resources as unsustainable, just as multinational businesses and politicians have undermined the sustainability of our natural resources. Imposed short-term targets, endless testing and quick political wins at the cost of deep learning for all students, are the enemy of educational sustainability.

In recent years I have written two apparently contradictory books on pedagogy, leadership and change in knowledge societies. *Teaching In The Knowledge Society* (A. Hargreaves, 2003) argues that schools, teaching and learning need to be reconfigured to prepare all young people to participate in transforming their countries into creative knowledge economies, and to have opportunities to be employed at the highest levels of these economies, in high-skill, high-wage societies.

More and more nations are or aspire to be *knowledge economies*. The knowledge society is not just a synonym for information society. In an age of electronic, digital and satellite technologies, knowledge societies address how information and ideas are created, used, circulated and adapted at an accelerating speed in “knowledge-based communities”, that is, networks of individuals striving to produce and circulate new knowledge. In knowledge societies, wealth, prosperity and economic development depend on people's capacity to out-invent and outwit their competitors, to tune in to the desires and demands of the consumer market, and to change jobs or develop new skills as economic fluctuations and downturns require. In knowledge societies, these capacities are not just the property of individuals, but also of organizations, which have the capacity to share, create and apply new knowledge continuously over time in

cultures of mutual learning and continuous innovation. Knowledge society organizations develop these capacities by providing their members with extensive opportunities for lifelong upskilling and retraining; by breaking down barriers to learning and communication and getting people to work in overlapping, heterogeneous and flexible teams; by looking at problems and mistakes as opportunities for learning more than occasions for blame; by involving everyone in the ‘big picture’ of where the organization is going; and by developing the ‘social capital’ of networks and relationships that provide people with extra support and further learning.

The knowledge society is a learning society. Economic success and a culture of continuous innovation depend on the capacity of workers to keep learning themselves and from each other, throughout their working lives.

Schools that educate young people for the knowledge society have to break with many aspects of the past. The agrarian and industrial models of one teacher-one class schooling need to replace standardized instruction that emphasizes only the basics of literacy and numeracy, with a broad and more cognitively challenging and creative curriculum; teachers need to work and inquire into their teaching together rather than teaching in their classrooms alone; professional learning has to be continuous rather than episodic; teachers’ judgments should be informed by objective evidence as well as subjective experience and intuition; and the teaching profession needs to develop dispositions of taking risks and welcoming change rather than staying with proven procedures and comfortable routines. Knowledge society schooling, in other words, demands that we put aside outdated ‘grammars’ of industrial and agrarian models of schooling. It also requires that we abandon their Anglo-Saxon reinvention in the form of narrowly focused, overtested and highly intensified standardized educational reforms that restrict the curriculum, inhibit creative learning, undermine professional morale, and cut off the supply lines of recruitment to leadership. *Teaching in the Knowledge Society*, in other words seems to propose moving forward, by leaving the past behind.

A second book, *Sustainable Leadership* (Hargreaves & Fink, 2006), seems to advocate the antithesis of this position. Drawing on the development of the concept and practices of sustainability in the environmental movement, the definition of sustainable development in the Brundtland Commission Report of 1987 (Brundtland, 1987), and the beginning of the UN Decade of Education of Sustainable Development 2005–2015 (UNESCO, 2005), the book argues against quick fix Anglo-Saxon reform strategies that impose short-term achievement targets, download a hurried curriculum to younger-and-younger age groups, encourage teaching to the test in the all-consuming curriculum of literacy and numeracy, and promote quick fix turnaround strategies for teachers in failing schools.

Drawing on research of 30 years of educational leadership in eight US and Canadian high schools, as well as on our engagement with the literature on environmental and corporate sustainability, Dean Fink and I developed a definition of sustainable leadership:

Sustainable educational leadership and improvement preserves and develops deep learning for all that spreads and lasts, in ways that do no harm to and indeed create positive benefit for others around us, now and in the future. (Hargreaves & Fink, 2006)

From this definition, and our body of research evidence, we then derived seven principles of sustainability in educational change and leadership: depth, breadth, endurance, justice, diversity, resourcefulness and conservation. While all of these are relevant for the future of education and pedagogy in knowledge societies, two are especially pertinent to this article.

First, in terms of depth, sustainable education matters. It preserves, protects and promotes what is itself sustaining as an enrichment of life: the fundamental moral purpose of deep, broad and lifelong learning (rather than superficially tested and narrowly defined literacy and numeracy achievement) for all in commitments to and relationships of abiding care for others.

Second, in relation to the principle of conservation, sustainable education honours and learns from the best of the past to create an even better future. Amid the chaos of change, sustainable education is steadfast about preserving and renewing long-standing purposes. Most educational change theory and practice is change without a past or a memory. Sustainable education revisits and revives organizational memories and honours the wisdom of their bearers as a way to learn from, preserve, then moves beyond the best of the past. It defines and delineates lifelong learning as something that weaves a compelling narrative between past, present and future that binds individuals and society together.

Sustainable knowledge societies seem like oxymorons – as do sustainable knowledge society schools. Knowledge societies promote innovation, they prize all that is new, they depend on rapid learning and they champion the pursuit of change. Sustainable schooling, by contrast, values slow and in-depth learning rather than a hurried curriculum; it asks for patience and endurance in the implementation of change; it calls for prudence and resourcefulness rather than energetic and profligate investment; and it promotes the virtues of conserving the past in a world awash with innovation and change. It requires teaching beyond the knowledge society as well as immediately for it.

How can we reconcile innovation and sustainability in knowledge societies and their schools? How do we build a future on the foundations of the past? How can the energetic innovator and the prudent Puritan live and work together, side by side? This article argues that sustainable knowledge society schools and pedagogies do not rescind or take refuge in the past, but connect it to a compelling and motivating vision – economic and social – of where people and their societies are moving in the future.

Past, Present and Future

Educational and pedagogical change often has no place for the past. The arrow of change moves only in a forward direction. The past is a problem to be ignored or overcome in the rush to get closer to the future (McCulloch, 1997). For those who are attracted, even addicted to change, the past is a repository of regressive and irrational resistance among teachers who like to stay where they are and are emotionally unable to ‘let go’ of old habits, attachments and beliefs. Or the past is a pejorative, a dim and Dark Age of weak or bad practice, that leaves negative legacies of regimented factory models of schooling, or ‘uninformed professional judgment’ in teaching that get in the way of modernization.

When change has only a present or future tense it becomes the antithesis of sustainability. Indeed, Abrahamson (2004) describes how *repetitive change syndrome* with its interminable downsizings, restructurings and re-engineerings, leads to massive haemorrhaging of staff and leadership, and with it, a 'loss of *organizational memory*'. No one is left behind to celebrate the organization's tradition, to be living bearers of its purpose and mission, to pass on the knowledge and expertise of how best to do things or to show new recruits the short cuts and the ropes.

Instead of treating the elders of the education profession as toxic teachers who are resistant to change, it is important to approach them as renewable and renewing resources who, through opportunities for mentoring, continuous learning and involvement in improvement, can actually raise the quality of their school's environment and its products. In this sense, teacher wisdom and organizational memory have to be part of the solution to educational change, not just part of the problem. As South Africans have inspirationally understood, those who embody the past are also an inalienable part of our common future. There are at least three ways in which this essential educational and societal connection is dismissed or denied.

Present Immersion

Sometimes, the threat to synthesizing the future with the past is not active dismissal of the past, but indulgent immersion in a present that seems to have no exits or entrances. In an age of economic insecurity and declining credibility in the commitment and capacity of politics to control the future, it is little wonder that people invest their passions and purposes in the present. But in the post-industrial knowledge society, the flight from the future is marked less by fatalistic resignation among the poor than by energetic indulgence among more socio-economically advantaged groups. At a time of insecurity, many people deal with the finality of death and the end of the future differently than their generational predecessors. They do not save to leave a legacy, prudently prepare for the ultimate rewards of religious eternity, or even sacrifice themselves on the battlefield for the greater good of national identity or security. Rather, they deny and try to cheat and control death by what Bauman calls the marginalization of concerns with finality, through the devaluation of anything durable, long-lasting, long-term; the devaluation of anything likely to outlive individual life. (Bauman, 2006, p. 39)

In post-industrial presentism, people "delay frustration, not gratification" (Bauman, 2006, p. 8). They live on credit, lift their faces, spend their children's inheritance, and shop in orgies of consumption where everyone imagines they will be forever young in a world that gives no thought to tomorrow.

This consumption of the present is supported and stimulated by a workplace environment which values moving on rather than settling in, short-term interactions rather than long-term relationships, and migration from task to task rather than pride in mastering a challenging craft (Sennett, 2001). In Richard Sennett's words:

The social skill required by a flexible organization is the ability to work well with others in short-lived teams, (with) others you won't have the time to know

well. Whenever the team dissolves and you enter a new group, the problem you have to solve is getting down to business as quickly as possible with these new teammates. (Sennett, 2006, p. 126)

No critical engagement, no challenge to the organization's purposes, no long-term thinking or moral depth is required or desired here, for "institutions based on short-term transactions and constantly shifting tasks ... do not breed that depth. Indeed, the organization can fear it" (Sennett, 2006, p. 105). Seduction by the short-term, immersion in the interactions of the present "divides analyzing from believing, ignores the glue of emotional attachment, penalizes digging deep" (Sennett, 2006, p. 121–122). In this all-consuming present-time environment, "your skill lies in cooperating, whatever the circumstances" (Sennett, 2006, p. 126).

These predilections and preoccupations are evident in a project that my colleague Dennis Shirley and I evaluated in England in which more than 300 schools that had a dip in measured performance over 1 or 2 years, were networked with each other, provided with technical assistance in interpreting achievement results, given access to support from mentor schools, and offered a modest discretionary budget to spend in any way they chose provided it addressed the goals of the project (Hargreaves et al., 2006). Participating schools were also provided with a practitioner-generated menu of proven strategies that bring about short-, medium- and long-term improvement.

Schools were spectacularly successful in improving in the short term, but few had begun to engage in longer-term improvement processes. Dialogue about deep transformations in teaching were largely yet to occur. Instead, teachers and schools were excitedly implementing and exchanging short-term change strategies such as providing students with test-taking strategies, paying past students to mentor existing ones, feeding students with lettuce, water and bananas before testing events, or collecting mobile phone numbers to contact students who were not showing up on examination days.

In the past, imposed short-term targets and strategies have been experienced by many teachers as an unwanted professional intrusion (A. Hargreaves, 2003). But the underperforming schools project has conquered teachers' aversion to short-term measurable improvement through peer-supported, professionally validating strategies that make real differences to the measured attainment of the students that teachers teach in the here-and-now.

Yet the new short-term strategies and the means of acquiring and exchanging them are now so satisfying and successful that they have become a form of addiction, rather than aversion. These strategies are "so gimmicky and great", as one head teacher put it, they can be used right away, and do not challenge or encourage teachers to question and revise their existing approaches to teaching and learning. The rush to raise achievement injects teachers with a repeated "high" of short-term success. The result is a somewhat hyperactive culture of change that can be exhilarating but also draining and distracting.

In one of the conferences we observed, the majority of the strategies shared by heads and assistant heads at their tables were short-term. Not only are these strategies quick and easy to implement but they are quick and easy to explain – especially in a setting that has limited opportunity for extended conversations. Those heads who share

common interests frequently and excitedly exchange ideas and then business cards in ‘speed dating’ exercises just before they leave.

When these excitable exchanges are added to the logic of short-term funding of proposal bids, of a policy culture characterized by immediacy and a teaching culture already steeped in a present-time orientation, along with a performance-driven language in which teachers and head teachers refer not to engagement with learning but to the movement of students into the right achievement cells by ‘targeting’ the right groups, ‘pushing’ students harder, ‘moving’ them up, ‘raising aspirations’, ‘holding people down’ and ‘getting a grip’ on where youngsters are, the result is a combined pressure to preserve and perpetuate the short-term orientation of the present, with no incentive or encouragement to think about or prepare for the future. In this scenario of pedagogical change, the future recedes behind a never-ending present of increased effectiveness that lacks pedagogical transformation.

By contrast, other proposals for pedagogical and educational change neither dismiss nor deny the past, but return to it as a way to reinvent the future. These ‘back to the future’ approaches present the future in terms of the past.

Past Restoration

When at the beginning of 2007, the Japanese government led by the grandson of the nation’s Prime Minister in the Second World War, proposed to reintroduce patriotism into the curriculum, it was responding to an age of increasing uncertainty and insecurity in family values, cultural identity and an older work ethic by connecting nostalgic images of a prideful past with the prospect of a more unified future. Similarly, the British Government’s specification of history as British history and literature as English literature, in its National Curriculum of the 1990s, sought to restore national pride and parental confidence in schools, by alluding to ideas and images of imperial certainty (Goodson, 1994).

One of the most dramatic contemporary examples of this strategy of recycled change is to be found in the United States. Early in 2007, the US National Center for Education and the Economy released a report *Tough Choices or Tough Times* by its New Commission on the Skills of the American Workforce. In its sequel to its 1990 Commission Report that drove much of the educational standards movement in the United States, this august body, comprising two former Secretaries of State, several state and metropolitan Superintendents and Chancellors of Schools, along with an assortment of business CEOs and union leaders – launched a blistering critique of the inability of the nation’s underperforming and inflexible public education system to meet the challenges and seize the opportunities of the contemporary global economy.

Belatedly following (though scarcely acknowledging) the lead of international policy-steering organizations like OECD (2000); finally heeding the long-standing prognostications of the late management guru and futurist Peter Drucker (1993), and eventually coming into congruence with knowledge society analysts such as Phillip Schlechty (1990) and myself (A. Hargreaves, 2003), the Commission pointed to America’s declining educational performance compared to other advanced industrial

nations. The reasons for the decline, the Commission argued, were rooted in the relatively poor quality of the nation's teaching force, in a system that had become skewed by the excesses of narrowly tested standardization that was ill-equipped to produce the creativity and innovation necessary for a high-skill, high-wage workforce in a rapidly changing global economy.

In the words of the Commission, establishing economic advantage and leadership in the global economy

depends on a deep vein of creativity that is constantly renewing itself, and on a myriad of people who can imagine how people can use things that have never been available before, create ingenious marketing and sales campaigns, write books, build furniture, make movies and imagine new kinds of software that will capture people's imaginations and become indispensable to millions. (New Commission on the Skills of the American Workforce, 2007, p. xviii)

Educationally, the Commission argued, these economic demands require much more than a conventionally and unimaginatively tested curriculum focusing on basic skills and factual memorization that prepare most people only for the routine work of low-skill economies which other nations or mere machines can now perform more cheaply than the US workforce. Success in a broader, deeper, more imaginative curriculum for all is called for instead:

Strong skills in English, mathematics, technology and science as well as literature, history and the arts will be essential for many; beyond this, candidates will have to be comfortable with ideas and abstractions, good at both analysis and synthesis, creative and innovative, self-disciplined and well-organized, able to learn very quickly and work well as a member of a team and have the flexibility to adapt quickly to frequent changes in the labour market as the shifts in the economy become ever faster and more dramatic. (New Commission on the Skills of the American Workforce, 2007, pp. xviii–xix)

Yet the specific remedies to bring about this apparent shift towards an agenda of apparent post-standardization in education in order to increase competitiveness in the global economy seem to lack any semblance of the very creativity that they are supposed to secure.

The Commission's retrograde theory-of-action (Hatch, 2002) proposes more and better educational access and provision for all before and after formal schooling, along with parallel support for the health and social service needs of children that are integrated into the school setting. Though this is admirable enough, within the school itself, all that is called for is a more challenging and broad curriculum with demanding exit exams. This, it is proposed, will cultivate the harder work among students that is presumed to be lacking in schools' expectations and student culture. Higher calibre teachers whose job it is to deliver the more challenging curriculum will be attracted by higher starting salaries and more flexible pay and pension structures linked to performance rather than seniority. Competitiveness (though not overt selectiveness) among

schools will be encouraged by detaching them from all but skeletal school district control, creating opportunities to innovate as well as network with other schools within and outside the immediate vicinity – with procedures for intervention and takeover being retained in cases of serious underperformance or crisis. All this will be achieved by reallocating rather than increasing financial resources.

In effect, the New Commission's way forward into the age of post-standardization is an intrinsically, inimically and individually American one that returns to and reinvents the retrograde solutions of ruthless and rugged competitive individualism that in combination with the strictures of soulless standardization, have brought the United States to its educational knees in the first place.

Unlike most other countries, the New Commission proposes to retain its inflexible grip on curriculum content and standards, and to devolve only the administrative means (or blame!) for delivering it. Similarly, its strategy of attracting higher calibre teachers through restructured, performance-related pay ignores the extensive historical evidence at home and abroad that it is poor working conditions, excessive outside interference and ineffective leadership that pulls teachers away from the poor, not a lack of extrinsic or restructured benefits (Lortie, 1975; Nias, Southworth & Yeomans, 1989; Achinstein & Ogawa, 2006). Moreover, the report's proposed solutions and the theory-of-action on which they are based raise only half of the educationally pressing issues posed by a climate of competitive globalization. They pay no attention to reforms that serve the public good as well as the private economic good, through developing greater compassion, community, citizenship, democracy and cosmopolitan identity, for example. In short, America's most influential educational commission proposes to increase educational innovation and creativity by considering only the economic purpose it serves, and by clinging even more grimly to the strategies of curriculum centralization and school competitiveness that have undermined the nation's educational effectiveness in the first place.

Consuming Customization

Lastly, visions of pedagogical change that do not dismiss, deny or recreate the past sometimes promise something more radical, innovative and fresh in means as well as ends. On closer inspection, however, they can turn out to be not powerfully transformative at all. Thus, the UK Gilbert Committee's report on personalized learning (Gilbert, 2006; D. Hargreaves, 2004), seems to advocate transformations in learning and pedagogy that move beyond standardization in a knowledge society age. Yet in practice, what is advocated is not so much *personalization* that connects learning to lifelong narratives and projects of a nation's learners and citizens, but customization of that learning so it becomes merely more flexible in how it is accessed, delivered and packaged – like loading up an ipod or ordering options for one's car. Learning here can be accelerated or slowed down, customized and modularized, accessed in school or online, on-site or off-site, with others or alone, attuned to pre-identified learning styles and presented in modules assembled for personal preference and customized choice.

Like ordering and tailoring soft-furnishings and fashions, this kind of learning is streamlined and stylized, but it is a learning that is silent about content, purpose or mission in a pedagogical relationship that is disinvested of personal and social meaning. There is fast and flexible learning for individual creators and consumers of the existing society, not learning that connects individuals to their cultures and their world in lifelong engagement with their histories, the communities around them, or the futures that they might create together.

Pedagogical Change and Continuity

Sustainable education and improvement is about connecting the present, the future and the past in ways that reduce poverty, alleviate inequities, and strengthen communities and democracies within a context of sustainable economic and social development. While it should never blindly endorse the past, sustainable educational change should always respect and learn from it as it strives for a better (though not necessarily bigger) future. Three examples offer quite differing ways of achieving this.

Indigenous Engagement

World Bank intervention and investment strategies are often seen as providing reform solutions of standardization, privatization and decentralization that are insensitive to local cultures which are treated as impediments that are rooted in the past rather than assets for building a better future. Such strategies dismiss and deny the past as they engage in the ‘creative destruction’ that brings in their desired future. While this criticism may hold for many projects, an evaluation that my colleague Paul Shaw and I conducted of 17 World Bank/DfID projects revealed some interesting outliers of practices and pedagogies that worked *with* the local cultures rather than against them (Hargreaves & Shaw, 2006).

In Namibia, modest and prudent donor support has helped local training centres collect data about local consumer demand and about market saturation points for skills, so this can inform and guide discussions about training courses and provision on a just-in-time, one- or two-year basis, as fluctuating local conditions demand.

In Peru, the asparagus industry has been built on a well-developed formal educational base, at the core of which is a public agricultural university, the Universidad Nacional de la Molina, in Lima, where most of the entrepreneurs in the asparagus industry were trained. These entrepreneurs, in turn, learned new techniques in asparagus growing and processing from US (green) and Spanish (white) asparagus growers. Peruvian entrepreneurs were brought to the United States by USAID to learn these new techniques. Spanish investors, on the other hand, came to Peru to take advantage of lower wages. In both cases, technology transfer took place and was adapted to Peruvian conditions. Further, Peruvian entrepreneurs learned (and continue to learn) advanced techniques of irrigated desert agriculture by taking courses in Israel. Peru’s asparagus producers are organized into an association that disseminates information and assists with marketing. In addition, the university at La Molina produces research on new export crops as well as pest and disease control that is made available

to asparagus producers, constantly adapted to local conditions, and taught by larger growers to technicians and small farmers. All this lifelong learning has high pay-offs for economic development. The Peruvian asparagus industry exemplifies the value of treating the public and private sectors not as opponents but as allies, working together to support lifelong learning and training that promotes the greater economic and social good.

One of Unilever's soap factories in Indonesia treats water from the nearby river to manufacture soap, toothpaste and shampoo – since they all require clean water. It is in Unilever's commercial interest to improve water quality in Indonesia and also part of its social and environmental responsibility. Unilever Indonesia's Clean River programme focuses sustainably on involving and training everybody living along the river to contribute to its improvement and provides training so that the villagers can look after the river in a self-sustaining way.

All these cases show how local, long-standing, indigenous knowledge need not be an impediment to knowledge economy development. Rather, traditional culture can be regarded as cultural capital, whilst also retaining social value in its own right. To say this is not merely to show tolerance for difference and comparison for the weak. It is to acknowledge and engage with the strength of traditional knowledge as a firm foundation for innovation and knowledge development in the future.

In *Teaching In The Knowledge Society* (A. Hargreaves, 2003), I argued that it was important for teachers and schools to teach *beyond* the knowledge society as well as for it – balancing fast-paced knowledge society emphases on innovation and creativity with the development of loyalty, trust and social cohesion. But it is now clear that connecting the present to the future and the past is more than a matter of compensation and balance. This connection is at the very heart of what it means to be a knowledge society that is sustainable as well as successful in a society that develops trust and loyalty, inclusion and equity, safety and security as foundational qualities of a high-functioning society and economy. In such a society, cosmopolitan identity promotes humanitarian understanding as well as the society and economy's ability to draw on and develop the talents of *all* its people. And education for sustainable development helps preserve the planet without which future economic activity is impossible.

These principles, which illustrate how the social good and economic good are intertwined, are evident not only in the less-developed country examples just described, but also in some of the highest performing economies and educational systems in the world. Foremost among these is Finland.

Finnishing School

In January of 2007, with team colleagues Gabor Halasz and Beatriz Pont, I undertook an investigative inquiry for OECD into the relationship between leadership and school improvement in one of the world's highest performing educational systems and economies: Finland. After visiting and interviewing students, teachers, head teachers, system administrators, university researchers and senior ministry officials, a remarkably unified narrative began to surface about the country, its schools and their sense of aspiration, struggle and destiny.

Finland is a nation that has endured almost seven centuries of domination and oppression – achieving true independence only within the last three generations. In the context of this historical legacy, and in the face of a harsh and demanding climate and northern geography, it is not surprising that one of the most popular Finnish sayings translates as ‘It was long, and it was hard, but we did it!’

Yet it is not simply stoic perseverance, fed by a Lutheran religious ethic of hard work and resilience that explains Finland’s success as a high-performing educational system and economy. At the core of this country’s success and sustainability is its capacity to reconcile, harmonize and integrate those elements that have divided other developed economies and societies – a prosperous, high-performing economy and a decent, socially just society. While the knowledge economy has weakened the welfare state in many other societies, in Finland, a strong welfare state is a central part of the national narrative that supports and sustains a successful economy.

In *The Information Society and the Welfare State*, Castells and Himanen (2002, p. 166) describe how

Finland shows that a fully fledged welfare state is not incompatible with technological innovation, with the development of the information society, and with a dynamic, competitive new economy. Indeed, it appears to be a decisive contributing factor to the growth of this new economy as a stable basis.

The contrast with Anglo Saxon countries where material wealth has been gained at the expense of increasing social division, and also at the cost of children’s well-being (UNICEF, 2007) could not be more striking:

Finland stands in sharp contrast to the Silicon Valley model that is entirely driven by market mechanisms, individual entrepreneurialism, and the culture of risk – with considerable social costs, acute social inequality and a deteriorating basis for both locally generated human capital and economic infrastructure. (Castells & Himanen, 2002, p. 167)

At the centre of this successful integration that, in less than half a century, has transformed Finland from a rural backwater into a high-tech economic powerhouse, is its educational system. As the respondents interviewed by the OECD team indicated at all levels, Finns are driven by a common and articulately expressed social vision that connects a creative and prosperous future – as epitomized by the Nokia telecommunications company whose operation and supplies account for about 40% of the country’s GDP (Haikio, 2002) – to the people’s sense of themselves as having a creative history and social identity. One of the schools we visited was just two miles from the home of Finland’s iconic composer Sibelius. And the visual, creative and performing arts are an integral part of all children’s education and lifelong learning all through and even beyond their secondary school experience.

Technological creativity and competitiveness, therefore, do not break Finns from their past but connect them to it in a unitary narrative of lifelong learning and societal development. All this occurs within a strong welfare state that supports and steers

(a favourite Finnish word) the educational system and the economy. A strong public education system provides education free of charge as a universal right all the way through school and higher education – including all necessary resources, equipment, musical instruments and free school meals for everyone. Science and technology are high priorities, though not at the expense of arts and creativity. Almost 3% of GDP is allocated to scientific and technological development and a national committee that includes leading corporate executives and university vice chancellors, and that is chaired by the Prime Minister, steers and integrates economic and educational strategy.

As Finnish commentators and analysts have also remarked, all this educational and economic integration occurs within a society that values children, education and social welfare, that has high regard for education and educators as servants of the public good, that ranks teaching as the most desired occupation of high school graduates, and that is therefore able to make entry into teaching demanding and highly competitive (Sahlberg, 2006; Aho, Pitkanen & Sahlberg, 2006).

Within a generally understood social vision the state steers but does not prescribe in detail the national curriculum – with trusted teams of highly qualified teachers writing the detailed curriculum together at the level of the municipality, in ways that adjust to the students they know best. In schools characterized by an uncanny calmness, teachers exercise their palpable sense of professional and social responsibility in their efforts to care especially for children at the bottom, so as to lift them to the level of the rest. This is achieved not by endless initiatives or targeted interventions but by quiet cooperation (another favourite word) among all the teachers involved.

Head teachers in Finland are required by law to have been teachers themselves and most continue to be engaged in classroom teaching for at least 2–3 hours per week – which lends them credibility among their teachers, enables them to remain connected to their children, and ensures that pedagogical leadership is not merely high-flown rhetoric but a living, day-to-day reality.

It is important to acknowledge that Finland's integration of the information economy and the welfare state as a continuous narrative of legacy and progress that defines the national identity is not without its blind spots. Having been an embattled and oppressed historical minority, Finland, in comparison to many other nations, remains a somewhat xenophobic society, suspicious of immigrants and outsiders, and threatened by those who challenge or diverge from the Finnish way of life (Castells & Himanen, 2002). Without a willingness to accommodate higher rates of immigration, the impending retirement of large proportions of Boomer employees (as many municipal administrators described it to us) will also increase the financial burden on the welfare state, and jeopardize the basic sustainability of Finland's economy and society that depends on it.

Nonetheless, Finland contains essential lessons for societies that aspire, educationally and economically, to be successful and also sustainable knowledge societies. Building a future without breaking from the past; supporting not only pedagogical change but also continuity; fostering strong connections between education and economic development without sacrifice to culture and creativity; raising standards by lifting the many rather than pushing a privileged few; connecting private prosperity to the public good; developing a highly qualified profession that brings about improvement through

commitment, trust, cooperation and responsibility; embedding and embodying pedagogical leadership into almost every head teacher's weekly activity; and the emphasis on principles of professional and community rather than managerial accountability – these are just some of the essential lessons to be taken from Finland's exceptional educational and economic journey.

Activist Engagement

If Finland seems like an exclusionary and atypical exemplar of pedagogical change within sustainable knowledge societies, the edgy streets of culturally diverse Los Angeles perhaps provide a sterner test of how to drive pedagogical change within a compelling and inclusive social vision that is also underpinned by a clear theory of change in action.

Jeannie Oakes and her colleagues at the University of California, Los Angeles, argue that conventional change and reform strategies fail because the learning and teaching envisaged do not have clearly articulated goals concerning social justice other than ones narrowly concerned with tested achievement and achievement gaps (Oakes, Rogers & Lipton, 2007). Moreover, the strategies for bringing about change are directed at and driven by school and school system professionals with little involvement of students and parents other than as targets or consumers of the change effort. In this sense, neither the means nor the ends of most change efforts, nor the theories of action that underpin them, challenge or confront the structures of power and control in society that systematically protect the schools, programmes and pedagogical strategies that are especially advantageous for elites and their children.

In response, Oakes and colleagues (2006) draw on John Dewey's (1927) principles of participative inquiry as well as American traditions of community activism and organizing to propose classroom and school-level changes that raise achievement and secure wider improvement, by connecting low achieving poor and minority students to university researchers and teacher networks that train and support them to inquire into, then act upon the conditions of their own education and lives. Such forms of collaborative inquiry are not merely culturally responsive pedagogies that respond to the culturally variable learning styles of diverse students (Ladson-Billings, 1995); nor are they simply acts of cooperative instruction or intellectual creativity that enhance cognitive achievement. Rather, in line with the legacy of Paulo Freire (2000), these practices, which Oakes and colleagues help create in practice as well as in theory, increase achievement and improve the conditions for other people's achievement by helping students inquire into, understand and want to act on the conditions that affect the lives and education of themselves and their communities – dilapidated buildings, large class sizes, divisive streaming (tracking), inadequate books and materials, shortages of qualified teachers, and restricted opportunities to learn.

These pedagogically transformative practices are linked to an activist orientation among involved students and also among parents and local communities who challenge bureaucrats and legislators with evidence-based arguments as well as disruptive strategies and knowledge, to provide genuinely equal opportunities for the poor as well as the affluent. In the words of an old Irish rebel song, these strategies are "the wind that shakes the barley".

These living “pedagogies of the oppressed” may not be able to be scaled up everywhere – especially beyond the large urban centres where local research and philanthropic capacity is strong (an objection that the authors sweep aside a little too easily) – but networks of advocacy for publicly driven, rather than bureaucratically imposed reform are spreading rapidly across America (Shirley & Evans, 2007), with activist pedagogies of inquiry among parents and students alike being a fundamental factor in this growing arena of influence.

Conclusions

What can we conclude about pedagogical change in sustainable knowledge societies? Since the publication of *Teaching in the Knowledge Society* (A. Hargreaves, 2003), the evidence has persisted that economic success and prosperity still depend on successful innovation in information-based activity. Success and prosperity also depend on the capacity, in every sphere, to access and circulate knowledge inclusively and intensively so as to accelerate the pace of economic competitiveness along with the efficiency of public services by increasing personal awareness, connectedness and responsibility – even and especially among the infirm and the elderly (Castells & Himanen, 2002).

The necessity therefore remains of cultivating pedagogies that emphasize creativity; that develop applied knowledge as a way of increasing problem-solving capacities; that promote lifelong learning and the capacity to adapt and change as the work environment requires; and that customize teaching and learning so learning can be accessed in places, styles and genres that are the most effective for every individual student and that maximize their achievement and ability.

Written and published shortly after 9/11, *Teaching in the Knowledge Society* raised parallel problems of justice, humanity and security. These have only increased in intensity. When the world’s wealthiest nation converted its outrage over 9/11 into military conquest of the planet’s most ancient civilization, and when its Anglo-Saxon allies across the Atlantic and Pacific determined, almost alone, to join it, it was not democracy and stability but death and displacement of people and their families that spread across the Middle East in consequence – and increased terrorism, insecurity and fundamentalism, rapidly followed in their wake.

Moreover, a report by UNICEF (2007) of children’s well-being in 21 countries which ranks two of the world’s wealthiest economies – the United Kingdom and the United States – at the very bottom of the league table of all the industrialised nations covered by its survey, demonstrates that wealth and prosperity give no guarantees for justice and well-being.

As our human and planetary crises become more palpable, new pedagogies of humanity are beginning to surface – promoting citizenship, fostering emotional literacy and attending to children’s well-being. Curriculum interventions are being made in history and geography, teaching about environmental sustainability, or what it means to all cultures within a nation to be American, Japanese or British. But these measures are typically tacked on to, rather than substituted for existing pedagogical practices. Such citizenship courses, curriculum changes, emotional literacy programmes and other

interventions only inundate the system and overwhelm its teachers and leaders with repeated waves of unwanted initiatives that intensify the repetitive change syndrome that Abrahamson (2004) has described.

How is it, my OECD colleagues and I in Finland asked, that head teachers could still teach as well as lead in their high performing educational system on the leading edge of the global economy? “Because”, one said, “unlike the Anglo-Saxon countries, we do not have to spend our time responding to long, long lists of government initiatives that come from the top”.

The pedagogical solutions for a sustainable knowledge society are to be found not in government obsessions with targets and test scores, nor in the political panics that precipitate endless interventions and initiatives. Nor are they even necessarily to be found in energetic pedagogical innovations in multiple intelligences, cooperative learning strategies, or brain-based learning, for example. Finnish teachers, for instance, are notoriously low key and even a little conservative (though not stubbornly traditional) in their pedagogical strategies (Sahlberg, 2006; Aho, Pitkanen & Sahlberg, 2006).

Instead, on the world’s economic fringes, we have seen the benefits of connecting innovative modernization to long-standing indigenous knowledge. In Finland we can also see how curriculum, pedagogy and counselling, can be woven together in an integrated educational vision and practice that is also connected to a social vision of where the individual and society have been and are headed – a vision that is steered by a trusted state but never micromanaged by a meddling political bureaucracy. Last, in the City of the Angels, we have seen the value of participative inquiry and social activism in engaging students in understanding, then acting upon the oppressive conditions that restrict their learning – showing that the teaching and learning strategies of socially sustainable knowledge societies are not just intellectually creative and clever but also morally driven and socially just.

Our past is part of our future. If we try to push our baggage aside in our rush towards progress, we will only find that we keep falling over it. Prosperity for all is a proper goal, but not at any price. Sustainability, social justice and sheer survival must now be our chief priorities. And humanistic, creative, participative pedagogies, in schools where every child truly matters, that are steered by trusted systems and driven by parental engagement rather than flooded with unwanted initiatives offer some of the most promising ways forward.

The knowledge and information society should be able to live with a strong and supportive welfare state. The lion can lie down with the lamb. Prosperity and security have to coexist, side by side. The last two decades have been dominated by Anglo-Saxon strategies of ruthless, measurement-driven improvement and intervention that have incurred only widespread poverty and inequity and other social waste. It is now time for other more sustainable sensibilities to take their place.

EDITORIAL INTRODUCTION: NEW THINKING

Robert Cowen

One of the official Reports on education in England began with an ambiguous phrase of the kind ‘at the heart of the education system lies the child’. I was much taken by the phrase and I wondered how the normally impeccable prose-writers of the British Civil Service had managed to come up with that. Simple words, certainly, if a little worrying. They can be borrowed: the sentence ‘at the heart of comparative education lies the educational system’ creates a useful ambiguity.

‘The educational system’ is one of our problems. By accepting the ‘educational system’ into the heart of an academic, university-voiced, comparative education we give ourselves four immediate problems:

1. On what basis may education systems be judged? That is, the relativism problem.
2. On what basis may education systems be acted upon? That is, the praxis problem.
3. On what basis may education systems be described? That is, the banality problem.
4. On what basis may education systems be interpreted? I referred to this earlier in these volumes as the ‘osmosis problem’.

These problems are, of course, magnified when ‘comparative education’ takes up its full complexity and addresses the problematique of ‘transfer’ within a theory of international educational relations that in turn is part of an interpretation of international economic and political relations.

But to stay on the simpler version of the problem – how are we dealing with the issues of relativism, praxis and banality and where do they lead us to?

The Relativist Problem

The relativist problem was partly disguised by the twin (liberal) promises of progress and betterment of the human condition. Thus, depending on which comparative educations you look at in which time periods, there tends to be a promise of better understanding or easier reform. In Sadler, the promise of comparative education – of looking at the foreign – is to get a better understanding of what is at home. Lauwerys, at the personal level, was deeply committed to the proposition that ‘since wars begin

in the minds of men, it is in the minds of men that the defences of peace must be constructed'. His comparative education was (partly) inspired by the need for international understanding.

However, in the professional literature of comparative education it is difficult to find a condemnation of the educational patterns in apartheid South Africa, of the inversion of the principle of selection-by-class in the USSR, of the Cultural Revolution in China and of the extremes of pressure imposed on children in Japan or Hong Kong or South Korea by the examination systems. Rarely are educational systems condemned – with the obvious exception that there are protests about oppressed identities: raced, coloured, gendered and religious.

Comparative educationists are presumably no more and no less polite or bad-tempered than other academics. They do however have a special problem: part of the initial immersion in the field involves learning to like the strange, the exotic and the difficult-to-understand. Tolerance of, and empathy with, the foreign is encouraged, as a professional and acquired virtue.

It is only the invocation of universal principles which upsets this balancing act. At the intersection of an important aspect of personal identity and a system of education which violates that identity, there might be something of a personal condemnation: George Bereday and Edmund King had one such argument in public, in print, about class and race.

Vaguely internationalist, occasionally gently Marxist or neo-Marxist, professionally relativist, when does comparative education judge, other than on the basis of personal conviction politics, PISA scores, expatriate identity, or (these days) on principles of political correctness? When should it judge and on what criteria?

The Praxis Problem

It may with some confidence be asserted that the American education system is poor. More precisely, the overseas observer of US education notes a flow of detailed criticism offered in academic voices during the last 40 years. Clearly, then, this educational system is bad and in need of development by external consultants, and international aid – the United States is a suitable case for treatment.

Equally clearly, that is not going to happen.

Action upon and even the most trivial 'consultancy' on educational systems by foreigners normally occurs under quite specific conditions of imbalances in political and economic power and the adoption of supplicant status – or through occupation, as in Japan and Germany in 1945. It is also quite useful that what is 'wrong' with the educational system should be a normal action-puzzle: poor literacy rates, insufficient numbers of females graduating, ineffective and inefficient schooling, and now recovery from violence. 'Organised and applied comparative action' – the transfer of a limited range educational ideas, principles and processes – is predicated upon a lack of domestic capacities to act successfully including cash and skill deficiencies, politically supplicant status and the existence of aid conduits.

Thus, apart from questions about 'translations' (that is, understanding the local well enough to understand the shape-shifting which will and should occur if a 'foreign'

education pattern is introduced at home), there is an even greater moral or ethical problem. In the comparative education-of-action, when do we say 'no', especially (a) noting that much of comparative education-in-action occurs within very unequal political and cultural and economic relationships and (b) noting the relativist problem of non-judgemental comparative education? Do you consult in Burma? When and why?

The third problem relates both to comparative education-in-action (what else do you know than something about educational systems) and to comparative education as the study of educational systems in social and cultural contexts (the osmotic problem).

The Banality Problem

Consider the traditional categories we use for describing educational systems: aims, structure (the pattern of first- and second-level schools), administration and management, finance, curriculum, teacher education, examinations, perhaps vocational technical education, and maybe higher education.

Of course there are specialists who do offer a complex and sociological, or complex and historical, understanding of particular layers or levels of an educational system. Robin Alexander on curriculum; Peter Jarvis on lifelong learning; Guy Neave on higher education – all come to mind and have chapters in these volumes. But in general it is difficult to avoid the thought that collecting descriptions of educational systems is like collecting train numbers: interesting only if you are already hooked on the hobby.

But the situation gets worse and the banality then turns into something slightly more complex.

Describing educational systems leads relatively rapidly to identifying subsequently the 'similarities and differences'. The problem has suddenly become the clichés of the field – comparative education compares; it juxtaposes educational descriptions; and it identifies similarities and differences. But again and in general, it is difficult to avoid the thought that identifying 'similarities and differences' in educational systems is like collecting train numbers: interesting only if you are already hooked on the hobby.

The situation gets even worse. If comparative education is primarily the juxtaposition of educational descriptions constructed in the traditional categories of description identified above, and if these descriptions contain similarities and differences which can be specified, then the similarities and differences need to be explained – which traditionally has taken comparative education towards the identification of the causes of similarity and difference (and, normally, J. S. Mill).

Thus comparative education traps itself by accepting its earlier traditions and pedagogic talk too lightly. It traps itself into banalities of form (the juxtaposed descriptions); the banality of what it narrates – descriptions heavily influenced by the levels of educational systems for which different administrators are normally responsible; and a very traditional model of how you can come to know 'the causes of things'.

But it is the osmotic problem – the relation of things outside the school to things inside the school – which gives intellectual life to this narrative aspect of comparative education (the description of educational systems) so there is a double triviality here. The lists of similarities and differences in educational descriptions of systems are not

even what need to be explained. Fortunately you cannot get that kind of article published any more.

Nevertheless, the consequences of all of this are massive:

- The intellectual agenda of comparative education becomes limited in time (only studies of ‘the educational system’ count as comparative education).
- The classic form of comparative education becomes the juxtaposition of educational descriptions, perhaps with unsystematic comments about context.
- Anything educational can be compared: the number of hours spent on homework in two or more countries; attitudes to first-cycle schools by mothers; and whether teachers are happy.
- However, in general what is described in routine comparative work is some salient, contemporary aspect of educational policy.

Thus we construct – starting from Jullien – a modernist trap for comparative education.

The modernist trap has several characteristics:

- (i) Only certain space–time patterns are worth serious investigation.
- (ii) Investigations outside such space–time patterns of contemporary history are proto-comparative education because they do not investigate ‘the educational system’. Thus most of the educational experiences of the world are left undisturbed and unexplored.
- (iii) ‘The educational system’ and advice on salient policy problems become the point of comparative education – both its praxis and its intellectual work.
- (iv) Among policy problems, the urgent and visible ones are the work agenda; this confirms comparative education as being accountable and relevant and useful.
- (v) The anterior work for this needs to be informed by the specification of similarities and differences in educational provision and an understanding of the causes of these differences through ‘the comparative method’.

Partly as a consequence of this definition of university-based comparative education as a very modern (or late-modern) field of study and as a highly ‘relevant and useful’ area of intellectual work – a theme which ties well with much of our normalising history of ourselves – comparative education is increasingly visible and ‘successful’. The surface structures of comparative education (its journals, its departments, its professional societies) look to be fine.

Below the surface of consultancies done, students graduated, contracts gained, journals launched and revitalised, there are confusions over what comparative education currently is, and what it might be.

The point now is to rethink. In this section (as well of course as in Section Eight of the Handbook) new questions and some new answers are sketched.

There are some alternatives to being merely modern.

MAPPING COMPARATIVE EDUCATION AFTER POSTMODERNITY

Rolland G. Paulston^{†1}

To Isaiah Berlin, in Memoriam

Two extravagances: to exclude Reason, to admit only Reason.

(Blaise Pascal, *Pensées*)

He who would do good to another must do so in Minute Particulars: General Good is the plea of the scoundrel, hypocrite and flatterer; For Art and Science cannot exist but in minutely organized Particulars.

(William Blake, *Jerusalem*)

This article examines the postmodern challenge to how we have come to see, represent, and practice comparative and international education. More specifically, I ask three questions: (1) Can a close reading of the relevant literature identify and type major positions or arguments in the postmodernism debate in our field? (2) How might these positions or knowledge communities be mapped as a discursive field of diverse perspectives and relations? Then, using this “heterotopia” of different ways of seeing Blake’s minute particulars or mininarratives, (3) What might we reasonably conclude about the postmodern challenge of multiperspectivism and its impact on how we as comparativists choose to represent our world?

But first a few words concerning key concepts and methods used in this study. I make no distinction in using the terms postmodern, postmodernism, or postmodernity, although numerous books have been written that do so.² My only interest in these terms is to identify and map some 60 texts, which is all I could find on the topic. By presenting the postmodernity debate in comparative education and its related discourse as an ensemble of textual relations, I hope to avoid giving the appearance of dualism and a binary struggle of opposites. On the contrary, I view all positions in the field as interrelated and perhaps best understood as an intertextual space that allows the negotiation of meanings and values.

In order to type and map, I must first enter into the texts and uncover how reality is seen (i.e., ontology), on what historical rules or codes truth claims are based (i.e., genealogy), and how the narrative framing process chosen produces a perspective, or narrative of transmission (i.e., narratology). In choosing narrative as a thematic frame, I seek to highlight specific dimensions of texts in the debate, while acknowledging that some aspects of the text are foregrounded at the expense of others.

Accordingly, my reading can only be understood in light of the possible heterogeneity of each text. Readings by others, including the authors themselves, would most likely produce different interpretations and mappings. Sharing and critiquing our interpretive and cartographic collaborations will help us to better know ourselves, others, and the world we jointly construct. The point to remember here is that my purpose is to read and interpret written and figural texts, not authors. This requires that, to the extent possible, texts be allowed to speak for themselves, to tell, with the use of quotes, their own stories.

I have always understood the postmodern condition as ironic sensibility, as a growing reflexive awareness, as an increasing consciousness of self, space, and multiplicity. Where the Enlightenment project has typically used reason and science in efforts to make the strange normal, advocates of the anti-Enlightenment,³ and most recently the postmodernists, have sought to render the familiar strange, or uncertain. This brings to mind the earlier contrast of Apollonian harmony and rationality and Dionysian decentering and deconstruction found in classical thought. The specific theses of postmodernist advocates, that is, the present-day Dionysians, tend to focus on what they have seen as the false certainties of modernity since the 1960s. Perhaps we might take note of five postmodern theses in particular.⁴ Foremost is a rejection of the Enlightenment foundations found in the grand narratives of progress, emancipation, and reason. These metanarratives are viewed as “terror”, silencing the small narratives, or in Blake’s terms, the minutely organized particulars of the Other.

A second thesis is the rejection of universal or hegemonic knowledge, any a priori privileging of a given regime of truth (i.e., functionalism, Marxism, postmodernism, or the like), and the need for a critical antihegemonic pluralism in social inquiry. A third thesis critiques attempts to adjudicate between competing cognitive and theoretical claims from a position of assumed or usurped privilege. Rather, postmodern texts see all knowledge claims to be problematic. The idea of universal unsituated knowledge that can set us free is seen to be a naive, if perhaps well-intentioned, self-delusion. Feminist texts, in their rejection of patriarchal truth claims, add the notion of a heterogeneous self to the postmodernist’s critique. In total contrast to the Cartesian autonomous actor found in modernity texts, identity in the postmodern era is seen to be mutable and contextually variable. Bodies are also seen as a contested terrain upon which to think differently about who we are and who we might become.

A fourth thesis argued in postmodern texts attacks Eurocentrism and seeks to open knowledge practice to postcolonial experiences and to non-Western cultural codes and interpretations. The fifth thesis argues for a shift in research from time to space, from facts to interpretations, from grounded positions to narrative readings, and from testing propositions to mapping difference.

Perhaps the single most important characteristic of postmodern sensibility is an ontological shift from an essentialist view of one fixed reality, that is, reason as the controlling principle of the universe, to an antiessentialist view where reality constructs are seen to resist closure and where multiple and diverse truth claims become part of a continuous agonistic, or contested, struggle.

The central question of social change in the larger postmodernism debate is also at issue in the more recent debate in comparative education. That is, do contemporary

developments – as postmodernists are prone to argue – mark a movement toward a distinct new form of social conditions characterized by nonmechanical yet complex relations that “appear as a space of chaos and chronic indeterminacy, a territory subjected to rival and contradictory meaning bestowing claims and hence perpetually ambivalent” (Bauman, 1992, p. 193)⁵ Or, in contrast, as neomodernist texts are prone to argue, are contemporary developments best viewed as rational processes internal to the development of a global and reflexive “late modernity”⁶

Before examining illustrative texts constructing positions in this debate, we might first note some foreshadowing of these exchanges during the earlier paradigm wars. In the 1977 “State of the Art” issue of the *Comparative Education Review*, edited by Andreas Kazamias and Carl Schwartz, for example, the cover pictures a broken house of knowledge, signifying, in my reading, the conflicted state of the field at that time (see Figure 1). Yet, note that the perplexed egghead professor remains whole and apart, a senior male in ivy league attire. This image suggests a material world in structural disarray, and it seems to question whether the power of rational professorial thought (i.e., theory) can rebuild the field’s foundation.

Fig. 1. A late modernist cartoon portraying the once solid structure of comparative education after the paradigm wars of the 1970s and structural deconstruction. The question seems to arise regarding how we are to retain our modern identity yet deal with the crisis.

Source: *Comparative Education Review*, 21 (June/October 1977): Cover

In a contribution to this special issue, I proposed (see Table 1) that comparative educators make a spatial turn and become more reflexive practitioners. I sought “to stimulate greater awareness of how individual views of social reality and social change tend to channel and filter perceptions and to look at alternative possibilities for representing educational change potentials and constraints. To this end, I delineated the total range of theoretical perspectives that had been used to support educational reform strategies and to suggest how individual choice behaviors follow from basic philosophical, ideological, and experimental orientations to perceived social reality” (Paulston, 1977). For the first time a phenomenological – albeit conflicted and static – portrait of how some 320 international texts constructed multiple educational reform realities appeared in a comparative education journal. In contrast, C. Arnold Anderson, looking back to 1950, argued in this special issue for a continued orthodoxy of high modernity. To quote this founding father of the Comparative and International Education Society (CIES), “I continue to insist that traditional social science disciplines should remain the foundations for work in this field” (Anderson, 1977). He advocated constructing theoretical models and formulating sound nomothetic conclusions, and he suggested avoiding fashionable ideologies and their semantics, clichés, and novelties. He advised comparative and international educators to produce solid scholarship by avoiding anthropology and ethnomethodology and embracing sociology and economics. In conclusion, Anderson offered guarded optimism for continued progress in CIES, but only if the field “avoids weary new panaceas” and works harder at the “identification of functional equivalents for the basic structures and functions of educational systems” (Anderson, 1977, p. 416).

My contribution focused on the space of texts in the literary construction of national educational reform debates and used what Foucault has called a genealogical approach to pattern texts as theoretical windows opening to multiple realities. Anderson’s text, in contrast, argued for an orthodoxy of nomothetic research capable of generating hypotheses, covering laws, and following modernization theory based on the primacy of autonomous, professional actors measuring the way things really are. Editors Andreas Kaza-mias and Karl Schwartz stake out a third and more pragmatic position somewhere between my hermeneutical interpretivism and Anderson’s patriarchal logocentrism. While firmly grounded in a realist ontology, the two editors chart a road ahead for the increasingly disputatious field of comparative education with their sensible call for a greater openness to cultural and critical approaches (my preference), for increased attention to pedagogical practice and teacher education (their preference), and for a view that sees social science (Anderson’s preference) as “pluralistic, modest and open” (Kazamias & Schwartz, 1977, pp. 175–176).

Today, some 22 years later, in our more heterogeneous time, it is possible with exegetic analysis to identify at least five knowledge communities in comparative education discourse that are more or less favorable to, if not proponents of, postmodernist views. These are the sites of (1) postmodernist deconstructions, (2) radical alterity, (3) semiotic society, (4) reflexive practitioner, and (5) social cartography. All five tend to locate the emergence of postmodernism after the 1970s as a periodizing concept and, accordingly, as external to modernity. Communities defending the grand narratives of modernity, in contrast, while they may acknowledge the postmodernist

Table 1. Relations between theories of social and educational change/“reform”

Illustrative linked assumptions concerning educational-change potentials and processes				
Social change paradigms and theories	Concerning preconditions for educational change	Concerning rationales for educational change	Concerning scope and process of educational change	Concerning major outcomes sought
Equilibrium theories: Evolutionary	State of evolutionary readiness	Pressure to move to a higher evolutionary stage required to support “national modernization” efforts	Incremental and adaptive; “natural history” approach	New stage of institutional evolutionary adaptation
Neo-evolutionary	Satisfactory completion of earlier stages		“Institution building” using Western models and technical assistance	New “higher” state of education and social differentiation/ specialization
Structural-functionalalist	Altered functional and structural requisites	Social system need provoking an educational response; exogenous threats	Incremental adjustment of existing institutions, occasionally major	Continued “homeostasis” or “moving” equilibrium; “human capital” and national “development”
Systems	Technical expertise in “systems management.” “Rational decision making” and “needs assessment”	Need for greater efficiency in system’s operation and goal achievement, i.e., response to a system “malfunction”	Innovative “problem solving” in existing systems, i.e., “Research & Development approach”	Improved “efficiency” regarding costs/ benefits; adoption of innovations
Conflict theories: Marxian	Elite’s awareness of need for change; or shift of power to socialist rulers and educational reformers	To adjust correspondence between social relations of production and social relations of schooling	Adjustive incremental following social mutations or radical restructuring with Marxist predominance	Formation of integrated workers, i.e., the new “Socialist Man”
Neo-Marxian	Increased political power and political awareness of oppressed groups	Demands for social justice and social equality	Large-scale national reforms through “democratic” institutions and processes	Eliminate “educational privilege” and “elitism”; create a more equalitarian society
Cultural revitalization	Rise of a collective effort to revive or create “a new culture.” Social tolerance for “deviant” normative movements and their educational programs	Rejection of conventional schooling as forced acculturation. Education needed to support advance toward movement goals	Creation of alternative schools or educational settings. If movement captures polity, radical change in national educational ideology and structure	Inculcate new normative system. Meet movement’s recruitment, training, and solidarity needs

(continued)

Table 1. (continued)

Illustrative linked assumptions concerning educational-change potentials and processes			
Anarchistic Utopian	Creation of supportive settings; growth of critical consciousness; social pluralism	Free man from institutional and social constraints. Enhance creativity need for “life-long learning”	Isolated “freeing up” of existing programs and institutions, or create new learning modes and settings, i.e., a “learning society”
			Self-renewal and participation. Local control of resources and community; elimination of exploitation and alienation

Note: The table presents a phenomenological comparison of how the international literature may be seen to construct national educational and social change/reform perspectives.

critique, tend to situate, as with Jürgen Habermas, the postmodern debate as internal to and only comprehensible in terms of the notion of late modernity. In my close reading of the 60 or so texts selected, four modernist genres or positions in the debate emerged: (1) metanarratives of reason, emancipation, and progress; (2) rational actor gaming; (3) critical modernist appropriations; and (4) reflexive modernity adaptations. These sites can be characterized, mapped, and compared according to how they choose to understand reality and how they problematize practice. These differences are represented in Figure 2, where we now turn our attention to the left, or postmodernism side, of the debate field.

Postmodernist Deconstructions

With the publication of his presidential address in 1991, Val Rust opened CIES discourse to the debate on postmodern ideas, a far-ranging controversy that has energized and destabilized much of intellectual life in the academy since the 1970s. Rust introduced deconstructivist arguments of the French poststructuralists Jacques Derrida, Michel Foucault, and Jean Francois Lyotard, ideas that reject the basic language and realist assumptions of the modern age. Arguing that the comparative education community has played almost no role in this discussion, Rust selected four aspects of postmodernism that he considered to be crucial for a postmodern understanding of our field today: (1) the critique of the totalitarian nature of metanarratives; (2) recognition of the problems of the Other; (3) recognition of the development, through technology, of an information society; and (4) an opening to new possibilities for art and aesthetics in everyday life (see Rust, 1991).

While Rust presents a compelling case for the utility of postmodern ideas in our era, his analysis remains strongly realist, even melioristic: “We comparative educators must discuss the opportunities of the incipient age. ... We must define more clearly the metanarratives that have driven our field ... we must engage in the critical task of disassembling those narratives because they define what comparativists find acceptable ... we must increase our attention to small narratives ... we must learn to balance high and popular culture” (Rust, 1991, 625–626).

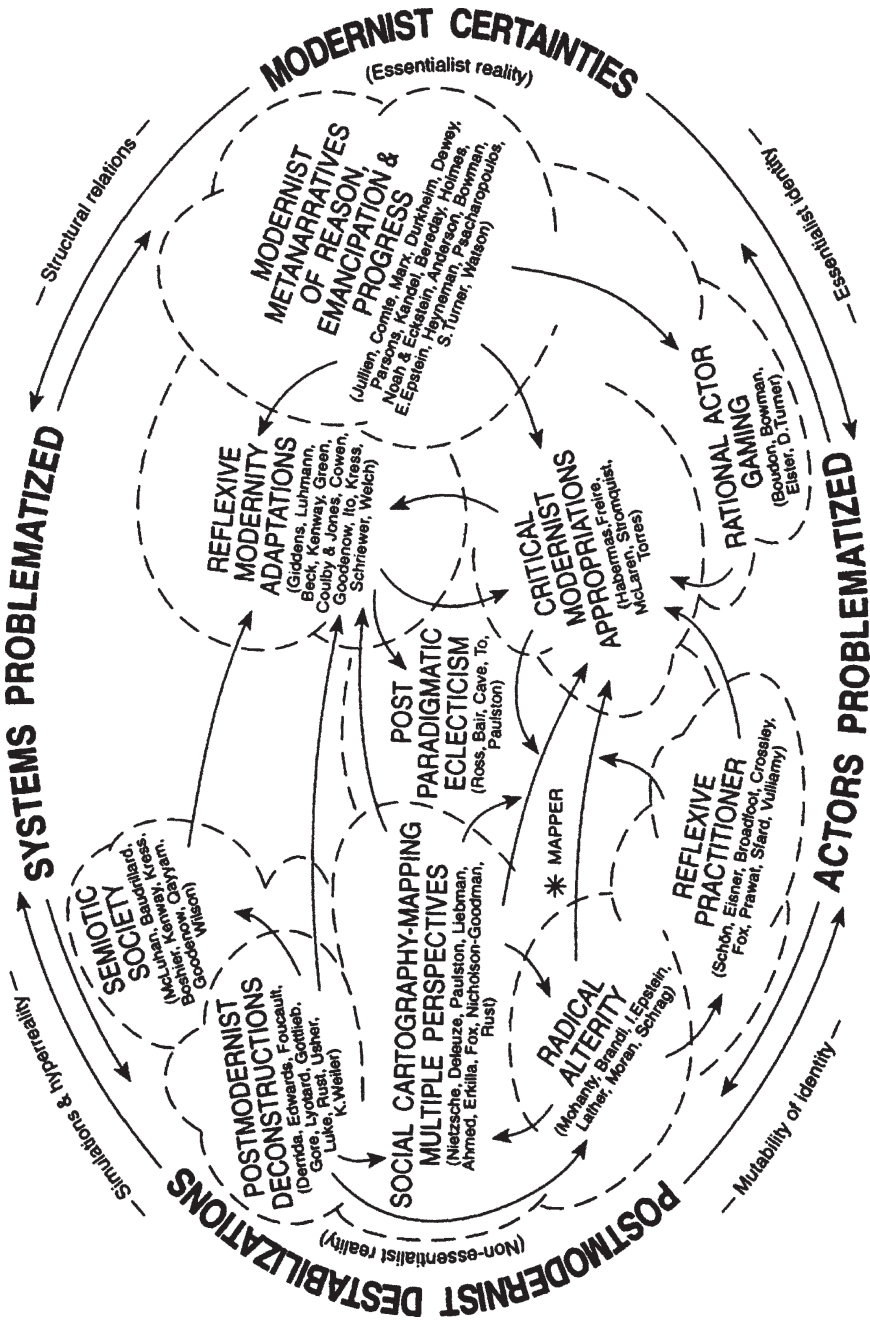

Fig. 2. A metaphorical mapping of knowledge positions constructing the postmodernity debate in comparative education (and related) discourse. In this open intertextual field, arrows suggest intellectual flows and proper names refer not to authors, but to illustrative texts cited in the paper and juxtaposed above. In contrast to Utopias (i.e., sites with no real place) much favored by modernist texts, this figure draws inspiration from Michel Foucault's notion of "heterotopias". These are the simultaneously mythic and real spaces of contested everyday life. Postmodernist texts favor heterotopias, as above, because they are "capable of juxtaposing in a single real place several spaces, several sites that are in themselves incompatible". (see Foucault & Miskowiec, 1986, p. 25)

As Rust's text demonstrates, letting go of modernity's language, let alone its essentialist and instrumental vision, is more easily advocated than achieved. Despite the contradictions between his text and his message, Rust's pioneering call to move away from a universal belief system toward a plurality of belief systems remains timely and exciting. Unfortunately, it evoked little if any response in CIES discourse until 1994 when Liebman and I used Rust's critique to support our invitation to a postmodern social cartography (Paulston & Liebman, 1994).⁷

In contrast to the certainty of Rust's text about the instrumental utility of postmodern ideas, the British scholars Robin Usher and Richard Edwards, in their 1994 text, advocate a more ludic or playful approach so as better to avoid creating the monster of a new postmodern metanarrative. To quote their text: "Our attitude to the postmodern is ambivalent. We agree that to be consistently postmodern, one should never call oneself a postmodern. There is a self-referential irony about this which we find lucidly apt in encapsulating our relationships as authors to this text. At the least, we ...have let the postmodern 'speak' through those texts [that] exemplify it" (Usher & Edwards, 1994).

Building on Rust's earlier manifesto, Usher and Edwards problematize and deconstruct the very notion of emancipation in the project of modernity to show what they see as its oppressive assumptions and consequences, particularly in the field of education. In this, they side with Jacques Derrida, in a desire to dissolve binary oppositions, to argue that education like power is neither inherently repressive nor liberatory, but perhaps both – or neither.

Here, there is no Hegelian synthesis where opposition can be transcended by correct ideas or a more logical argument. Rather, they see, as did Friedrich Nietzsche, a continual and unresolvable tension and struggle of perspectives. Given this scenario, Usher and Edwards argue for an education of resistance to disrupt metanarrative power. Or to quote their accessible text:

[I]t is in disrupting the exercise of power rather than in seeking to overcome it, that resistance can take form. The postmodern moment can enable us to transgress the boundaries of modernity rather than be contained within them. Resistance and transgressions, rather than emancipation, signify the possibilities for challenging dominant forms of power. It is analogous to Gramsci's war of maneuver rather than the war of attrition. And it is a war without end, a constant refusal of mastery, and of being mastered. (Usher & Edwards, 1994, p. 224)

In this, they share James Whitson's contention that the postmodern is perhaps best seen as an attempt at the antihegemonic without being counterhegemonic and thus risking incorporation as a relatively harmless rhetoric – as with much of critical pedagogy – into the dominant structure of control.⁸

Radical Alterity

The radical alterity battalions of the postmodernist forces apply Derriderian and subalterian ideas of the Other and seek to decenter and topple modernist control structures (i.e., hierarchy and patriarchy) with new possibilities opened by nonessentialist

notions of body and identity. Where modernist texts see science, morality, and art as stubbornly differentiated, advocates of a radical alterity see the self after postmodernity as both a construct of multiple forms of speech, diverse language games, and variegated narratives, and as action-oriented and self-defined by the ways in which it communicates. As Calvin Schrag puts it, the self after postmodernity is open to understanding through its discourse, its actions, its being together in community, and its experience of transcendence. In contrast, “the modernist grammars of unity, totality, identity, sameness, and consensus find little employment in postmodernist thinking” (Schrag, 1997).⁹ Instead, texts of the radical alterity community take up Lyotard’s warning that forced consensus does violence to the free play of language games and that our new interpretive categories of heterogeneity, multiplicity, diversity, difference, and dissensus are now available to interrogate and deconstruct modernist views of the autonomous Cartesian self (as represented by the professor in Figure 1) along with all of its traditional metaphysics and epistemological games.

Radical alterity texts are, understandably, most often found in the discourse of ethnic and gender movements seeking to oppose the hierarchies and exclusions of modernity. These are often angry texts seeking to shock, challenge, and defy. I have found only three examples in our field’s journals. Perhaps the best is a 1994 book review by Diana Brandi, then a doctoral student at the University of Pittsburgh, which appeared in the *Comparative Education Review*. Brandi’s text, in my reading, is first and foremost a personal attack on the book’s three senior author/editors, well-known and respected advocates of emancipatory modernity. She characterizes their representations of comparative education as it has emerged in the 1990s as a rehash of Marxist, functionalist, and structural functionalist perspectives. She finds this uniformity of content, perspective, and analysis not only troubling, but also puzzling. She claims that the chapters lack diversity, are self-referential, and lack a rich range of theoretical choices and multidisciplinary approaches, and that the book’s structuralist orthodoxy precludes any critical reflection on whose views the research reflects or how comparative education can support transformative change for a more humane world (Brandi, 1994).¹⁰

Brandi concludes that the central emerging issue for comparative education in the 1990s, and an issue the book virtually ignores, is the need to challenge the dominant hierarchies that continue to marginalize and silence the greater proportion of humankind. She contends the editors neglected more pluralistic discourses that challenge international development education and its service to structural adjustment, to militarism, and to the structural violence now being critically analyzed in other fields and disciplines. Here Brandi also challenges our field to open space for voices of the Other, antiessentialist voices that will attack and reject our modernist certainties of order and progress, if not of emancipation.

One year later, Irving Epstein, in a more conciliatory vein, also argued the desirability of realigning comparative studies from the seemingly innocent practice and critique of educational planning and policy to an opening up of space for cultural studies of contested local knowledge, of ethnicity, gender, disability, and the body. These issues of the Other are, Epstein complains, rarely addressed in comparative education discourse, despite a proliferation of just such studies in the academy after the 1980s (Epstein, 1995).¹¹

Semiotic Society

The semiotic society perspective builds upon ideas of Canadian Marshall McLuhan and Frenchman Jean Baudrillard. In his pioneering 1964 study, *Understanding Media*, McLuhan interpreted modernity as a process of differentiation, as a virtual explosion of commodification, industrialization, mechanization, and market relations. These differentiations produce “hot” media. In contrast, television, as a “cool” medium, is a site of implosion of all boundaries, regions, and distinctions between high and low culture (i.e., “the new global village”), between appearance and reality, and between the binary oppositions maintained by traditional modernist philosophy and modernization theory (McLuhan, 1964).

After first rejecting McLuhan’s thesis during his neo-Marxist phase, Baudrillard has more recently accepted and extended McLuhan’s “implosion of meaning” argument. Baudrillard’s text now argues that the seemingly endless proliferation of signs and information obliterates meaning through neutralizing and dissolving all content. This leads to both a collapse of meaning and the destruction of distinctions between media and reality, creating what he terms a hyperreality. In Baudrillard’s most recent texts, political economy, media, and cybernetics are seen to coalesce to produce a semiotic society far beyond the stage of capitalism described by Marxism. This is the time of postmodernity in which simulation models come to constitute the world and finally devour representation. Society thus is seen to move from a capitalist productivist orientation to a neocapitalist cybernetic order that aims at total control. Much like in television programs, models and codes come to constitute everyday life and social relations (see Poster, 1988). As in Brandi’s text, Baudrillard’s analysis sees a society subject to growing cybernetic control, where critiques that claim to be oppositional, outside, or threatening to the system become patterned into a society of simulations (i.e., copies without originals) as mere alibis that only further enhance social control.

Disneyland is Baudrillard’s prime example of a hyperreality, that is, not the unreal but the more-than-real. In such a universe, there are no explosive contradictions, crises, or even oppositions because everything is designed and controlled. There is no reality, or even potentiality, in the name of which oppressive phenomena can be criticized and transformed because there is nothing behind the flow of signs, codes, and simulacra. In this nightmare hyperreal society, not even social critique or critical art are possible. For Baudrillard, “a cool universe of digitality ... has absorbed the world of metaphor and metonymy. The principle of simulation wins out over the reality principle of pleasure.”¹² This is Baudrillard’s unsettling fantasy world, and it presents an extreme form of postmodern nihilism.

In a recent special issue on postmodernity and comparative education – the first in our field – in the British journal *Comparative Education*, three texts (none of which cite Baudrillard) address a number of more practical aspects of the so-called cyberspace challenge. Ronald Goodenow examines how, the emergence of global communications networks, most notably the information superhighway, have created a new world of cyberspace. Issues of ownership and power, of how knowledge and services are defined and distributed, and of how technological have-nots gain access to networks now become major policy issues. Goodenow also stresses that educators will need to

become more interdisciplinary and knowledgeable of trends and debates in many areas (Goodenow, 1996).

Gunther Kress's text more specifically asks how the constitutive principles of postmodernity, for example, diversity, multiple reality, alterity, and paralogy, suggest the need for new representational approaches. Today our theories of meaning making, or semiosis, are largely grounded in late nineteenth-century notions of stable social systems (e.g., Emile Durkheim and Talcott Parsons), stable signs communicating stable meanings (e.g., Ferdinand de Saussure), and assumptions of an abstract reified formal appearance (e.g., C. Arnold Anderson). But now postindustrial societies are struggling to construct new forms of information-based economies responsive to cultural difference, change, and innovation. Kress challenges comparative educators to join in the creation of new modes of thinking about meaning and how we might jointly make and remake our systems of representation "in productive interaction with multiple forms of difference" (Kress, 1996, quote on p. 196). But one wonders how Kress would interact with Baudrillard's destabilizing notions of hyperreality.

Jane Kenway's text sounds a cautionary note in warning that educators and students need to question the cyberspace claims of both Utopians (i.e., the likes of Bill Gates) and Dystopians (i.e., the likes of Baudrillard). While granting the inevitability of the digital revolution, she draws attention to the way we produce and consume the new technologies and to associated issues of politics and justice. Teaching students about the consequences of technology is, she notes, perhaps even more important than teaching them how to operate the machines (see Kenway, 1996). Mary Wilson and colleagues do exactly this in a later political economy study of the World Wide Web. Their text contends that an overwhelming American presence on the Web renders "the American perspective" the norm, or center, while the rest of the world becomes periphery. They argue that cyberspace, with its lack of boundaries and connection to geographical place, conceals US dominance, and that astute educators need to recognize these factors and work to circumvent them (Wilson, Qayyam, & Boskier, 1999).

Reflexive Practitioner

The two remaining camps favorable to a postmodern reading of our time and our field are the reflexive practitioner and the social cartography textual genres. Both favor a hermeneutics of affirmation, and both are closely linked with the burgeoning qualitative research tradition in education. The reflexive practitioner genre especially has deep roots in Western humanism and in the Romantic Movement. In education, it has resisted scientific and technological efforts to objectify and commodify the world. During the paradigm wars of the 1970s and 1980s, the strongly humanistic reflexive perspective successfully defended *Verstehen*, or insight, as a key concept and goal for individual learning and knowledge work. An influential text of that time legitimating reflexive approaches in education is Donald Schon's *The Reflective Practitioner* (Schon, 1983).¹³ Schon explored the crisis of confidence in professional knowledge and advocated a solution of moving from technical rationality to reflection in action. In comparative education, I made the same argument

seeking to recognize the value of both imagination and technological reason in 1990, but to seemingly little effect (Paulston, 1990).

Today, postmodern attacks on modernist ways of knowing grounded in essentialist views of reality have helped to open a larger space for reflexive perspectives. For many, a reflexive perspective view of actors and systems offers a reasonable alternative to either the demanding perspective of radical postmodernity with its hermeneutics of despair or the perspective of a nostalgic, rule-bound modernity. For example, Patricia Broadfoot of the University of Bristol chooses this ontological middle ground in her foreword to *Qualitative Educational Research in Developing Countries*. Her introduction recognizes both postmodern influences, that is, a plurality of belief systems, a recognition of multiple realities, and the influence of culture and context, yet retains a clear concern for social scientific research and “the progress to which it will lead” (Broadfoot, 1997). Variations on this recognition of multiple viewpoints and diverse interests by scholars in the eclectic center are also becoming increasingly evident in the educational research literature. Elliot Eisner, for example, advocates a multiplicity in data representations that welcomes artistic, linguistic, and visual alternatives along with more traditional positivistic choices. But he also warns that an interpretive multiple perspectives approach may introduce dangerous ambiguity and a potential backlash:

A genre of work can stand alone without an interpretive context when those reading, seeing, or hearing it bring that context with them. When they do not they are likely to be lost. Few people like to be lost. When the terrain is new, we need context. We also need to be sure ...that we are not substituting novelty and cleverness for substance. In other words, we need to be our own toughest critics. (Eisner, 1997, quote on p. 9)¹⁴

Social Cartography

Texts clustered in the social cartography genre also share a number of defining characteristics, perhaps best captured by Foucault’s notion of heterotopia. In contrast to the totalizing utopic (i.e., no-place) space of modernity, heterotopic spaces are the simultaneously mythic and real spaces of everyday life capable of juxtaposing in a single place a great variety of different sites which in themselves may be incompatible. As William Blake noted, modernist texts favor idealistic rational Utopias of general good. In contrast, postmodernist texts favor heterotopias of situated difference and local knowledge. Figure 2 above illustrates just such a heterotopic mapping of difference. Here, within an intertextual field, all viewpoints producing a text in the CIES postmodernity debate find space and relation to other similar or totally different ways of seeing. As such, this tangled and interconnected mapping, or Deleuzian rhizome, of knowledge positions and relations can be seen as a metaphor of the debate, as a heuristic approach, and as a real site of parody and postmodern process. It can also be seen as a useful new spatial tool specifically created to give visual form to the growing complexity of knowledge work today. Where Pablo Picasso with analytical cubism made it

possible to represent many sides of an object at the same time, social cartography also creates something in the very act of depiction. This is not simply a fragile synthesis, but a new way of looking at the world and, equivalently, a new aspect of the world at which to look (Foucault & Miskowiec, 1986).¹⁵

The ideas behind heterotopic mappings of perspectival difference began to take form in my paper "Comparing Ways of Knowing across Inquiry Communities", presented at the CIES annual meeting in Pittsburgh in 1991. A number of doctoral students at the University of Pittsburgh then joined the project, and together we worked to create a social cartography able to visualize and pattern multiplicity, be it multiple perspectives, genres, arguments, or dreams. In this heuristic, the field is also defined by the outlying positions. In modern, positivistic representations, in contrast, the opposite is true, that is, the intention is to plot a central tendency where outliers, such as the Other, simply disappear.

On the surface, discourse mapping appears to be a fairly simple, if demanding, process of reading and juxtaposing ways of seeing in texts. I proceed in the following "cookbook" fashion, much to the horror of my postmodernist colleagues: (1) Choose the issue or debate to be mapped. (2) Select the widest range possible of texts that construct this debate and, with close reading, translate their defining rhetorical characteristics, ideas, and worldviews. (3) Identify the range of positions in the intertextual mix. In Figure 2, for example, these positions are presented on the horizontal axis as the onto-logical poles of "postmodernist destabilizations" and "modernist certainties". On the vertical axis, the poles chosen are "actors problematized" and "systems problematized". (4) Identify the textual communities that share a way of seeing and communicating reality; locate them within their space and interrelate communities of vision with space, lines, arcs, arrows, or the like. While resisting all modernist urges to box in or lay down a grid, locate coordinates outside the field to allow for a less restricted space of intersubjectivity, movement, and choice than provided by Table 1. (5) Field test the map with the individuals or knowledge communities involved. Share the conflicting interpretations and remap as desired.

As an oppositional postmodern strategy, social cartography translates across interacting sites of material inscriptions, avoiding the idealist totalities of Utopian modernity. This process of mapping and translating seeks to open up meanings, to uncover limits within cultural fields, and to highlight reactionary attempts to seal borders and prohibit translations. In this lies postmodern mapping's contribution to an antihegemonic critique.

Social mapping may also be seen as an emergent methodology from within the hermeneutic mode of inquiry that acknowledges that worlds are constructed and interpreted both objectively and subjectively, that is, that within fields of study or sites of knowledge, a dialogue is always taking place that involves meaning systems that are illusive. These meaning systems are formed by those who elaborate them, and an open, intertextual field is created by the dialogue. For this reason, the comparative researcher and the reader alike serve as translators within this mode of interpretive inquiry. But, as Eisner warns, the researcher now has a threefold obligation to explicate what point of view is being utilized in the study, to disclose the interrelations of the field or site itself, and to convey something of the personal or professional experiences that have led her or him to choose a particular point of view.

As our social cartography project at the University of Pittsburgh took form, several dissertations and books mapped situated areas of the theoretical and operational landscapes of comparative and international education. Martin Liebman's thesis, for example, expands our understanding of metaphorical analysis in comparative method (Liebman, 1994).¹⁶ Zebun Ahmed's study maps how village women in rural Bangladesh view their nonformal educational experiences with Western nongovernmental organizations (Ahmed, 1997).¹⁷ Kristiina Erkkilä maps positions in the entrepreneurial education debates in the United States, the United Kingdom, and Finland (Erkkilä, 2000). Katsuhisa Ito is currently critiquing the project from a human geography viewpoint, Michel Rakatomanana is mapping the debate on new information technologies and educational development, and Mina O'Dowd is mapping how multiple knowledge perspectives can be seen to construct a longitudinal research study in Sweden (see Katsuhisa, 1998; Rakotomanana, 1999; Gorostiaga, 1999; O'Dowd, 1999). In our 1996 project book, *Social Cartography* (Paulston, 1996),¹⁸ a number of leading US, Canadian, and international scholars collaborated to demonstrate mapping applications in research practice (i.e., Christine Fox, Esther Gottlieb, Thomas Muat, Val Rust, Nelly Stromquist, among others) or to critique and counterargue the book's contention that social mapping is a useful tool for comparative analysis today. Carlos Torres and John Beverley, for example, propose critical modernist and subaltern studies positions that are antithetical to social mapping. Patti Lather interrogates mapping from a radical feminist view, and Joseph Seppi from a traditional positivist position. If, indeed, all knowledge claims are now problematic, then opposing views will need to be consciously incorporated and juxtaposed in any credible argument or analysis. As we shall see in the following section on modernist orthodoxy, this will be a hard pill for many true believers to swallow.

Modernist Metanarratives

On the far-right side of Figure 2, I pattern illustrative modernist texts in comparative education discourse that oppose, in one way or another, the postmodern challenge within three broad areas: (1) Utopian texts that largely reject postmodernist ideas and explicitly counterattack to defend a core modernist metanarrative (i.e., universal reason, or progress); (2) critical pedagogy texts that seek to preserve the modernist metanarrative of emancipation with the selective appropriation of postmodernist and/or feminist ideas, and (3) performativity texts that seek to elaborate a new narrative of reflexive modernity for our time of risk (i.e., what they call "late modernity") when the old modernist master stories of certainty and technological progress have less and less credibility.

In the counterattack category, Erwin Epstein's chapter "The Problematic Meaning of Comparison in Comparative Education" presents a spirited defense of totalizing modernist reason and a rejection of what he calls the "challenge of relativism" (Epstein, 1988).¹⁹ His text, however, does not recognize postmodernism and its complaints, although that debate was raging then (1988) at a feverish pitch in the social sciences and the humanities. Instead, his targets are phenomenological and ethnomethodological

additions to the literature and especially my study (summarized in Table 1). These two perspectives share a nonessentialist understanding of ontology with postmodernism, and they view reality as a variously situated construct. In a masterly comparison of what he claims to be incomparable, Epstein's text contrasts examples of relativist (i.e., cultural interpretation and phenomenological readings) and realist (i.e., positivist theory-development) perspectives in comparative education. He rightly concludes that they are incommensurable in their assumptions, procedures, and aims. His text fails, however, to address the core difference of ontology or how reality is variously seen. His either/or approach, while seemingly evenhanded, has a strong essentialist bias:

Generalizations across societal boundaries define ... the comparative method for positivists. For cultural relativists, comparison is a process of observing the distinctiveness of individual cultures. These positions are to be sure incompatible, but they both rest on a procedure that requires multicultural analysis and therefore can be said to employ some concept of "comparison". This is not so for phenomenological approaches, which carry relativism to a nihilistic extreme that allows only for interpretation of highly idiosyncratic interactions within severely limited contextual boundaries. Within such parameters, not even culture is sufficiently contextually delineated to constitute a basis for analysis. (Epstein, 1988, p. 6)

Thus, from an extravagant logical positivist viewpoint that in Pascal's term "will admit only reason," Epstein's text contends that one who chooses a phenomenological approach (as in my Table 1 and Figure 2) cannot be a comparativist, and he argues that the challenge of relativism is a threat not only to the metanarrative of reason, but also to the viability of comparative education as a field. "Only nomothetic explanations—or the discovery of underlying trends and patterns that account for whole classes of actions or events [i.e., covering laws] can support comparison capable of theory development and general laws" (Epstein, 1988, p. 22). Epstein's essentialist text is notable for its epistemological certainty and faith in the positivist story of social progress with the discovery of universal regularities—alas, as yet to be seen.

An anti-Enlightenment position might well counterargue Epstein and claim that only relativists can be comparativists because they alone are open to the indeterminacy of being. But that would be a modernist either/or argument. Postmodernists would open to all positions and, as illustrated in Figure 2, turn to a spatial representation of "the order of things" that moves us a bit beyond the limitations of opaque language. This would also be my choice, but I must leave it to the reader to assess the comparative utility of Figure 2 and Hayden White's claim that "the macroscopic configuration of formalized consciousness uncovered in language" might be translated into a spatial visual mode of representation (see White, 1978, quote on p. 239).²⁰

A more focused rejection of postmodern ideas, at least as they are present in our work on social mapping, can be found in Keith Watson's recent British Comparative and International Education Society (BCIES) presidential address and in his review of *Social Cartography*. These two texts warn the reader of the intellectual temptations of such dangerous postmodern ideas as pluralism, multiplicity, and uncertainty—or what

Watson erroneously disparages as “New Age Thinking”. His text sees postmodernist views as fatally flawed because they do not offer testable hypotheses, or criteria for decision-making, or parameters for interpretation. Such “wooly thinking” is, he complains, written by enthusiasts who are so excited by the novelty of what they are saying that they do not see the weaknesses. Yet, at the same time, he also makes the odd claim that “these overly enthusiastic postmodern cartographers are [only] putting into diagrammatic form what most sociologists . . . have always recognized” (Watson, 1998).²¹

But Watson’s text sees a flaw in heterotopic mapping more serious than intellectual excitement and enthusiasm. Watson warns that most administrators and aid agency officials may well see social cartography as yet one more example of “esoteric comparative education” that is irrelevant for them. While acknowledging that postmodern mapping can indeed represent the micronarratives of all the players, whether they hold power or are on the margins, his text dismisses the need for such knowledge, claiming that educational planners and policy-makers require only “hard data” for rational decision-making.²² Here the term hard data is repeated as a mantra and is not defined, nor are any data provided to support Watson’s exclusionist claims.

Watson’s text would seem to confuse the postmodern social cartography as practiced in Figure 2 with traditional scientific or mimetic modeling, where the image is assumed to reflect a positive reality that can be known empirically, or ideologically. But with our postmodern mapping of metaphors, the map, like the self, can also be portrayed as in a state of Dionysian dispersal that, as with Foucault’s notion of heterotopia, reconstitutes diversity as a provisional unity.

Rational Actor

The rational actor, or game-theory, position can be seen as a close relation of Anderson’s and Watson’s modernist metanarrative of progress. Here, texts seek to develop nomothetic models able to explain and predict economic and educational behavior in universal terms. Raymond Baudon divides these efforts into two types, that is, the “determinist” and “interactionist” (Baudon, 1982). Mary Jane Bowman’s model of 1984 (Bowman, 1984) is cited by David Turner to illustrate the former because it seeks to explain school attendance rates in terms of prior events and to support the discovery of uniform covering laws. Using an analysis of variance, a deterministic approach would suggest that every individual is driven by “the programming that the social structure imposes on him” (Turner, 1988). In this, modernization and Marxist theories share the same certainty and reductionist view. But Turner’s text problematizes actors, not structures, and argues that the determinist model is simplistic and fails to recognize features of free will and capriciousness in human behavior. Social theories and ultimately social laws are, Turner contends, still attainable, but only with the use of an interactive model based on empirical studies of student risk-taking behavior. Only with the scientific study of individual agents and educational demand, and not just formal structures, Turner’s text argues, will progress in educational reform be made.

Critical Modernist

Texts choosing the critical modernist perspective characteristically maintain a strong commitment to the modernist metanarrative of emancipation while seeking to breathe new life and credibility into the Enlightenment project. They do so by selectively appropriating postmodern ideas from antiessentialist reality positions to shore up their own essentialist foundations. Clearly, this is a difficult – if not confused – task and requires a good deal of qualification and rationalization. A recent text by Peter McLaren presents a prime example of such ontological fancy footwork:

While I acknowledge the importance of recognizing the conceptual limits of Marxian analysis [i.e., Marxist universals] for reading certain aspects of the postmodern condition, I believe that the main pillars of Marxian analysis, remain intact, i.e., the primacy of economics and the identification of contradictions and antagonisms that follow the changing forces of capitalism. It is important that critical educators not lose sight of these foci [i.e., modernist foundations] in their move to incorporate [antifoundational] insights from ... postmodernism. (McLaren, 1994)²³

Here McLaren's text shares the yearning of positivists for certainty in the form of hard data: "[W]e need to be able to stipulate in specific contexts which effects are oppressive and which are productive of social transformation. I believe that to defend emancipation ... we must make certain that not all voices are celebrated" (McLaren, 1994, p. 338).²⁴ Where Erwin Epstein's counterattack excludes relativism as the enemy of Enlightenment reason and true comparison, McLaren's text would, like Watson's, silence the ideological Other. In order to avoid just this sort of silencing, I invited Carlos Torres to provide a concluding chapter for our *Social Cartography* book using a critical modernist perspective antithetical to the book's uncertainty thesis. This practice of incorporating oppositional views into intertextual constructions is seen by pluralists and postmodernists not as masochism, but as paralogy where science opens up from an Apollonian program of testing and verification for truth value to also include a Dionysian process of paralogical deconstruction and a recycling of all knowledge claims. In this way, we seek to create a spirited conversation and vouchsafe its continuation.²⁵ With mapping, as in Figure 2, Torres's self-privileging metanarrative claim is recognized and reinscribed into the intertextual field/map, not as a master narrative of "general good," but as another contending mininarrative, that is, as perhaps useful "minute particulars" to be assessed in practice.

Torres also recognizes the utility of postmodernist critiques of representation, but only when they avoid what he sees (but does not illustrate) as the pitfalls of extreme relativism and solipsism. Torres's text sees the greatest danger of postmodern views in their claim that language constructs reality. His text sees this postmodern shift from hard data and "correct" ideology to metaphor, multiple perspectives, and methodological pluralism as antithetical, even subversive, of the theoretical integrity of his privileged modernist metanarrative of emancipation. His text defensively calls for a linguistic hygiene, that is, that "metaphors ... should have no place in social sciences if

they substitute for social theorizing including metatheory (or epistemology), empirical theory and normative theory” (Torres, 1996).²⁶ Here, Torres’s text seems to be deeply suspicious of any but a scientific, analytical method whose goal is not the recovery and confirmation of its own ideological origins. While Torres, like McLaren, acknowledges that postmodern ideas may help to make Marxist class analysis less totalizing and deterministic, his text continues to demand a so-called reproduction of the concrete situation in conformance with his ontological choice of theoretical realism and his claims of a universal truth system.²⁷

Reflexive Modernity

Texts representing the reflexive modernity position share common origins with critical modernist texts. They have, however, been better able – at least superficially – to let go of fading modernist certainties and master narratives. They seek to survive the poststructuralist storms by selectively adapting useful interpretations, stories, and vocabulary from the postmodern literature and choosing the metaphors of late modernity and reflexive modernity.²⁸ Texts from this burgeoning community retain modernist notions of a unitary and ideal space of a society that is mapped onto the body of a population along with territorial claims of a nation state and a national educational system. At the same time, they seem to have lost all hope for certainty and selectively attempt to incorporate and adopt postmodern ideas of fragmentation, polymorphous identity, and discontinuous thought spaces (see, e.g. Welch, 1998).²⁹ In the West, and especially in Western Europe, the reflexive systems view recognizes a politics of voice and representation that often seeks to displace a welfare state held to be inefficient and paternalistic. Central to this view, and in marked contrast to the certainties of critical modernist texts, is the idea that to know how to act we need to know “what’s happening”. For this we need to develop a language and a space in which to engage our present willingness to let most, if not all, knowledge perspectives contend and compete.

In comparative education, this reflexive systems view is well illustrated by Robert Cowen’s recent text, where he claims that Lyotard’s 1979 analysis of the postmodern condition continues to offer the most accurate assessment of society – and of universities – as they move into “the post-industrial age and as culture moves into what is known as the postmodern age” (Cowen, 1996, quote on p. 247).^{30,31} Lyotard’s argument is that today knowledge is subject to “performativity,” or the optimization of system efficiency. Knowledge has become a technology, that is, a marketable commodity subject to performativity as well as truth tests. Cowen perceptively argues that these changes define a different kind of comparative education predicated not on the tired old modernist metanarratives of certainty, but on the recognition of a crisis of legitimacy. Where the modern comparative education of John Dewey and Talcott Parsons and colleagues focused largely on citizen preparation and equality of educational opportunity, in late-modern educational systems the strongest pairing is seen to be between the international economy and efforts to gird educational systems for global competition. Today, Cowen contends, we comparativists will need

to specify the patterns of muddle in specific national contexts of transition to late-modern education. [Today] the common sense categories of analysis – i.e., school management and finance, administrative structures, the curriculum, teacher education – are now dangerous. Even if we could deduce determined rules from them [as advocates of modernity would have us do] the rules would be a reading of the wrong world. (Cowen, 1996, p. 167)³¹

Coda

To conclude, Cowen cites Zygmunt Bauman's observation that we are no longer legislators, and that we should first look to our interpretations (Bauman, 1987). I can only concur and further suggest that as comparativists we are, from the look of things, also well positioned to become social cartographers, able to translate, map, and compare multiple perspectives on social and educational life. And as our intertextual traveling in this study suggests, while our collective work is becoming more postparadigmatic and eclectic, we are, as individuals, also aware of "sweet spots" or favored sites in knowledge work where we encounter more allies, resources for practice, and options for movement (Ross et al., 1992).³² At the same time, we are learning to recognize and include views of the Other, thus enlarging the scope of our vision and the diversity, or minute particulars, of our representations.

So is there, perhaps, something akin to a general good, writ small, to be found in the opportunities arising from comparative education practiced as comparative mappings of disparate world views? This is our challenge today, to understand William Blake's belief that truth is particular, not general, while we move beyond his either/or formulation into a more heterotopic space of critically reflexive understanding – as shown in Figure 2 – open to the essentialist texts of late modernity, to the antiessentialist texts of the postmodernists, and to all the texts that have yet to claim their agonistic spaces.³³

Notes

- 1 I thank Professor Roger Boshier and his students at the University of British Columbia who invited me to present a version of this paper as a keynote address at the Western Regional Meeting of the Comparative and International Education Society, June 1998. I also thank the three reviewers for their helpful comments.
- 2 For those interested in the intricacies of new social science ideas and terminology in education after modernity, see, among others, Buenfil-Burgos (1997, pp. 97–107); and English (1998, pp. 426–463). For an accessible introductory textbook on popular culture and the postmodern condition, see Anderson, *Reality Isn't What It Used To Be* (1990).
- 3 See Berlin (1980), esp. pp. 1–24. Berlin identifies the three central ideas of the anti-Enlightenment as (1) populism, or the view that people can realize themselves fully only when they belong to rooted groups or cultures; (2) expressionism, or the notion that all human works are above all voices speaking or forms of representation conveying a world view; and (3) pluralism, or the recognition of a potentially infinite variety of cultures, ways of seeing, and systems of values all equally incommensurable with one another, rendering logically incoherent the Enlightenment belief in a universally valid master narrative or ideal path to human progress and fulfillment. Berlin identifies leading exponents

- of the anti-Enlightenment as Niccolo Machiavelli, Giambattista Vico, William Blake, Johann Herder, Alexander Herzen, and others, including Georges Sorel and Friedrich Nietzsche.
- 4 A more detailed exposition may be found in Owen (1997, pp. 1–22). Owen suggests that postmodern “theory” seeks to shift the work of social science from theorizing truth claims to representing new social and intertextual terrains in constant flux. For a useful guide to exegetic textual analyses as “close reading,” see Francese (1997, pp. 107–154).
 - 5 Earlier, Foucault, perhaps anticipating the cyberspace revolution, argued that today there has indeed been a fundamental change of consciousness from time to space: “the great obsessive dread of the nineteenth century was history, with its themes of development and stagnation, crises and cycle, the accumulation of the past, the surplus of the dead. Our own era, on the other hand, seems to be that of space. We are in the age of the simultaneous, of juxtaposition, the near and the far, the side by side, and the scattered. A period when the world is putting itself to the test, not so much as a great way of life destined to grow in time but as a net that links points together and creates its own muddle [as in table 1 and figure 21. It might be said that certain ideological conflicts which underlie the controversies of our day take place between the pious descendants of time and tenacious inhabitants of space.” See Foucault and Miskowiec (1986).
 - 6 For useful discussions of the reflexive modernity – or late modernity – world view, see Beck, Giddens, and Lash (1994).
 - 7 Here the authors introduce social cartography to comparative educators as “a new and effective method for visually demonstrating the sensitivity of post modern influences for opening social dialogue, especially to those who have experienced disenfranchisement by modernism” (p. 232). Their social cartography text contends that spatial juxtaposition provides a new way to seek a more situated truth in a cyberspace era. Now truth is not necessarily grounded in measurable fact alone; it is also predicated on the acquisition of a generosity of vision composed of many truths, that is, what postmodern texts call a “multiplicity of witness” and a “democracy of perception”. By opening comparison in this way, postmodern social cartography helps actors move outward from subjective truth toward a reintegration of the self into a new social fabric/space composed of multiple voices and stories. This view is labeled “postmodern multiperspectivism” by Francese (n. 4 above) who advocates its utility as a safeguard against “any excessively strong, exclusionary reading of the past: the univocal truth that suffocates all others and quickly transmogrifies into reified myth” (p. 130).
 - 8 See James Whitson’s somewhat quixotic “Post-structuralist Pedagogy as a Counter-hegemonic Praxis” (1991). Texts advocating or applying a postmodern deconstruction perspective can also be found in Weiler (1996), Luke (1995), and others, including Gottlieb (1989).
 - 9 For the subaltern perspective, see, e.g., Mohanty (1991). For an application of the radical alterity perspective to probe the trope of space in feminist studies, see Spark (1996).
 - 10 Brandi claims that the book’s structuralist orthodoxy silences questions of how research reflects the views of those under consideration and whose voices and what questions direct the evolution of the field (p. 160). She also contends that the inclusion of feminist theories on structural adjustment and phenomenological studies of local perspectives would better help oppressed people improve their quality of life.
 - 11 In contrast to what Epstein’s text sees as my purported optimism for the field, I see my viewpoint more akin to Berlin’s curious combination of idealism and skepticism. Epstein’s text also makes an argument for measured skepticism in evaluating the field’s future possibilities. The problem, as Epstein sees it, is that limited understanding of self restricts the scope and possibility of knowledge work within the comparative education field. But is our lack of reflexive self-knowledge, our naivete, our bane? If so, could it not be viewed as an educational problem that might be treatable with heterotopic mapping? A third radical alterity example problematizing actors in comparative education texts can be found in Moran (1998). Moran compares two life histories, her own and that of Gail Paradise Kelly, with painful honesty and introspection. Her narrative account of one woman’s struggle with the rules of patriarchal modernity provides a valuable pioneering contribution to comparative education, to date a largely logocentric male discourse repelled by the very radical alterity sensibilities that construct Moran’s story.
 - 12 See the neo-Marxist critique of Baudrillard’s arguments in Kellner, *Jean Baudrillard: From Marxism to Postmodernism and Beyond* (1989). While Kellner seems to be fascinated with the brilliance and originality of Baudrillard’s ideas, he nevertheless sees him trapped by “the absence of a theory of

- agency and mediation [by] ... the impossibility of any sort of agent of political change ... by the metaphysical triumph of the object over the subject” (p. 216). And yet Kellner concludes “the appeal of Baudrillard’s thinking might suggest that we are [indeed] living in a transitional situation whereby new social conditions are putting into question the old orthodoxies and boundaries” (p. 217).
- 13 For a perceptive examination of different traditions in reflexive thought today, see Potter (1996). For two imaginative literary attempts to move beyond the tendency of most modern intellectual production to “state, qualify, and conclude,” see Ermath (1992), and Paulston and Plank (2000).
 - 14 Anna Sfard, in a related study, warns that the struggle for a conceptual unification of research is not a worthwhile endeavor and that too great a devotion to one particular metaphor can lead to theoretical distortion and undesirable practical consequences. Instead, she rejects Torres’s stricture (see n. 27 below) and advocates a discursive approach of “metaphorical mappings” and metaphorical pluralism for conceptual renewal and improved practice. See her study, “On two metaphors for learning and the dangers of choosing just one” (1998).
 - 15 (See n. 5 above). In making his shift from time to space in social analysis, Foucault graciously acknowledges his intellectual debt to Gilles Deleuze with the words “perhaps one day, this century will be known as Deleuzian” in his *Language, Counter-Memory, Practice* (1977, p. 76). For their original and fecund ideas on concepts seen as territory and on the necessity of cartographies as a strategy to examine discourse with spatial analysis, see Deleuze and Guattari (1980). For the cubism analogy, see Nehamas (1985). I thank Professor Eugenie Potter for pointing out this relationship.
 - 16 In postmodern mapping as in postmodern narrative, the effort at estrangement moves in two directions simultaneously: one magnifying the subjectivity of perception, the other diminishing any sense of mimetic connection between that subjectivity and the world that seemingly remains intact and apart. Liebman excels in producing this sense of estrangement as a distortion of scale and perception. In the words of Vladimir Nabokov, the objective is to find “a kind of delicate meeting place between imagination and knowledge, a point, arrived at by diminishing large things and enlarging small ones, that [like social mapping] is intrinsically artistic”. See Nabokov (1970).
 - 17 Ahmed demonstrates how a mapping of women’s stories from the margins can, indeed, provide valuable evaluative data for educational planners – if they will only look and listen.
 - 18 The interested reader is also directed to a companion project volume by Paulston, Leibman, and Nicholson-Goodman, *Mapping Multiple Perspectives: Research Reports of the University of Pittsburgh Social Cartography Project, 1993–1996* (1996).
 - 19 Variations on this metanarrative can be found in Psacharopoulos, “Comparative Education: From Theory to Practice” (1990, pp. 369–380) and Heyneman, “Quantity, Quality and Source” (1993, pp. 372–388).
 - 20 White concludes that the key to understanding Foucault’s method of “transcription” is to be found in how it is used to reveal the inner dynamics of the thought process by which a given representation of the world in words is grounded in poesis: “[T]o translate prose into poetry is Foucault’s purpose, and thus he is especially interested in showing how all systems of thought in the human sciences can be seen as little more than terminological formulations of poetic closures with the world of words, rather than with the things they purport to represent and explain” (p. 259).
 - 21 Watson echoes C. Arnold Anderson’s earlier modernization agenda for comparative education: “above all, the work undertaken should have purposeful reformist and practical goals and should be used to inform and advise governments” (p. 28). In his text, Watson offers by way of illustration two structural-functional figures, one of “the determinants of an educational system” (p. 22) and the other of “international influences that shape educational systems” (p. 27). However, it is not clear how these representations meet his criterion for “hard data,” especially the latter figure, which is coded using world systems ideology and presents a soft critique of international capitalism, in, for example, the “Role of Stock Markets, e.g., Tokyo’s Hang Seng” (p. 27). But as every Hong Kong schoolboy knows, the Hang Seng stock market is not in Tokyo, and even supposedly “hard data” may become a bit fuzzy now and then. The Nikkei is, in fact, Tokyo’s stock exchange.
 - 22 See also Keith Watson, reviews of *Mapping Multiple Perspectives* by Paulston, Leibman, and Nicholson-Goodman (1996); and *Social Cartography*, edited by Paulston (1998). While statistical analyses may indeed be useful in technical work, balanced educational assessment requires an alternative practice of formulating judgments not only on assigned numerical ratings, but also on the

- characteristics of performance in context. Watson's text sees useful knowledge from a rather narrow modernization theory viewpoint (i.e., articulated in simple, essentialist, and mechanistic terms). My view is broader and also welcomes a perspective that sees knowledge as individually and socially constructed and as reflected in particular contexts and discourses that can be mapped and discussed and remapped. See Delandshere and Petrosky (1998).
- 23 See also the related studies by Buder (1992) and Stromquist (1995). Stromquist suggests that critical gender issues can be appropriated from feminist discourse to support a more liberating "manipulation of gender identities through schooling and the mass media" (p. 454). In this genre, see also Dimitriadis and Kamberelis, "Shifting Terrains: Mapping Education within a Global Landscape" (1997).
 - 24 In contrast to McLaren's call to base critical pedagogy on neo-Marxist theory updated with selective postmodern appropriations, Jennifer Gore advocates Foucault's strategy of leaving specific tactics and strategies of resistance to those directly involved in struggle at the precise points where their own conditions of life or work situate them. Here the shift is made from a master narrative of emancipation owned by intellectuals to the mininarratives or small stories arising from situated experiences and actual power relations. See Gore (1993).
 - 25 For a valuable study seeking to situate, or map, various contradictory versions of constructivist theory in educational psychology, see Prawat, "Constructivisms, Modern and Postmodern" (1996). Prawat uses textual analysis and conceptual mapping, as in this study, to identify and compare different ways of seeing. This is a fine example of a reflexive practitioner viewpoint at work.
 - 26 A major problem with the moralistic approach found in many critical modernist texts is that it often leads to a dead end of author self-centering where the marginalized get marginalized still more. Nast puts it like this: "Guilt that centers merely on the existence of ... inequality and not on how inequality can be transformed is ... unproductively paralyzing". See Nast (1994).
 - 27 For a variety of ideas on opening new space for radical critique in a postmodern era, see Simons and Billig, *After Postmodernism: Reconstructing Ideological Critique* (1994). I found Richard Harvey Brown's chapter "Reconstructing Social Theory after the Postmodern Critique" (pp. 12–37) especially helpful in its advocacy of self-reflexive talk-about-talk and its advice on teaching debates.
 - 28 See introduction to Beck et al. (n. 6 above).
 - 29 Here Welch worries that disruptive postmodern ideas will be used as a stick to drive performativity efforts in the academy. While this, indeed, seems to be under way, his call to reassert a universal ideal of Western democracy as an opposing criterion of judgment, as an absolute standpoint to judge the truth, sounds a bit Eurocentric and nostalgic. For a serious attempt to rethink political space today, that is, the "hyperspace" of politics in the "global village" in which we all now live, see Magnusson, *The Search for Political Space: Globalization, Social Movements, and the Urban Political Experience* (1996).
 - 30 For related work framed in this perspective, see also Coulby and Jones (1995, 1996). See also Green (1994, pp. 136–49) and Schriewer (1988, pp. 25–83), where the text ambitiously advocates a "science of comparative education" based on styles of reasoning, or *Denkstile*, in "divergent types of theory viz, scientific theories and reflection theories" (p. 30).
 - 31 In a related study, Peter Jarvis uses the concept of "late modernity" to situate performativity concerns of non-Western cultures consuming educational knowledge that can now be packaged and marketed globally. See his "Continuing Education in a Late-Modern or Global Society" (1996).
 - 32 As in the study presented here, the authors report finding a "fragmented field constituting chaos for some, and for others a mosaic of diverse and sometimes competing goals, theoretical frameworks, methodologies and claims" (p. 113). In 1988, they found that CIES members by and large "placed their hopes in the multiple possibilities of diversity and defended the field's eclectic stance as a widening rather than an absence of identity" (p. 127). I locate this view as the "postparadigmatic eclecticism" position in the center of Figure 2. It is, perhaps, still the favored perspective of most comparative education practitioners, but a follow-up study is long overdue. For a perceptive review of our *Social Cartography* book from this eclectic perspective, see Pickeles, "Social and Cultural Cartographies and the Spatial Turn in Social Theory" (1999).
 - 33 Nigel Blake also addresses this challenge in his perceptive study, "Between Postmodernism and Anti Modernism: The Predicament of Educational Studies" (1996). Blake sees postmodernists resisting the use of a criterion of validity, as advocated here by Watson (i.e., "hard data") and Welch (i.e., "western

democracy”), to settle a usage (see nn. 22 and 30). This would foreclose other stories and represent a claim to universal assent for one criterion. As such, postmodern theory impugns the value of all inquiry frameworks that make an a priori claim to universal validity. Indeed, it is one of postmodernism’s most salient intellectual characteristics to repudiate the notion of uniquely valid or valuable perspectives on itself, or on anything else (p. 43). Here Nigel Blake reiterates the profound skepticism found in anti-Enlightenment and postmodern texts about the universal validity of any single master narrative or grand theoretical story. See Lyotard, *The Postmodern Condition: A Report on Knowledge* (1984), where, with no little irony, the text might well be read as advocating as a master narrative the rejection of metanarratives. Social cartography, as practiced here, seeks to avoid this temptation by recognizing and interrelating all texts and arguments claiming space in knowledge debates.

POLITICS, THEORY, AND REALITY IN CRITICAL PEDAGOGY

Michael W. Apple and Wayne Au

Introduction

Critical pedagogy generally seeks to expose how relations of power and inequality, (social, cultural, economic) in their myriad forms, combinations, and complexities, are manifest and challenged in the formal and informal education of children and adults (Giroux, 1997; McCarthy & Apple, 1988; McLaren, 2005). However, this may actually be too general a statement, for the term “critical pedagogy” is something of a sliding signifier that has been used in multiple ways to describe multiple things. Indeed, at times critical pedagogy seems to have been used in such broad ways that it can mean almost anything from cooperative classrooms with somewhat more political content to a more robust definition that involves a thorough-going reconstruction of what education is for, how it should be carried out, what we should teach, and who should be empowered to engage in it.

This more robust understanding – one in which the two of us are grounded – involves fundamental transformations of the underlying epistemological and ideological assumptions that are made about what counts as “official” or legitimate knowledge and who holds it (Apple, 1979/2004, 2000). This involves a commitment toward social transformation and a break with the comforting illusions that the ways in which our societies and their educational apparatuses are organized currently can lead to social justice. A more robust understanding of critical pedagogy is also based increasingly in a realization of the importance of multiple dynamics underpinning the relations of exploitation and domination in our societies. Issues surrounding the politics of redistribution (exploitative economic processes and dynamics) and the politics of recognition (cultural struggles against domination and struggles over identity), hence, need to be jointly considered (Fraser, 1997).

At the very root of these concerns is a simple principle. In order to understand and act on education in its complicated connections to the larger society, we must engage in the process of *repositioning*. That is, we must see the world through the eyes of the dispossessed and act against the ideological and institutional processes and forms that reproduce oppressive conditions (Apple, 1995). This repositioning concerns both political and cultural *practices* that embody the principles of critical pedagogy; but it also has generated a large body of critical scholarship and theory that has led to a fundamental

restructuring of what the roles of research and of the researcher are (Smith, 1999; Weis & Fine, 2004). Let us say more about what this implies.

The Tasks of Critical Educational Research and Action

In general, there are five tasks in which critical analysis (and the critical analyst) in education must engage:

1. It must “bear witness to negativity”. That is, one of its primary functions is to illuminate the ways in which educational policy and practice are connected to the relations of exploitation and domination in the larger society.
2. In engaging in such critical analyses, it also must point to contradictions and to spaces of possible action. Thus, its aim is to critically examine current realities with a conceptual/political framework that emphasizes the spaces in which counter-hegemonic actions can be or are now going on.
3. At times, this also requires a redefinition of what counts as “research”. Here we mean acting as “secretaries” to those groups of people and social movements who are now engaged in challenging existing relations of unequal power or in what elsewhere has been called “non-reformist reforms” (Apple, 1995; Apple & Beane, 2007; Gandin, 2006).
4. In the process, critical work has the task of keeping traditions of radical work alive. In the face of organized attacks on the “collective memories” of difference and struggle, attacks that make it increasingly difficult to retain academic and social legitimacy for multiple critical approaches that have proven so valuable in countering dominant narratives and relations, it is absolutely crucial that these traditions be kept alive, renewed, and when necessary criticized for their conceptual, empirical, historical, and political silences or limitations. This includes not only keeping theoretical, empirical, historical, and political traditions alive but, very importantly, extending and (supportively) criticizing them. And it also involves keeping alive the dreams, utopian visions, and “non-reformist reforms” that are so much a part of these radical traditions (Jacoby, 2005; Teitelbaum, 1993).
5. Finally, critical educators must *act* in concert with the progressive social movements their work supports or in movements against the rightist assumptions and policies they critically analyze. Thus, scholarship in critical education or critical pedagogy implies becoming an “organic intellectual” in the Gramscian sense of that term (Gramsci, 1971). One must participate in and give one’s expertise to movements surrounding struggles over, following Nancy Fraser (1997), what we have called a politics of redistribution and a politics of recognition. As Bourdieu reminds us our intellectual efforts are crucial, but they “cannot stand aside, neutral and indifferent, from the struggles in which the future of the world is at stake” (2003, p. 11).

These five tasks are demanding and no one person can engage equally well in all of them simultaneously. However, there is a long tradition of critical scholarship and

critical cultural work along multiple dynamics that has sought to “bear witness to negativity” and to recapture the collective memory of pedagogic work that is genuinely counter-hegemonic. We shall examine the latter in the next section.

The Political Roots of Critical Pedagogy

Before the term “critical pedagogy” was coined by critical intellectuals and activists in Latin America such as Paulo Freire, educators from various communities in the United States and many other nations took up projects that would certainly be considered “critical”. These early manifestations of critical pedagogy often challenged existing social relations and power structures, raising substantive critiques of race, class, and gender relations as well as offering radical alternatives to then-existing educational forms.

For instance, there exists a long-standing tradition in the African American and Afro-Caribbean communities regarding the aims and nature of their education (Jules, 1992; Lewis, 1993, 2000). At least since the late 1800s, African American intellectuals and activists, for example, have engaged in struggles over the question of just what the education of Blacks in the United States and the Caribbean should consist of, particularly given the context of post-chattel slavery and current institutional racism in their countries. As Watkins (1993) explains, this struggle resulted in what he terms several “Black Curriculum Orientations”: the “accommodationist” orientation – which advocated for the industrial education for African Americans, and was advanced by community leaders like Booker T. Washington; the “Liberal Education” orientation – which sought to develop students’ critical thinking with express intent of increasing social, political, and cultural participation associated with leaders like Reverend Alexander Crummell and W. E. B. DuBois (Lewis, 1993, 2000); and the “Black Nationalist Outlook” – which included the nationalist, cultural nationalist, pan-Africanist, and Black separatist movements associated with Marcus Garvey, Noble Drew Ali, Elijah Muhammed, and Malcolm X (Watkins, 1993). In the Caribbean, the uses of popular cultural forms kept alive what Livingston has called “diaspora knowledge”. Models of popular education based on such cultural memories and forms provided powerful resources to counter the dominant colonizing narratives and methods (Livingston, 2003; Jules, 1992).

Another example of counter-hegemonic activity, this time focused on critical public school organizing around issues of race and class, can be found in the history of Harlem in New York City between 1935 and the early 1950s. The Harlem Committee for Better Schools (HCBS), a coalition of parents associations, churches, and teacher and community groups, came together to push for improved schools in Harlem, including free lunches, better working conditions for teachers, and better physical conditions of the schools themselves. The HCBS is notable for several reasons. One is that it was interracial. It originated largely with Jewish communists who were teaching in Harlem schools, and garnered community support through the establishment of parents’ associations and chapters of the Teachers Union, allowing them to develop close ties with most of the African American schoolteachers in Harlem. Another reason noteworthy of the HCBS is that it represented educational reform, activism, and organizing across

constituencies because it included teachers, members of the community, as well as political organizations (Naison, 1985). These educational forms all represent different responses to what historian Woodson (1990/1933) called the “mis-education of the Negro” and signify substantial critical race critiques of public education.

Similar mobilizations in England and elsewhere and around multiple diasporic communities and across other equally oppressive dynamics of differential power involving gender and class at this time and later on can be found. For example, there has been a long tradition of critical feminist critiques of education in nations throughout the world. In the United States, as elsewhere, in the early 1900s several notable women took lead roles in organizing teachers – a predominantly female workforce (Apple, 1986) – for improved working conditions. These included Grace Strahan in New York City and Margaret Haley in Chicago. Others like Kate Ames, who in 1908 challenged the Male Schoolmasters Association in California, fought against the imposition of patriarchy in school organizational and pay structures (Weiler, 1989). Although there were justifiable criticisms that critical pedagogical work of this type marginalized women of color, working-class women, and third-world women, at times these critical efforts did cut across class lines in the United States, England, and elsewhere (Copelman, 1996; Gomersall, 1997; Martin, 1999; Munro, 1998; Purvis, 1991).

The issue of class is crucial here. Class relations and struggles against exploitation, thus, were not invisible in the history of critical education. In fact, they often constituted a prime focus. Early manifestations of critical pedagogy in the United States reached beyond power dynamics associated with the politics of race and gender, although at times these dynamics were also ignored, much to the later detriment of the movement. Between 1909 and 1911 in the United States, for example, over 100 Socialist school officials were elected to various school districts across the country. Between 1900 and 1920, Socialist activists established more than 100 English-speaking Sunday schools in 20 states, ranging in size from classes of 10 students to schools that enrolled more than 600 students (Teitelbaum, 1993). While these Socialist Sunday schools were not part of the public school system – and there were constant struggles over the politics of official knowledge within the public school system as well (Kliebard, 1995) – they represent a class-based, critical community response to public education in the United States at the time. The attempts to build an education that actively sought to interrupt class dominance were pronounced across international borders as well. Socialist educational responses to class relations were mirrored in England and Wales (see e.g., Simon, 1965, 1991) and have a powerful history as well in Latin America for example (Bulhões & Abreu, 1992; Caldart, 2003; Torres, 1997).

This history of critical educational action has parallels in many other nations as well. Indeed, throughout almost every region of the world, there are powerful movements and examples of radical pedagogic efforts both within the formal educational sector as well as in community literacy programs, labor education, antiracist and anticolonial mobilizations, women’s movements, and others (Van Vught, 1991). For example, in South Korea during the first half of the twentieth century, evening schools were established to counter the colonizing efforts of the Japanese occupiers. These counter-hegemonic practices have continued through the efforts of the Korean Teachers Union to build curricula and models of teaching that are based on critical democratic

principles. These efforts have had to overcome years of government repression (Ko & Apple, 1999; Apple *et al.* 2003). Similar tendencies have recently been seen in Turkey, where the government attempted to declare the largest teachers union illegal because of the union's commitment to both a more culturally responsive pedagogy and a critical position on neoliberal policies in education and the economy (Egitim Sen, 2004).

So far we have given a brief set of examples of the efforts by some subaltern groups to challenge dominance in education, efforts that became increasingly widespread even in the face of what were serious and often extremely repressive consequences. But as we mentioned earlier, critical education has also involved not only overt political and cultural action, it has also both generated and been generated by a growing emphasis on research that both documents reproductive forces in schools and points to possible avenues to challenge such reproductive forces. Thus, the entire range of critical pedagogical movements and efforts has been complemented by the growth of multiple communities of scholarship that have sought both to bear witness to negativity and document spaces for counter-hegemonic work. At first, the task of bearing witness took center stage and it is to this we now turn. Once again, in the limited space of a chapter of this size, all we can accomplish is to provide a brief outline of the development, gains, and tensions within and between these theoretical and empirical traditions.

Bearing Witness and Expanding Dynamics

The mid-to-late 1970s was a key period in the development of critical analyses of education, particularly those that addressed how macro-level social, cultural, and economic structures related to school organization and experience (Whitty, 1985). The central critical research focus of the time revolved around examining the relationship between schools and social, economic, and cultural reproduction. While the tradition of critically examining the content and processes of cultural reproduction was already underway in the new sociology of education in England (Young, 1971), in critical curriculum studies in the United States (Apple, 1971), and in the work of Bourdieu and Passeron (1977) in France, much of the debate over this relationship crystallized around Bowles and Gintis' (1976) *Schooling In Capitalist America*. In their book, Bowles and Gintis asserted a macro-level correspondence principle between the machinations and needs of capitalist production with that of the production of economic class-based differences in and through education. Further still, this correspondence was a relatively mechanical process, as the structure and outcome of schools seemed to be completely determined by capitalist economics and the paid workplace alone in a largely unmediated way (Cole, 1988). Indeed, as one of us has argued (Au, 2006), this mechanistic analysis actually falls outside of the "traditionally" Marxist, dialectical materialist tradition.

Even with its evident problems, Bowles and Gintis' work did two things. First, it helped establish the contemporary relevance of Marxist, neo-Marxist, and quasi-Marxist analyses of schools and education (Whitty, 1985). Second, it sparked a contentious debate, spurred a number of far-ranging critiques of economic determinist explanations of inequality in education, and moved critical researchers to go even further in their analyses

of cultural and ideological reproduction in schooling as well (Apple, 1979/2004; Au, 2006; Cole, 1988). The net result for critical theorists was to continue moving beyond relatively simplistic versions of class-based analyses of schools came to the forefront (Bernstein, 1977; Bourdieu, 1984) as did more explicit attention to issues of race and gender, signalling the growing influence of British and French theories of the relationship among culture, social institutions, and education (Young, 1971).

At the same time, the mobilization and movements that came out of feminist and racialized populations rightly challenged the emphasis only on class in critical work in both social and economic reproduction. The very notion of reproduction itself was dramatically challenged in the process (Giroux, 1983). Issues of contradiction and conflict within and between these dynamics became considerably more significant. Thus, for instance, McCarthy and Apple (1988) advocated a “nonsynchronous parallelist” framework for understanding issues of race, class, and gender, one that recognized the intense and contradictory interactions within and among various dynamics of exploitation and domination and one that asked critical educators to be less reductive in their assumptions. Hence, for example, it was argued that racial inequality could not solely be reduced to economic inequality (Apple & Weis, 1983), a position that while not yet fully developed, prefigures some of the immensely productive arguments of critical race theory (Gillborn, 2005; Ladson-Billings & Tate IV, 1995).

In order to seek new theoretical directions that addressed the complexities that analyses such as Bowles and Gintis’ (1976) lacked, many critical scholars such as Giroux turned to the works of Antonio Gramsci, Louis Althusser, Stuart Hall, and Raymond Williams, as well as to the scholars from the Frankfurt School. Soon an entire series of insightful analyses based on the relationship among lived culture, schooling, and the economy developed. Stimulated in part by Willis’s (1977) classic book on youth cultures, class relations, and masculinity, *Learning to Labour* and McRobbie’s (1978) equally thoughtful insights into the ways in which gender and class dynamics interacted inside and outside of schools, major gains quickly arose and continue to be made in understanding the ways in which popular cultural forms and practices are dialectically interconnected with classed, raced, and gendered/sexed practices and dynamics (Arnot, 2004; Epstein & Johnson, 1998; Willis, 1990). These analyses pointed to contradictory spaces in peoples’ lived experience where cultural work might be able to bring youth under more progressive leadership (Weis, 1990).

Yet, even with the immense gains that have been made in Marxist and neo-Marxist understandings and in research based on feminist and antiracist theories, these traditions have come under serious scrutiny. Feminist poststructural approaches and powerful analyses based on critical race theory have made provocative interventions into the debates over all of this (Ladson-Billings & Tate IV, 1995; Luke & Gore, 1992). A focus on indeterminacy, on capillary power, on power as productive not only reproductive, on identity and on its discursive “constitution” often based on Foucauldian insights (Youdell, 2006) have made critical pedagogy a terrain of rich debate and conflict, giving it a vitality that keeps it alive and growing. While we may have worries about the ways in which Foucauldian approaches have acted to tacitly depoliticize the terrain of critical education, to make the world overly discursive, or to de-emphasize the ways in which structural forces actually have immense power (Apple, 1999),

we do, however, wish to be respectful of the immense efforts in which deeply committed people have engaged to bring new insights and a broader sense of the political. This has been especially the case in those nations where the traditional left seemed to have lost some of its vitality (Dussel, 2004; Gimeno, 2005).

The international nature of these issues has been made more visible by the growth of analyses based on postcolonial perspectives. Influenced by the work of such figures as Edward Said, Gayatri Spivak, Ngugi Wa Thiong'o, and Homi Bhabha, postcolonial theories have proven to be increasingly influential as critical educators attempt to come to grips with the globalization of neoliberal and neoconservative policies and with attempts to interrupt them (Burbules & Torres, 2000; Dimitriadis & McCarthy, 2001; Singh, Kell, & Pandian, 2002). This is what makes the work and influence of Paulo Freire, a person whose name became nearly synonymous internationally with critical pedagogy, so significant. We shall use the development and status of Freire's as a template to continue our discussion here.

Paulo Freire and the Development of Critical Pedagogy

The publication and distribution of *Pedagogy of the Oppressed* (Freire, 1974) was a landmark event for critical pedagogy. Building on the postcolonial theories of Franz Fanon, Amilcar Cabral, and Albert Memmi, and the revolutionary egalitarian vision of Marx, Engels, and Lenin, Freire and his work are perhaps the most iconic and most widely used amongst critical pedagogues worldwide. *Pedagogy of the Oppressed* alone has sold over 750,000 copies since its publication in 1970, and it would not be an exaggeration to state that Freire represents the growth and influence of critical pedagogy internationally, particularly in postcolonial contexts (McLaren, 2000).

Freire's critical pedagogy revolves around the central idea of "praxis", the unification of critical reflection and critical action. It seeks to be a pedagogy that enables students and teachers to be "Subjects of their own history". They become actors (and it is a constant process of becoming) who can look at reality, critically reflect upon that reality, and take transformative action to change that reality, thereby deepening their consciousness and working toward a more just world. Making use of the teaching methods of problem posing and dialogue, Freire's critical pedagogy intends for all relationships of hierarchical power to be challenged, including that of the student-teacher relationship. In this way, Freire's critical pedagogy invites students and teachers to become change agents both in their classrooms and in the world around them (Freire, 1974; Shor & Freire, 1987).

In Europe, Africa, Latin America, indeed the world over, the instantiation of critical pedagogical theory and practice cannot be dealt with without emphasizing the profound influence of Freire and those who have followed in his path. Even in the United States, a place where critical pedagogy has its own indigenous roots among people of color in feminist educational activities (Hooks, 1994) and labor education (Horton, 1990), and where there has sometimes been great antipathy toward overtly radical educational work, Freire's influences can be seen (McLaren, 2000, 2005; Shor, 1992; Rethinking Schools, 2005).

While Freire's importance to critical pedagogy would be difficult to overstate, his work was not perfect, and many scholars have sought to critique it, both justifiably (Weiler, 1991) and mistakenly (Bowers & Apffel-Marglin, 2005), or some measure of both (see e.g., Ellsworth, 1989). For instance, Weiler (1991), points to Freire's lack of specific analysis regarding patriarchy and women's oppression as they exist in education generally and within his own theorizing specifically. Others, such as Ladson-Billings (1997) have critiqued Freire's critical pedagogy for not adequately dealing with issues of race (see also Leonardo, 2005). Still others in the more critical wings of the environmental movement have critiqued critical pedagogy for needing to be "greened" – that is, needing to include environmental concerns as actively as it has included social concerns (Au & Apple, 2007; McLaren, 2005). In regard to such critiques Freire (1997) saw himself as providing "the possibility for the educator to use my discussions and theorizing about oppression and apply them to a specific context" (p. 309), which he felt could be applied to deal with racism and women's oppression in other contexts (Freire & Macedo, 1995). Indeed, Hooks (1994), Stefanos (1997), and Weiler (1991) all find affinity between Freire, feminism, and antiracism. Regardless, these critiques mirror the tensions within the critical educational research community to which we pointed earlier.

All of this is not to say that critiques of Freire's critical pedagogy are not warranted, or that critical pedagogy itself (beyond just that of Freire's conception) has no need for growth. Much as some critical scholars and theorists have critiqued and pushed on the edges of Freire's work, feminists and critical race scholars have likewise struggled to make certain that critical pedagogy generally addresses racism, sexism, the realities of homophobia (Kumashiro, 2002), and other forms of power in education (Erevelles, 2005). Our position is that, when guided by an urge to collectively build a "decentered unity" that tries to work across differences, critiques of critical pedagogy – feminist, critical race, and ecological as well as others – are valuable because they generally help the field evolve and strengthen it as a more viable means for making educational and social change (Au & Apple, 2007).

Tensions and Contradictions

The picture we have given so far, however, is deceptively linear. Critical traditions are complicated and filled with tensions and disagreements. Furthermore, there can be a loss of memory of important gains and as well a return to reductive and essentializing perspectives that have serious deficiencies. For example, economic functionalist perspectives strikingly similar to Bowles and Gintis (1976), but without their knowledge of economics, did indeed return. Given the rise of postmodern and poststructural analyses in education in the 1990s, types of analyses which tended to evacuate class from their critical frameworks – this pull to return to more economic explanations of schooling and social reproduction is somewhat understandable – led some Marxist and neo-Marxist scholars to essentially take ideological stands that stressed the importance of the materiality of class relations (Cole *et al.*, 2001). Unfortunately, in the process many of the gains that had been made in the critical traditions in our understanding of the complexities of

class relations within the state and between the state and civil society were lost – as if Althusser, Poulantzas, Jessop, Dale, and others had never written anything of importance. The immensely productive material on the relationship between ideology and identity; on the relationship among culture, identity, and political economy; on the crucial impact of politics; and on the power of social movements that cut across class lines, as well as a number of other issues, is now either seen by some to be a rejection of key tenets of the Marxist *traditions* (the plural is absolutely crucial here) or these advances are said to deal with epiphenomenal concerns.

On both sides of the Atlantic, a number of people have mounted attacks on these advances in the name of purifying “the” Marxist tradition of the taint of culturalism and of the sin of worrying too much about, say, gender and race at the expense of class (Kelsh & Hill, 2006). The British version of this simply does not understand the history of the United States and many other nations and the salience of race as a relatively autonomous and extraordinarily powerful dynamic in the construction and maintenance of its relations of exploitation and domination (Gillborn, 2005). Like Britain, in the United States there are crucial reasons to deal absolutely seriously with class and the materialities of capitalist relations. At times, however, this aim of purification seems to treat the realities of schools and other cultural and educational sites and the struggles over them largely rhetorically. It is as if this particular version of Marxism floats in the air above the material and ideological realities of the object of its analysis – education. This is a distinct problem, since as we noted earlier, critical analyses that are cut off from the actual movements surrounding schooling and the realities of pedagogy, curricula, evaluation, policy, and governance simply remain “on the balcony”, disconnected from material life.

Let us hasten to stress that critical discussions of the social relations of production and of class antagonism are crucial to our understanding of the limits and possibilities of critical cultural and educational work. No critical analysis can be complete without them. But they should be directly connected to something – for example, the *specifics* of such things as the labor process of teachers, the neoliberal and neoconservative restructuring of our institutions of education, the racialization of educational policy and practice, the politics of official and popular knowledge, the complex and contradictory effects of globalizations (there are different processes, not a single process, at work here) on the ground, and so on.

The above point again speaks to the tasks of critical educational analyses and action to which we pointed earlier. These tasks cannot be satisfied by rhetorical artifice, nor can an overly simplistic rejection of the theoretical and political gains that have come about because of the struggles of multiple movements be a satisfactory response. The hard work of building a decentered unity that acts on many fronts remains. Can we continue to build on the gains being made within the Marxist and neo-Marxist traditions and also integrate them with the intellectual tools and political insights within the growing traditions of critical race theory, feminisms, poststructuralisms, post-colonialisms, queer theory, disability studies, critical environmentalisms, and similar movements? Critical pedagogy must answer this question as we move deeper into the twenty-first century.

Critical Pedagogy and Conservative Social Movements

The vitality and the productive conflicts within critical pedagogy we have outlined here do not guarantee success, however, even as they remain vitally necessary. Done well, critical pedagogy offers analyses that provide theorists and practitioners a means to intervene in ongoing, even increasing, social and educational inequalities. However, critical pedagogy is also sometimes weakened by its tendency toward “romantic possibilitarianism” (Whitty, 1974), its lack of a sophisticated strategic sense of the power of social movements, and especially rightist social movements inside and outside of education in a considerable number of nations (Apple, 2006; Takayama & Apple, 2007). This is a crucial weakness, since the interventions associated with critical pedagogy are of even greater importance given the recent formation of extremely powerful rightist alliances in the United States, Japan, Australia, and so many other nations today.

As one of us (Apple, 2006) has argued, there exists an alliance of four major groups in both the United States and an increasing number of other nations in the world. These groups and the tactical alliance they have formed have varying degrees of power and effectiveness, depending on regional and national histories and the balance of forces in each local site. However, it has become evermore clearer that the forces behind this alliance currently hold hegemonic power by creating connections between people’s “good sense” and using such connections to disarticulate social groups and individuals from their previous ideological and social commitments and rearticulate them to new ideological and social commitments. This is a very creative process, one examined by such scholars as Hall (1980b), Apple (1996; 2000; 2006; 2003), Apple and Buras (in press), J. Torres (2001) and a number of others.

In many nations this alliance – part of what has been called “conservative modernization” (Apple, 2006; Dale, 1989–1990) – is made up of at least three and sometimes four social forces – neoliberals, neoconservatives, authoritarian populist religious conservatives (particularly powerful in the United States, Pakistan, India, Israel, and elsewhere), and the professional and managerial middle class. Neoliberals are generally guided by a vision of a weak state, students as human capital, and the world as a supermarket ripe for consumer (and producer) competition. In education, the neoliberal agenda manifests in closer linkages between schools and businesses as well as the implementation of “free market” reforms such as school vouchers into education policy. Neoconservatives, on the other hand, are usually guided by a vision of a strong state that asserts control over knowledge, culture, and the physical body. In education, neoconservatism manifests in national and statewide testing and curricula, content standards, the heralding of the Western canon of knowledge, a relatively uncritical patriotism, and moral education (Apple, 2006; Buras & Apple, in press).

Authoritarian populists are distinctly different from both neoliberals and neoconservatives. Their sensibility regarding social order comes directly from Biblical authority and “Christian morality” (although at times its authority may come from particular readings of the Koran or of, say, Hindu texts as in the Hindutva movement in India). Inerrantist interpretations of sacred texts provide guidelines for family structure and gender roles – and for what counts as legitimate knowledge and action in general. In education in the West, the authoritarian populist agenda manifests itself, for instance, in struggles over the exclusion of evolution and the inclusion of creationism

and intelligent design in science classes and in the rapid growth of home schooling, a phenomenon now found in increasing number in countries such as Denmark, Norway, Germany, Australia, England, Israel, and elsewhere (Apple, 2006).

The fourth part of this alliance is the professional and managerial new middle class. This class fraction uses its technical expertise in management and efficiency to support systems of accountability, assessment, production, and measurement required by neoliberal marketization and neoconservative control over knowledge (cf. Clarke & Newman, 1997). In education, this class fraction supports and benefits from, for instance, systems of high stakes, standardized testing and educational policies built upon reductive forms of accountability as they provide the technical means to make these systems and policies operational. They engage in complicated conversion strategies in which particular kinds of capital (cultural capital) are converted into social and economic capital (Apple, 2006). While each group of this alliance has its own internal dynamics and historical trajectories, together it has brought together different social tendencies and political commitments and organized them under its own general leadership, and thus represents a “conservative modernization” of social, cultural, economic, and educational policy in multiple nations, including those with a supposedly social democratic or even socialist past (Apple, 2006, 2003).

There are two reasons to devote critical attention to these forces and movements. First, whether we like it or not, these movements have been increasingly powerful in transforming our core ideas about democracy and citizenship. The social, economic, and educational effects of the policies that have come from the Right often have been strikingly negative, especially for those who have the least in our own and other societies (Apple, 2006, 2003; Apple & Buras, 2006). And one of the major effects has been to make it increasingly difficult to maintain the legitimacy of critical educational theories, policies, and practices.

Second, there is much to learn from the forces of the Right. They have shown that it is possible to build an alliance of disparate groups and in the process to engage in a vast social and pedagogic project of changing a society’s fundamental way of looking at rights and (in)justice. Radical policies that only a few years ago would have seemed outlandish and downright foolish are now accepted as commonsense. While we should not want to emulate their often cynical and manipulative politics, we still can learn a good deal from the Right about how movements for social change can be built across ideological differences (Apple, 2006). Capitalism (as well as the historical regimes surrounding race and gender, and the intersections and contradictions of these dynamics) plays a major part of the driving force behind these dynamics and movements, but saying that says very little about *why* people join rightist mobilizations and movements and how they might be convinced to join more progressive ones.

Critical Pedagogy and Progressive Social Movements

While it is crucial “bear witness,” to recognize and analyze the strength and the real consequences of neoliberal and neoconservative policies (Apple, 2006) and to document the ways in which new social movements can grow and have grown to counter such conservative movements and tendencies, it is also essential to understand the renegotiations

that are made at regional and municipal levels. As Ball emphasizes, “policy is ... a set of technologies and practices which are realized and struggled over in local settings” (1994, p. 10). Thus, rather than assuming that neoliberal and neoconservative policies dictate exactly what occurs at the local level, we have to study the rearticulations that occur on this level to be able to map out the creation of alternatives. It is here that the critical research tradition(s), the role of the researcher as a “critical secretary”, and the Freirean emphasis on the politics of interruption join.

Jean Anyon’s (2005) recent book, *Radical Possibilities: Public Policy, Urban Education and a New Social Movement*, provides a case in point.¹ It describes and critiques the class and race structuring of schooling in the United States — and at the same time in the process ultimately offers possibilities for mobilizing around new social movements. Anyon recognizes something others have argued at greater length elsewhere — that it is social movements that are the driving forces behind a good deal of social and educational transformation (Apple, 2000). Further, she directs our attention to the historical and current progressive mobilizations that have made a difference in society. She sets about examining the specifics of such social movements, documenting why and how they pushed this society, sometimes against great odds, toward a greater commitment to social justice. In the process of telling the stories of different kinds of movements, Anyon also shows how, by participating in political actions, new activist identities are formed by dispossessed groups at the same time as very real progress is made culturally, educationally, politically, and economically (Apple & Buras, 2006). But activist movements do not just help to transform economic, political, cultural, and educational institutions and policies. They also have profound effects on other sympathetic organizations. Movements making what seem at the time to be utopian and radical demands historically have pushed more mainstream organizations along, creating a situation where they too must support fundamental changes in policies that are deeply discriminatory and harmful.

While we concur with Anyon’s claim that schools can play crucial roles in raising critical questions about, and building movements to challenge, both the ways in which the economy now functions unequally and the ways in which, say, the politics of race operates in every one of our institutions, we are not romantic about these possibilities. Schools are sites of conflict. They embody not only defeats, but also victories in many countries. Educators in a number of nations have had to cope with the major transformations of ideology, policy, and practice to which we have pointed in this chapter. For us, it is important to learn two things from the experiences of other educators who are struggling against the forces of inequality. First, we can learn about the actual effects of neoliberal and neoconservative policies and practices in education. Second, and even more important, we can learn how to interrupt neoliberal and neoconservative policies and practices and how to build more fully democratic educational alternatives (Apple, 2006; Apple & Buras, 2006).

One of the best examples of this can currently be found in Porto Alegre, Brazil (Gandin, 2006). The policies that were put in place by the Workers Party, such as “participatory budgeting” and the “Citizen School”, have helped to build support for more progressive and democratic policies there in the face of the growing power of neoliberal movements at a national level. The Workers Party was able to increase its

majority even among people who had previously voted in favor of parties with much more conservative educational and social programs *because* it has been committed to enabling even the poorest of its citizens to participate in deliberations over the policies themselves and over where and how money should be spent. By paying attention to more substantive forms of collective participation and, just as importantly, by devoting resources to encourage such participation, Porto Alegre has demonstrated that it is possible to have a “thicker” democracy, even in times of both economic crisis and ideological attacks from neoliberal parties and from the conservative press. Programs such as the “Citizen School” and the sharing of real power with those who live in *favelas* (shantytowns), as well as with the working and middle classes, professionals, and others, provide ample evidence that thick democracy offers realistic alternatives to the eviscerated version of thin democracy found under neoliberalism. The administrative, organizational, and curricular reforms – taken together – have helped to create the beginnings of a new reality for the excluded. They have forged new leadership, brought about the active engagement of the communities with the communities’ own situations, and led to much more active participation in the construction of solutions to these problems (Apple *et al.*, 2003; Gandin, 2006).

Once again, we do not wish to be romantic here. There are problems in Porto Alegre – political, economic, and educational (Gandin & Apple, 2003). However, in spite of this, we are optimistic about the lasting impact of its democratizing initiatives and its construction of a more diverse and inclusive education. By itself, the Citizen School has been very successful in including an entire population that, if it were not for this project, would be out of the schools and even further excluded in an already actively excluding society. But the larger educative aspect of the Citizen School – empowering impoverished communities where they are situated and transforming both the schools and what counts as “official knowledge” there – is also of significant moment. The transformations in Porto Alegre represent new alternatives in the creation of an active citizenry – one that learns from its own experiences and culture – not just for now, but also for future generations. For these very reasons, we believe that the experiences of Porto Alegre have considerable importance not only for Brazil, but also for all of us who are deeply concerned about the effects of the neoliberal and neoconservative restructuring of education and of the public sphere in general. There is much to learn from the successful struggles there. Understanding these struggles, documenting them, and actively supporting them can assist us all in our attempts to live out the tasks of critical educational analysis and action that we noted at the outset of this chapter.

Conclusion

In this chapter, we have outlined an ambitious agenda. We have suggested a series of interrelated tasks that are essential to the continual growth and success of critical education: “bearing witness”; analyzing reality in such a way that spaces for counter-hegemonic work are identified; acting as “critical secretaries” for critical social movements and practices; keeping alive multiple critical traditions in supportive but also self-critical ways; and participating in the movements that aim at social and

cultural transformations. Each of these is important, especially in a time both of conservative modernization and of attacks on an education worthy of the term *critical*.

But we have not been satisfied with simply enumerating a list of “what is to be done”. We have also pointed to some of the roots of critical education in the practices of subaltern groups in earlier periods of educational actions. In addition, we have surveyed the field of scholarship that has emerged over decades of work on the relationship(s) among power, education, reproduction, and transformation. And we have detailed the efforts of critical educators in policy and practice, in, for example, the work of Paulo Freire and the continuing possibilities in Porto Alegre. When these examples are connected to many others – the democratic schools movement in the United States (Apple & Beane, 2007), the critical pedagogical efforts now being built in schools and communities in places such as Spain, Venezuela, and elsewhere – and the list could go on and on – there is a sense of immense ferment and vitality. None of this is easy. As in the past, all of this requires constant struggles in both the state and civil society.

There is much more that could be and needs to be said, especially in detailing much more about the iterations of each of these areas in nations throughout the world. We are certainly aware of how much more needs to be documented both in terms of critical scholarship and critical policies and practices. However, perhaps this speaks to the power of the multiple intellectual, political, and cultural/educational projects associated with critical pedagogy in all its forms. It says something about the spread of these multiple resources and projects that no chapter – no matter how detailed – can do justice to the labor of so many people and movements. Even in the face of the global restructurings brought about by neoliberal and neoconservative theories, institutions, and policies, we remain optimistic that counter-hegemonic movements inside and outside of education will continue to grow and to challenge dominance. Continuing to take the tasks to which we pointed earlier seriously would be an important step in making this a real possibility.

Notes

- 1 We need to openly state that a few of the books mentioned in this essay, particularly the books by Anyon and Weis, are in a series that one of us (Apple) edits. But since the task we were asked to take on in this essay was to give a sense of the state of critical work in the United States and elsewhere, and these books are important statements about this, we felt that to exclude them would have led to a major silence in such an account.

THE FUTURE OF INTERCULTURAL STUDIES IN MULTICULTURAL SOCIETIES

Jagdish S. Gundara

Most of the diverse or multicultural societies have not succeeded in eliminating discrimination and inequalities within their national boundaries. Many of the educational initiatives have floundered and failed to make any significant difference to the educational outcomes of the poorer groups from diverse groups in society. The capacity of many national systems to resolve internal socio-economic differences and reduce disparities has been increasingly diminished as the powers of national governments to provide constitutional protection to their citizens has decreased. In external terms economic globalisation has in many cases eroded the powers of national public institutions and there are diminishing levels of trust in communities and increasing levels of ethnic nationalism in white Anglo-Saxon Protestant America or in an India marked by Hindu religious fundamentalism. Intercultural initiatives and citizenship and civic education in most countries draw on the received wisdom of the past. The chapter recognises these current dilemmas but will argue that it is not necessary to go forward into the future on the basis of the received wisdom of the past. For instance, in the United States it is not possible to go forward using the purely 'formal' institutional conception of democracy, as an expression of filial piety to America's Founding Fathers based on individualistically conceived liberty. The French Republic also needs to ensure that the public culture and institutions are inclusive of the minority and 'other' cultures. This is necessary to ensure that the corrosive aspects of racism and xenophobia do not undermine trust in democratic institutions and processes remain vibrant and do not stultify. This is because a purely formal democracy is culturally unsustainable, ideologically hollow and can be operationally subverted. To make democratic institutions more viable in the United States and other countries around the world a deeper conception of democracy that expresses the experience-based deeper conception of democracy is needed. Such culturally based democratic values would be inclusive of best values drawn from diverse groups at the local level and strengthen mutualities of community life which give validity to de Tocqueville's analytic concept 'habits of the heart' (Green, 1999, p. vi).

This chapter will examine the ways in which the national might be able to act differently within the regional, continental and international legal and institutional frameworks. It will refer to policies, especially as they pertain to educational rights and entitlements of citizens. Institutions like the European Commission, the Council of

Europe and UNESCO have a major stake in these fast-changing times. The continental and regional organisations like the Organisation of African Unity and Meracuer may have similar obligations within those regions. Within the Commonwealth, the Heads of Government meeting in Kampala have addressed the issue of the transformation of societies to achieve greater political, economic and human development which can use the stronger Commonwealth networks in education to contribute to these agendas (Commonwealth Secretariat, 2007).

Modern states confront increasingly serious challenges within their education systems at the present time. In general terms, social exclusion and inequality on various indices present a threat to the viability of the national political and social systems because of the ways in which such exclusion leads to injustice being institutionalised in many societies. Social and public policy-makers and professionals have a role to play in turning social exclusions into social inclusions using legal and constitutional powers in democratic contexts. Such professionals, however, confront a number of problems. For educators, these include the ways in which issues of difference and diversity have been conceptualised within the recent past, and how in some contexts difference has become construed as a deficit. Such conceptual distortions have further diminished the possibilities of improving the educational outcomes of marginalised and poorer groups in society and this chapter will address some of these issues.

Some of the most intractable problems are found in societies where racism, xenophobia and chauvinism have deepened inequalities in diverse communities which have thwarted ambitions of groups, communities and individuals who feel inter-generationally or permanently excluded. Hence, issues of how to bring about equity and deal with dominant and exclusive 'national' knowledge systems require sustained consideration and a critical appraisal. With the failures of many modern states to provide equity many groups have reverted to more singular and ethnic or religious identities and there are very few (if any) well-considered educational measures to address these issues internationally. Educators need to consider how the failure of the Enlightenment to deal with issues of racism and xenophobia has contributed to the disenchantment with national democratic and constitutional systems and international organisations. The reversion of groups to ethnic and religious identity in singular terms also necessitates a Renaissance and enlightenment amongst all faiths. This is necessary so that they can be effective in equipping believers to function as full citizens in the modern world with all the complexities of the cultural, social, economic and political realities. Single and singularised identities and communities do not have the wherewithal to cope with the new and emerging global inequalities and societal complexities. To address issues of global justice it is necessary to develop cosmopolitan public institutions and civic citizens (New Humanist, 2006). Secular humanism is now deeply entrenched in societies following long struggles waged by the subordinated and oppressed groups. Nevertheless, literalist religions are trying to reverse these victories in various parts of the world and replace them with religiously based societal values, mores, norms and institutions (*The Economist*, 2007, pp. 3–20; Gundara, 2000a).

Education systems can address some of these challenges and educators need to carefully consider these issues, and devise appropriate policies to deal with a range of problems confronted by social systems. This process needs to be part of much broader

public policy measures to obviate some of the current crises, which have led societies to fragment as has happened in south-east Europe, parts of central Africa and Somalia. Long-term conflicts also currently afflict countries like Afghanistan where international agencies and countries like Britain and Canada are trying to rebuild state institutions and structures especially schools for girls. Since 2001, 6 million children are in schools and over a third of them are girls (DFID, undated).

From an intercultural perspective and within the field of education a number of current and future challenges will be discussed in this chapter. These include the liberalisation of the public education systems on the grounds of meeting the prospects and problems presented by economic globalisation. There will be a discussion on the inadequate concepts and frameworks used in the field of intercultural education and how the practice-led initiatives have increased educational inequalities, knowledge centrism, racism and religious intolerance. This situation is exacerbated by the inadequacy of current teacher education (training) and the powerful negative role that the increasingly proliferated, privatised and commercial media plays in diverse societies.

The International Context: Globalisation, Diversity and Uniformity

The Universal Declaration of Human Rights in Article 26.1 provided for the right to education for everyone and is one of the building blocks of human rights more generally. Article 26.2 states:

Education shall be directed to the full development of human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial and religious groups, and shall further the activities of the United Nations for the maintenance of peace. (Batelaan, & Coomans, 1999)

This constitutes a good definition for intercultural education but it remains far from a reality because at least one billion people have largely been by-passed by aspects of globalisation such as the right to education (Power, 2000). The right to education from the Universal Declaration is translated into a more precise form in the International Covenant on Social and Cultural Rights and the International Covenant on Civil and Political Rights. In the 1980s and 1990s the human rights agenda has broadened with recognition of development rights, environmental rights and a more precise formulation of children's rights. The UN Convention on the Rights of the Child devotes two articles, 28 and 29, to the rights to education and the aims of education (WCCD, 1995).

The Dakar Framework for Action committed signatories to 'ensuring that by 2015 all children, particularly girls and children in difficult circumstances, and those belonging to ethnic minorities, have access to and complete, free and compulsory primary education of good quality'. In this sense the challenge for UNESCO's Education for All (EFA) is not just limited to the provision of basic and primary education in poor countries but also quality education to all, which by definition has to be intercultural in

both the richer and poorer countries. The UNESCO document 'Education and Cultural Diversity' established a principal priority for the year 2002–2003 and stressed that:

UNESCO will encourage issues involving values education in multilingual and multicultural societies to be included within national EFA action plans. (UNESCO, 2002)

This focus made the Dakar Framework for Action more intercultural by including provision for the nomadic, traveller and gypsy populations. In the Americas these groups include the Inuit, Maya and Quechua peoples. The importance of EFA for industrialised countries in many parts of the world has been to ensure that the educational content is appropriate to the likely future international context. In this sense unless education is intercultural it cannot provide equality and quality education for all. The provision of educational measures which is by definition intercultural and leads to greater levels of equality has been criticised as 'watering down' or lowering the quality of education. Such critiques need to be addressed to ensure that intercultural policies and practices do not lose credibility, since quality and equality in education go hand in hand (UNESCO, 2003). Education at the broadest level requires a partnership between statutory and formal education institutions within the public sector; with the private sector and voluntary sectors to provide with support for enhancing the informal educational provision for the whole community.

Moreover, there are several other hurdles on the way. Symbolic of such hurdles is the lack of action following the two major UN Conferences held in Durban on Racism and in Johannesburg on the Environment. Many member states of the UN marginalised the centrality of these issues, and since the Conference little corrective action has been taken at national levels. This has represented a lack of political will at both the national and international levels. Certain thinkers have even become despondent about the human condition. For instance, John Gray in his pessimistic and depressing book *Straw Dogs* indicated that little can be done to change the state of the world. He forcefully makes the following point:

At present there are nearly two hundred sovereign states in the world. Most are unstable, oscillating between weak democracy and weak tyranny; many are rusted through with corruption, or controlled by organised crime, while regions of the world – much of Africa, Southern Asia, Russia, and the Balkans the Caucasus, and parts of South America – are strewn with corroded or collapsed states. At the same time, the world's most powerful states – the United States, China and Japan – will not accept any fundamental limitation on their sovereignty. They are jealous of their freedom of action, if only because they have been enemies in the past and know they may become so in the future. (Gray, 2002, p. 12)

The attempts by the European Union to embed national sovereignties in multiple layers of rules, norms and regulations are an attempt to "obviate the violent history of the first half of the 20th century as the result of unbridled exercise of national sovereignty" (*The Guardian*, 7/9/2002). It is to be hoped that as a result of integrative processes

intercultural relations in twenty-first-century Europe will improve especially if notions of 'fortress Europe' in all areas of public and social policies including education are obviated. Reduction of inequality between and within richer and poorer countries can help reduce the likelihood of Europe being constructed as a fortress. Within Europe high levels of discrimination and inequalities between the immigrant and poorer communities has the potential for intercultural conflict and violence. Fortress mentalities and societies exist in most parts of the world and in socially diverse communities act as inhibitors for the provision of equalities in education. Measures to make education more inclusive and the provision of skills-based learning can obviate some of the brick walls which thwart ambitions. The DFID report on Afghanistan does indicate a shift in this direction especially in the education for girls and skills for women (DFID).

Therefore, some of the exclusive rather than inclusive tendencies referred to above are mirrored in the way in which intercultural relations and understandings at one level are being enhanced in some societal contexts and levels. In other societies and at many other levels intercultural conflicts on the grounds of racial, religious, linguistic, class and nationality are being exacerbated. This is the case in states in south-east Europe and Somalia where the governments have difficulties in curbing the literalist instruction (which of course is not very 'educational') is provided by many ethnically based institutions. There are, however, marked differences between an 'ethnically' diverse south-east Europe and the fragmentation based on wide-ranging differences, and Somalia where the 'ethnic' differences are very few. Therefore, it can be suggested that the narcissism of small differences in Somalia has been its continuing ruin.

At the global level many of these issues are not only a result of contemporary globalisation but also of the historical legacies of nationalism and the empires of the nineteenth century. If international initiatives especially of the United Nations agencies fail to succeed in bridging gaps then increasingly larger numbers of member states and their governments will have to deal the fragmentation of societies because of the resultant inequalities, polarisations, conflicts and unregulated competition. This section concludes by arguing that the gaps between people remain because even though increased multiculturalism within polities creates possibilities of better intercultural relations, it also increases the prospects of intercultural conflicts unless institutions of the state take positive measures including educational ones to foster equalities and to minimise situations of conflict.

Issues and Concepts

One of the problems arising from the complex range of issues causing intercultural conflicts is that there is very little agreement about the use of terms or a framework of analysis. In many English-speaking countries, some academics argue that the term 'multiculturalism' has been racialised. There is some truth to this assertion; for example, activists and others used issues of discrimination and diversity to only tackle discrimination against themselves and their particular communities. The ways in which policies arising from such a narrowly defined political stance were devised tended to suggest that only certain groups faced exclusion and discrimination. For instance, in

Britain activists from Asian and Caribbean communities did not consider to make common cause with the Jewish, Roma and other minorities to deal with educational inequalities. Many anti-racist policies in education, for instance, tended to stress discrimination against certain immigrant minorities but ignored, for example, the poorer sections of the dominant community and other nationalities and minorities. Hence, there have been interminable debates about the ‘politically correct’ nature of such policies which seemingly favoured and privileged certain groups (Gundara, 2000b, pp. 105–127; Batelaan & Gundara, 1992).

The essentialist rhetoric of such policies has led to some communities being designated as ‘the other’ and furthered the creation of binary oppositions (e.g., the majority–minority; immigrant–citizen; white/black; winners–losers; belongers–non-belongers). These oppositional definitions as well as the hierarchical positioning of groups within societies have detracted from societies developing inclusive institutions based on intercultural policies. Measures to experience the educational process as part of the growing up and learning in a community need to be revisited. This can be done along the lines of an African adage ‘it takes a whole village to educate a child’. At the present time however, the village itself may need re-educating thus necessitating the need for lifelong learning. Lifelong and community-wide learning has to have both formal and informal dimensions and needs to enhance the capacity building of communities to be sustainable at local levels. The provision of these educational measures within plural and diverse communities is a human right (Gundara, 1992; Batelaan & Gundara, 1992). The role of community education in London provides a positive way forward for such educational initiatives (Gundara & Jones, 1990, pp. 142–154). Further education colleges in Britain promote common values but in many institutions the political far right and religiously oriented influences pose a threat to the development of shared values amongst young peoples (*The Education Guardian*, 27/11/2007).

There is also another more complex issue of difference and diversity especially since it is sometimes suggested that we should celebrate diversity. This, rather superficial notion of celebration does not take cognisance of the way in which difference has been construed as a deficit and as a way of stigmatising groups. For instance, celebrating linguistic diversity without developing multilingual policies can heighten the lack of access to the curriculum and widen educational inequalities. Hence, policies, practices and strategies for developing linguistic competences of students are important (Gundara, 2005, pp. 237–251).

The UNESCO collaboration on the B@bel Initiative to promote multilingualism on the Internet as well as preventing linguistic segregation and protection of languages which may disappear is an important development. Initiatives in the fields of interculturalism and multiculturalism need to mirror some of the developments discussed in UNESCO’s paper ‘Education in a Multilingual World’ (UNESCO, 2003).

Many states especially monolingual English-speaking countries have not taken issues of linguistic or cultural diversity seriously. They have colluded with the racialisation of multiculturalism because it was viewed as a way of ensuring that social diversity was seen as merely a result of post-Second World War migration, particularly for people who were migrating from countries which had been previously colonised. For instance, in Britain, statements, like the ones made by the Department of Education and Science

in 1965, in the 'School Curriculum' document that 'our society has become multicultural', could only be explained as an attempt to ignore the more complex issues. In official governmental documents the questions about the historically based multicultural nature of British society were not followed up (Gundara, 1993, pp. 18–31). If one uses the taxonomy of linguistic, religious, social class and territorial (Hans, 1949) indices of diversity, then British society has historically been multicultural. The devolution of power to Scotland and Wales, which has largely been peaceful, is evidence of the historical multinational nature of the British state.

Intercultural educational policies in European countries until recently have been informed by a century-old history of international and local perspectives (CIDREE, 2002). Within this diachronic dimension, the dominant cultures of Britain and other European states are themselves the products of centuries of past and present interactions between peoples, their cultures and the state. The colonial empires and subordinated nationalities of the European states are an important part of these interactions. Thus, contemporary patterns of social and cultural inequality are underpinned by the historical legacies of nationalism, imperialism and colonialism. These are however, very complex issues for young people to understand in schools and it is important that they are written in a way which is comprehensible to young people in schools (Gundara & Hewitt, 1999).

One hundred years ago, after their near defeat in the Boer War, the English government set up the Inter-Departmental Committee on Physical Deterioration to enquire into the causes of this failure. Almost inevitably, their message was eugenicist, in that the lower orders were 'breeding' and would swamp the so-called 'polite society'. Indeed, the genesis of the social class classification, copied worldwide, was the 1911 Registrar-General's attempt to combat this position. But education was only seen as a means of minimum social inclusiveness. On a positive note, the provision of school meals for all was recommended by this committee.

Deficit and disadvantage models have continued to inform intercultural educational measures. In Britain this meant that those from social classes 4 and 5, using the Registrar-General's classification, were considered 'culturally deprived' or 'culturally disadvantaged'. The conservatives in this debate have continued to postulate an inferiority based on genetic factors. The liberals have tended to stress that the disadvantaged were the result of past discrimination on sex, race or class group. The IQ debate on both sides of the Atlantic has further continued to generate controversy, while in the ex-Communist states, policies to deal with minorities as being defective and therefore requiring special schools have disadvantaged children from the Roma and other minority communities (Tomasevski, 2003; Wilson, 2002).

This legacy of social inequalities formed the backdrop of the riots in 2000 in the northern British cities of Bradford, Oldham and Burnley. The riots involved both poor whites as well as the blacks, and the inequalities were graphically pointed out in the Cattle, Ritchie and Ouseley Reports (Cattle, 2002; Ritchie, 2001; Ouseley, 2001).

The French Enlightenment resulted in the idea of the 'nation' which was based on a social vision of society, and following the French Revolution, was based not on the ideas of some biological myth of ancestors but on the notions of a social contract. This nation state included Alsatians and Occitanians, who did not speak French, as well as

Jews. With the abolition of slavery in San Domingo, black African peoples were also considered to be 'citizens' (Amin, 1997). Hence, the nation was not an affirmation of the particular but an expression of the universal. While the securing of human rights was one of the core objectives of the French Revolution, the rights were applied selectively, with women being denied full citizenship rights. The assimilation of 'other' peoples and the abandoning of local languages in favour of the French language were additional indicators that the nation state was to take priority. The role of building the modern French nation around the new cultural and linguistic unity was assumed by the school system under the Republic. The legacy of officially nullifying and overriding differences has had manifestations in the twenty-first century. In 2005 and 2006, French cities were rocked by riots of young, poor, and disenfranchised French citizens, largely from minority and North African backgrounds. Demonstrations in nearly half of the 88 French universities have been indicative of the underlying barriers to equity and the rates of unemployment reaching 21.7% for the under 25. These rates are high for those who are black or wear head scarves (*The Guardian*, 10/3/2006). The challenge for educators is how to use this complex legacy of the universal and the particular, which provides substantive basis for citizenship, within the unequal nation state. In the economically unequal societies the basis of difference is a barrier to developing notions of similarity and mutualities based on greater levels of equality. The riots in France in 2006 and 2007 represent a watershed warning to ensure that integrative public and social policies, including education, are essential if social and educational inequalities are to be reversed. The Chirac government did not take these events seriously enough and the death of two young people in Villiers-le-Bel have been worse than the riots of 2006 and spread to Toulouse. The author of this chapter on behalf of the Evens Foundation presented an Award for work on intercultural relations one week before the riots (Even Foundation, 2007). The school in and of itself is not sufficient to tackle social exclusions at the wider level. In other countries like Britain there is also a legacy of such divisions and divides, and issues of institutional racism are now very high on the agenda with the implementation of the Race Relations Amendment Act (2000) which requires both public and private institutions not to discriminate. The question is whether these measures are sufficient or they too weak? What are the other things that most states ought to be doing in public and social policy and practices to reduce discrimination and remove high levels of inequalities?

Future for Intercultural Studies

The largely peaceful and democratic transition to devolution in Wales and Scotland suggests that there is a positive role for interculturalism, especially as the Scottish and the Welsh peoples recognise their own treatment by the dominant English nation. Yet, public and social policies and practices are necessary to avoid the ghettoisation of communities. This is the case because both have guaranteed human rights legislation and follow a constitutional path in dealing with minority communities and especially their linguistic rights. Nevertheless, one cannot be sanguine that in devolved polities like Scotland there is no racism. A report commissioned by the Scottish Executive

indicated that 25% of Scots were racists and about half of them did not consider the use of terms like 'Paki' to be racist (Commission for Racial Equality, 2002).

There are also lessons to be learned from the conflict and conflict resolution in Northern Ireland which now has the potential of bringing British and Irish politics closer together after the recent political agreements. The Centre for Cross Border Studies has been bringing together educators from both the north and the south to develop greater levels of practical institutional and educational cooperation. This is not an easy task because politics and identity issues still play a powerful role. Hence, students from the north see the south as 'a different country' and want to complete their education 'on the mainland', while the other sees the north as 'not quite the same ... it's easier to stick with people you know best' (Centre for Cross Border Studies, 2007).

Concepts and analyses need to be developed which draw upon the historical and contemporary aspects of conflict and cooperation in socially diverse societies and which are relevant in developing an inclusive curriculum, and intercultural citizenship education. Within complex societies where technological changes may be leading to high levels of unemployment, greater stress needs to be placed on citizenship engagement with democratic institutions. The need to deepen democracy entails a critical appraisal of issues of societal concern and the development of community participation as well as curricular and pedagogic changes to enhance such collaboration.

Also, it is not only what children are taught and what they learn but also their actual experiences at school, which contribute to their understanding of their rights and responsibilities as future citizens. So, a democratic school ethos is important and this needs to be experienced through active citizenship and engagement in the context of the wider community. For the older groups the role of youth work, further and other formal and non-formal life-long learning are all important in ensuring that sustained educational experiences enhance the skills, knowledge and abilities of citizens and capacities to improve their life chances in the context of diverse communities (Bourne & Gundara, 1999).

Barriers to Equity

In many societies another dilemma needs to be dealt with, because the old solidarities based on social class as antecedents of a class-divided society, whilst providing a clear role for different groups in society created the divisions between classes that have been the subject of confrontations over the last 150 years. The divides based on race, religion and gender have led to the creation of 'seige mentalities' and siege communities which thwart the safety and security of many communities around the world that have become socially divided. Instead of social cohesion in these liquid times as Bauman describes them, the communities are becoming divided (Bauman, 2007). Now that there is no preordained class basis to solidarity the younger generation is faced with much clearer patterns of polarisation by being divided into winners and losers without any class referent. This poses a new challenge for intercultural education because of the exclusivity of identities. Of course the reverse is also true if the winners refuse to acknowledge any debt to society especially as groups from different backgrounds do not share solidarities or a set of resemblances. Intercultural education, therefore, has a

complex role of addressing the sense of exclusions and loss amongst all young people and creating a sense of shared values and citizenship.

In countries like India and the United States policies of ‘positive discrimination’ and ‘affirmative action’ were enacted to provide equity to the hitherto disadvantaged groups. Over a longer period of time these groups are now perceived as being privileged and are perceived as such by the dominant groups. Hence, unless such policies are carefully devised, target actually disadvantaged groups and have limited time span, they become counterproductive by exacerbating differences and reducing features of commonality amongst different groups. This, therefore, presents a challenge of rethinking of policies like affirmative action or positive discrimination so that they do not exacerbate differences and have divisive implications but develop policies that include the disadvantaged from all communities, including those who are poor from within majority or dominant communities.

If some groups are excluded from or marginalised within the education system and schools due to lack of social cohesion, should the state stay neutral or should it intervene? In other words should the state be fair or impartial? Rawls using the difference principle argues that the better off should not have special advantages than the worst off (Rawls, 1997). So to accord equity, the state is ‘fair’ but not impartial. In a democratic state, citizens should have access to education and knowledge in order to equalise their life chances. If the state remains impartial it cannot create level playing fields in educational terms. It can only do so by intervening. The state, however, is not the only agency in this sphere of social change. The private sector has social responsibilities and the voluntary agencies themselves have a powerful role to play in the development of active civic citizenship at the grass roots and community levels. This is especially the case, if the communities are to harness all the local resources and develop micro-economies to enhance the local economies (Pike, 2003).

One of the challenges for education systems and the diverse communities is to build inclusive polities, which can accommodate notions of differences. This could be achieved by:

- Creating conditions for equity and belongingness of diverse groups from an educational perspective
- Developing integrative mentalities based on difference not as disadvantage, and lessening levels of inequalities and providing multiple options
- Education systems building a set of mutualities amongst multi-divided groups in society so they can have ‘ownership’ of these affinities
- Policies to bridge gaps between groups at different levels and nurture notions of human rights and citizenship for the disenfranchised and excluded groups
- Inclusive affirmative action and positive discrimination and time-limited policies
- The development of universally inclusive feminism especially to ensure equity in public life and public institutions
- Diverse communities need to become active citizens and develop CAN DO mentalities and action

Centric Knowledge

At an even broader level these issues raise problems of centric knowledge, which according to COD 1990 is defined as ‘having a (specified) centre’. There are however, multiple sources of knowledge and there are many narratives and not a singular narrative about knowledge and hence ‘centric’ knowledge systems operate on simplified and exclusive criteria of official school curriculum. The criterion for selecting the curriculum from multiple sources in diverse polities presents a complex challenge to curriculum planners. This is especially the case because a curriculum centred on knowledge of dominant groups does not serve the needs of socially diverse polities. A non-centric or an inclusive curriculum which draws from different sources is needed within national, regional and local contexts (Gundara, 2000, pp. 161–205).

One of the problems in the implementation of intercultural education is that the languages, histories and cultures of subordinated groups in Europe are not seen as having equal value with those of dominant European nationalities. Such an entitlement to a non-centric or inclusive curriculum is perhaps one of the greatest challenges to actualising the development of an intercultural education. This exercise would entail a major intellectual challenge, as was the case when UNESCO undertook to write the history of Africa in an eight-volume series. The series largely has not been integrated within the main body of universal historical knowledge. There are also other important UNESCO projects on the Slave Trade, The Silk Route, The Culture of Peace and Education for International Understanding which have implications for developing intercultural education within the mainstream of national educational systems.

UNESCO proposes in the Guidelines on Intercultural Education over the next biennium to:

- Contribute to the improvement of curricula and textbooks for the teaching of history
- Promote dialogue on the role of language and culture as key factors in the development through education of understanding among people within and between Member States
- Support the educational activities of the International Decade of the World’s Indigenous People
- Disseminate new approaches to language education
- Support the production of guidelines on mother tongue and multilingual education
- Encourage the preparation of culturally appropriate materials in local languages

This UNESCO agenda should enable countries in Africa, Asia and the Americas to address issues of societal diversity through intercultural education policies (UNESCO, 2006). To maintain safety and security within their diverse polities, states in these continents need to develop curricula that avoid centrisms of their own. Devising the necessary basis of knowledge in a national and civilisational context presents curriculum planners with a difficult but essential challenge. Shared knowledge and habitué

can assist in the process of the development of shared and common democratic value systems in the public domain and public institutions.

A non-centric curriculum would enable teachers, students and other learners to develop the inclusive and shared value systems which are necessary for the development of democratic societies. For instance, in Taiwan the democratic cultures and the education system are able to withstand pressures of not teaching the superficial notions of Asian values. As Amartya Sen states:

An attempt to choke off participatory freedom on grounds of traditional values (such as religious fundamentalism, or political custom, or the so-called Asian values) simply misses the issue of legitimacy and the need for the people affected to participate in deciding what they want and what they have reason to accept. (Sen, 1999)

Intercultural Learning Societies

One aspect of the curriculum, which illustrates the issue of knowledge centrism, is the teaching of the history curriculum. The teaching of history from an inclusive perspective needs to be developed at a much wider level internationally. In Europe one attempt has been made through the Tbilisi initiative of the Council of Europe in Armenia, Georgia and Azarbijan. Similarly, given the political agreement in Northern Ireland, are there ways in which the selective memories of the 1916 rising in Dublin and the Battle of the Somme be taught and learnt by both the Catholics and Protestants to give shared educational substance and meanings to the recent political agreements? Such curricular developments should not only be part of mainstream education, but also build on the basic education and the acquisition of histories. Such an integrated system would enhance the intercultural competencies of active European, African, American and Asian citizenship within multicultural democracies. Subjects like the humanities and the social sciences particularly need to be appraised for their relevance to the contemporary needs of societies.

This is especially the case because 130–145 million people, at least, live outside their countries of origin. These figures would be higher if undocumented migrants were included. Over 21 million refugees live in other developing countries. Many subsist in ‘twilight zones’ and border areas of state boundaries and continue to remain ignored. Many young people grow up in these violent and displaced areas with no hope for a meaningful future within either one or the other state. The Afghanistan-Pakistan border and the Burmese-Thailand borders represent the ‘twilight zones’ and they are indicative of the permeability of borders and the lack of a singular regime of law and national institutions. Sassan explores the complexity of the border issues with the emergence of the global capital and electronic market and their implication for national borders (Sassan, 2006).

The development of an inclusive educational provision and a shared and meaningful curriculum is necessary for the creation of future belongingness to stable communities. Such

educational initiatives may help to provide these young people with bases to understand the meaning of democratic processes, modernisation and development. Such issues ought therefore to include relevant consideration of participatory pedagogies. In marginalised communities learning and teaching should be progressive and not constrained by a reactive traditional African, Asian and American-centric curriculum, which tend to inhibit questioning. This in turn allows Euro-centrism in knowledge to prevail and perpetuate its dominance at the global level. In reality, it is both the dominant and the subordinate, the majority and the minority, which need to define new dimensions of knowledge to make the futures more comprehensible (Gundara, undated).

To install the 'voice' of the disenfranchised in the curriculum will require a great deal of delicacy, diplomacy, persistence and sophistication, particularly if the desired changes are not to be relegated to the margins of academic life. Reactive, rhetorical and rebellious responses in curricular terms are not only inadequate but also counter-productive. While action is needed across all European, American, African and Asian societies, those in the poorer parts of these continents have greater levels of difficulties, and may require support from international agencies. Hence, the more affluent and experienced educational agencies like the European Commission and UNESCO, and its regional centres, can also be helpful in lending them non-directive support for educational change and development.

Secularism and Religious Armageddon

In historical terms Emperor Ashoka (BC 272–232) was driven to remorse by the slaughter, death and devastation his conquests had caused in India. This made him turn the victory column to a column of peace and non-violence. This historical example is indicative of many contemporary monuments which carry similar messages. These monuments are used by teachers and schools to deliver messages of peace rather than those of war, which most of the columns in squares of cities all around the world largely represent.

If one walks out of the UNESCO headquarters in Paris, into the Place Joffre in the Eiffel Tower Park there is a monument to peace. In Tavistock Square, London there is a monument for Mahatma Gandhi and the victims of Hiroshima and Nagasaki atomic bombs. After the bombing of a bus in this Square on 7 July, it is also a monument to those who died there more recently and it has a more poignant meaning to those who live and work in the Bloomsbury area and the whole of London. These are two of the many sites and symbols in Paris and London amongst those in other cities around the world which educators can use to teach about democratic, non-violent, peaceful and inclusive secular states. There are other monuments which share grief caused by national traumas include the Yad Vashim in Jerusalem, the Vietnam Wall in Washington and the Okalahoma City memorial. These symbols provide examples of the ways in which grief and being a victim are selectively portrayed and need to be used to read the stories of the past critically which help to disarm history. Most monuments, however, only continue to mark the triumph of one group and the Valle de los Caidos continues to celebrate Franco's victory and not commemorate the death of all who died in the

Spanish Civil War. Most educational materials also continue to represent the voices of the victors, the powerful and the dominant. There are, however, currently projects which deal with re-examining the ways in which textbooks have been written as well as the ways in which names on maps have been exclusive and not representing complex pasts. The Eckhart Institute in Germany and UNESCO have devoted time and expertise to these initiatives.

The tensions between secular and religious ideologies perhaps raise the gravest warning to multicultural and multi-faith polities and need to be addressed by educators and curriculum planners in a non-nationalistic and creative manner. While religion and personal beliefs may belong to the private domain there are issues from religious systems and knowledge, which can impinge on the national and global minds and the development of critical and democratic citizens of the future. It is a matter of grave importance that the role of religion in multi-faith, constitutional and democratic states is clearly defined to avoid being led to a societal abyss by fundamentalist and dogmatic notions of 'truth' fuelled by faith.

The importance of Gandhi and his protégé Nehru is that they had a genuine intercultural understanding of Western and Indian civilisations. They personified a creativity and determination which is currently lacking in many political and educational leaders. The ex-President of Tanzania Mwalimu (teacher) Nyerere, was usually simply called teacher and through his policies he unified the multicultural Tanzanian society. Perhaps, it is in his footsteps Nelson Mandela has formed a group of Elders which include former leaders and Nobel Prize winners and they may help provide influence to resolve intercultural conflicts and other crises in the casino of the unregulated global market. How can these initiatives be used by the educators to enchant the disenchanting with inclusive, democratic and active engagements?

At the underlying level a question has to be asked about the educational implications of President Mbeki's 'African Renaissance' and what role the academic institutions will play in it. Unless it is able to build a more equitable and inclusive South Africa the Renaissance will remain a chimera (*The Observer*, 24/11/2007). There is also a question about how much the rise of fundamentalism is also a result of the failures of governments to modernise societies and provide equity in public and social policy generally. If governments are failing in this role there is not much that the education systems can do in muting religious conflict.

In Nigeria, Wole Soyinka regrets the way in which the proselytising religions are eroding local traditions and faiths like the Orisa, and also disrupting education within schools and universities (*The Guardian*, 6/8/2002). In the West African context, the implementation of intercultural policies and practices may be one way of avoiding religious strife in educational institutions.

At the academic level, scholars such as Inayatullah in Pakistan and others argue for an alternative social science, which is not based on the nation state as a model of analysis but on notions of a 'layered sovereignty' (Inayatullah, 1998). Inevitably it poses complex issues not just for educational policy but also for curricular reform in deepening and raising the quality of education.

The Role of Media and Intercultural Relations

The media have an important role to play in enhancing intercultural relations because of their power to mislead or to educate. However, during the current period of globalisation the media have been constrained by market forces as far as programming is concerned. For many people in the world the media may be a more influential source of information than the classroom. When not concerned with redecorating or tidying the garden their focus has shifted to the exotic, travel and wildlife programmes instead of programming about development, poverty, intercultural issues, politics, history, economics or the environment (Nason & Redding, 2002). These issues only receive perfunctory treatment as part of news and current affairs programmes. However, such programming ought not to be paternalistic as it was in the past and ought to address issues to ordinary citizens.

Televsual audiences are largely committed to entertainment and do not watch documentary programmes, which either lecture or hector them. Viewers prefer a story, a good narrative and strong characters. At least two sets of actions may be necessitated. Firstly, the media and communication industries need to adopt a strategic and integrated approach, which is discourse- and content-strengthened. How can various forms of new media be used in teaching and learning? On issues of intercultural understandings, educators at all levels have a major role to play in using the media for educating viewers not only to become visually literate but also to acquire a critical understanding to distinguish between hype, rhetoric and productive or progressive discourse.

The Role of Intercultural Teacher Education

Teacher education institutions have a continued and major role to play in enhancing intercultural education because as multipliers the teachers educated by them affect the lives of many generations of those they teach.

In many countries around the world teacher educators need to revisit the Carnegie Foundation's Report of 1986, which recommended making the teaching profession a high status profession and on a par with other professions. Most higher education institutions both educate and train doctors, architects and lawyers but only train teachers. This is an important issue because there is a difference between 'training' and 'education'. Higher education institutions cannot ignore the same broadly based rigorous education for teachers. If the Harvard Business School, as Professor Colin Power former Director of Education, UNESCO, in a lecture at the Institute of Education University of London pointed out, educates barracudas, then teacher education institutions should not merely train teachers as social workers to pick up the pieces that the barracudas leave behind.

The key question is whether the issues are about teacher training or teacher education. 'Training' implies a lower order of knowledge and skill.

In order to get the best educated and professionally qualified teachers, their education should be undertaken at universities or institutions with comparable standards.

Teachers, therefore, as autonomous professionals should join a teacher education institution after an undergraduate degree, and have a professional education similar to those in other professions (Carnegie, 1986); of course the circumstances do vary in different countries.

A high level of professionally and rigorously educated teachers who have a post-graduate accredited qualification is essential to raise the competences of the teaching profession. As a part of this accreditation there is a need for intercultural dimensions of courses to be built into the teacher education process. This in itself raises some complex issues. Students from minority communities who have done well at university tend to join other professions and not the teaching profession. Yet to make intercultural teacher education effective both teacher education institutions and schools need to have a diverse student body and teaching members of staff. Not only does teaching have to be made an attractive profession but education of the underclass, minority and smaller nationalities needs to be improved, and measures instituted to ensure that a number of them do join the teaching profession. One of the advantages of interculturally educated and a multicultural teaching force is not only that it enables the negotiation of complex social values in schools and higher education institutions but also provides multilingual skills and knowledge for competent and professional teaching force.

In intercultural terms teacher skills ought to include expertise in interpersonal relations, the conduct of conversations, moderation of difficult discussions, dealing with conflicts and working with parents. Teachers confront the most complex task of tackling student racism and autonomous peer cultures. The need for communicative skills can only be met if teachers have the necessary experience and skills and understandings which cut across student–teacher and school–community divides.

Teachers can acquire knowledge, skills and understandings to deal with racism during their initial teacher education, which needs to be further refined on a continuing basis as part of their professional development. The complexity of the processes, of racism and class-based exclusions as well as the lethal mixture of these with religious divides demands a high level of skills and professionalism. It also demands institutional policies and support within schools. Teacher education institutions have a fundamental role to play in unpicking these complex issues and enabling all teachers to deal with them competently.

Communities of Development and Hope

One of the main reasons for developing an inclusive democratic framework is the fact that 10,000 distinct societies live in 200 states and may be denied equity and protection. The International Commission on Education for the 21st Century set up by UNESCO placed the issue of learning to live together not only as one of the four pillars of education for the future but as the greatest challenge facing education.

Both formal and informal lifelong learning has a major role in developing intercultural understandings among citizens in socially diverse societies. This needs to involve the non-governmental sector so that citizenship in such societies does not remain passive. It requires citizens to become active so that they can improve their own and their communities' lives for the better.

However, unless there are concerted efforts to develop democratic engagements and build ‘communities of development and hope’ intercultural conflicts are bound to increase. The creation of active citizens in poorer communities can only take place if there are deeper intercultural engagements both within and outside educational institutions.

Democratic and shared political cultures go hand in hand with greater levels of legitimate economic activities for all communities. Income inequalities are associated with increases in education and social inequality. From amongst the OECD countries Britain has the largest income gaps and the highest proportion (19.4%) of young people aged 16–19 who are neither attending school nor employed. Many of these young people are not only functionally illiterate and manifest anti-social behaviour but are also a threat to the security and lives of others. The thwarted ambitions of these young people form the basis of grave intercultural conflicts. A massive effort is necessary to create the preconditions for safer and securer communities in Britain as well as most other countries of the world.

In many of the crises referred to in this chapter there is an essential role of education as part of public policy provision to proactively deal with inequalities of educational opportunities and outcomes in multicultural societies. Educational initiatives based on currently developed policies and practices can also help in creating a new society which not only recognises differences but also helps in developing commonalities and shared citizenship values that can provide futuristic legitimacies in confederal communities.

FEMINISM, LIBERATION, AND EDUCATION

Nelly P. Stromquist

Unquestionably, feminism will be seen by historians as one of the strongest social movements of the twentieth century. Ideas that the rights of women should be included among the rights of all people existed as a coherent set since the late 1860s and culminated in women's right to vote in the early twentieth century, with New Zealand being the first country to grant them that right. However, it was not until the 1960s that the feminist movement spread out to the corners of the globe. This effort, now called the "second wave" of feminism, endorsed the term "liberation" and sought to free women from economic oppression, cultural subordination, and political marginalization. The second wave documented the situation of men and women at all levels of society, from the household to the place of work and government, and concluded that it had to change to make both women and men benefit from those social arrangements. Liberation, in other words, implied a political movement toward changing the social order, but in ways that meant not the replacement of men by women in the existing hierarchies but the creation of other kinds of social relations, less characterized by rigid and arbitrary hierarchies. The ultimate goal was not always stated but it often involved the reduction of social differences between men and women.

Feminist groups today comprise various kinds: those that fight patriarchy, those that engage in academic and cultural production, groups that are pro-human rights, and community-based organizations working on the satisfaction of basic needs of poor women. They have been unified in the past by universalist approaches to human development and social justice. Many scholars recognize the family and the body as sites of the politics of power (Molyneux, 1985; Connell, 1987; Messner, 1992). Most recognize the issue of domestic and sexual violence as a deeply rooted feature of women's subordination and a growing set considers the recognition of sexual orientation – all issues linked to social change and national development (Subrahmanian, 2005).

Liberation in the early days meant moving away from definitions of women as weak, docile, passive, with mothering instincts and responsibilities, assigned to caring tasks, and responsible for the general functioning of the household. It also meant moving away from dependence on men due to low salaries, temporary employment, and dead-end jobs. A goal not envisaged initially was the freedom of sexual orientation; another goal, which came to divide the movement in many countries, has been control over one's own body, which includes abortion rights. Today, liberation as a mantra has

been lost, as different types of women have emerged and see reality in different ways and may seek different goals. Lazar summarizes the situation well when she states: “Gender oppression is neither materially nor discursively enacted in the same way for women everywhere” (Lazar, 2005, p. 10).

As action has followed new ideas, it has become manifested in four separate arenas: the efforts conducted by women themselves in their various terrains of social life; the lines of action undertaken by international development agencies – of critical importance for developing countries; the public policies enacted by governments in response to feminist and global pressure; and the theoretical and analytical work contributed by feminist researchers in the academy.

Globalization trends, with the shrinking of state-provided social services and emphasis on market forces as the best processes for social functioning (Krieger, 2006; Arrighi & Silver, 1999; Falk, 1999), have contributed to the weakening of feminism. Intense competition between firms as well as between individuals does little to foster social solidarity. Furthermore, harsh economic conditions among poorer populations, particularly in developing countries, demand time and effort for one’s survival that cannot be sacrificed for community or altruistic work. Consequently, women activists find increasingly difficult environments in which to operate. In the academic work, another group of women, those who are sympathetic to the feminist cause, have become more immersed in theoretical constructions in which power and material conditions take second place to cultural issues as explanatory variables. There is an increasing distance between feminist academics and women activists in NGOs. The latter include many more women from developing countries and are interested in such issues as poverty, trade, debt, and human rights. They work in independent organizations and community-based organizations that either specialize in gender issues or address broader development issues such as poverty and human rights. Women in some academic disciplines approach gender as a subject of interest, not as a dimension of political transformation (Mohanty, 2006). Their work, consequently, is not linked to a movement that seeks intervention in the political arena by pressing for specific policies or bringing women to political office so that they represent women’s interests.

This chapter considers how theoretical thought about gender and education has advanced in recent decades. To do so, it begins with a discussion of women and men’s education, then presents the various strands of feminist thought, and finishes with a discussion of what might constitute effective interventions, given the lessons learned over time.

Conditions of Women and Men in Education

In the early 1970s, when looking at the situation of women’s education, the general concern was for their access to formal education, especially primary and secondary education, two basic gateways to advanced knowledge. Girls’ access to schooling was lagging behind that of boys, especially in developing countries; thus, a crucial education objective became parity in access to schooling.

Over time, indeed, there has been an improvement in the proportion of girls attending primary and secondary schools although it is not clear that this is the result of specific governmental strategies or rather the collateral effect of expanding access to formal schooling by establishing more schools or moving them into shorter daily shifts so they could accommodate more students. Girls' enrollment has indeed been edging toward parity with boys although at the global level girls still represent 46.5% of the primary enrollment. Inequalities are greater in South and West Asia, the Arab States, and sub-Saharan Africa, where girls constitute 44.1%, 46.0%, and 46.5%, respectively (UNESCO, 2003). About 115 million children of primary school age were not enrolled by 2000, with girls representing 57% of those out of primary school in developing countries, particularly in Pakistan, Nepal, and India. Secondary school enrollment has also been improving though in the majority of countries women have not reached gender parity. In tertiary education, the picture is reversed, with higher male enrollment in 24 countries but higher female enrollment in 72 countries – an outcome that suggests that women finishing secondary schooling have a greater chance of moving into further education than men. On the other hand, university enrollment by field of study shows still a strongly gendered pattern, which raises the question of whether it is by personal choice or is rather the consequence of cultural and social beliefs and expectations about occupational roles for men and women. Substantial and persistent differences also exist between urban and rural educational enrollment – a reflection of development models that exploit the rural areas while benefiting the urban population. Yet, within these geographical areas, women constantly stand as inferior to men in educational attainment – further corroboration that gender disparities operate irrespective of location and wealth (Stromquist, 2007).

One wonders why women have been gaining greater access to education. Perhaps what is at work is more the widespread notion that the modern citizen in general needs education rather than specifically that women need education to transform their lives. Some observers consider that another reason might be that basic education is increasingly seen as a global public good, but this explanation would be limited to the wealthier nations since at least in 101 developing countries charge school fees at the primary level (UNESCO, 2003), a practice made necessary by the low budgets allocated for public education, caused in turn by structural adjustment programs, imposed by international financial agencies.

Some governments have taken statistics on access and completion as indications of their efforts to achieve gender equality. This is almost always an erroneous claim because equality of opportunity as a policy calls for specific measures to help a targeted group. Unless there is evidence that particular efforts were deployed to facilitate women's access to formal schooling, equality of opportunity cannot be assumed to have been a conscious state effort. Educational budgets in most countries rarely consider funds or personnel for gender-focused strategies.

Feminist ideas in education in the mid-1970s examined issues of access and practices in the classroom. They also addressed gender inequalities in terms of field-of-study choices and expressed concern with the lack of effort to question the messages that lead girls and women into those choices. With the passage of time, among feminist thinkers, there has developed an increasing realization that access to schooling and

successful completion, important as they are, do not guarantee that ideological beliefs about gender will change. Numerical gender parity may have little to do with cultural, economic, and political change. For instance, we need to interrogate ourselves, what has it meant to have more women doing better in access and retention in high school in Latin America and the US? Research studies do show that educated women do better than uneducated women in the labor market and in a number of social situations and decisions, yet detrimental notions of femininity and masculinity are imbued in society and affect most women, regardless of educational levels.

Aided by an extensive critical theory on the nature of schooling as sites for reproduction of social classes and hierarchies, feminist educational theory recognizes schools as sites where cultures and subcultures are created and in which systems of gendered power and gender meaning-making are maintained. By looking at school access as an end in itself, one becomes oblivious to the substantial gender differentiation that occurs through schooling, particularly in the creation of notions of masculinity and femininity. Access as an objective implies that schools are neutral environments for everybody and that those environments do not create gender hierarchies and differential treatment of girls and boys within classrooms and schools.

Girls' access to education remains a critical problem in parts of the developing world, especially in sub-Saharan Africa and in West and South Asia. In many developing countries, serious gaps exist in girls' access in rural areas. On the other hand, in a growing number of countries, girls are moving toward parity in terms of school access and they show a tendency toward greater success than boys in completion of primary and secondary education. Unfortunately, a number of governments are conflating equality of access and completion with gender equality, which leads them to assert that there are no gender problems in their respective societies.

Changes in Textbooks and the School Environment

Regardless of whether one adopts a feminist position or not, the relationship between education and democracy involves two aspects: how the educational structures and practices promote democracy in society, and to what extent schools function democratically (Perry, 2003/2004). The first implies access to school and learning and the second how practices in the classroom foster tolerance, recognition of the other, human rights, and democratic agency.

Important messages are assimilated through textbooks; therefore, feminist attention soon centered on these and, as a result of this interest, educational materials have been improving over time. Across most countries, there has been a reduction in the use of sexist language (usually expressed in the use of the masculine form as the key referent) or (in languages where this is applicable) in using only masculine pronouns for occupations and roles that can equally be fulfilled by women. Problems with illustrations, historic figures, and depictions of certain characters in stereotypic ways with women as mothering, sweet, abnegating and men bold, leading, intelligent, remain but they are certainly fewer than they were in the early 1960s.

What remains problematic in textbooks and curricula is the absence or the partial treatment of subjects central to altered conceptions of gender. Increasingly, schools

offer more programs dealing with sex education. Yet, their approach to the subject continues to be one based on anatomy, physiology, and the threat to health that sexuality poses. Very few are the programs that deal with sexuality, sexual orientation, gender and citizenship, gender-based violence (domestic violence, sexual harassment, rape, prostitution, pornography), and legal rights among others.¹ Seldom do they include this knowledge within the treatment of social studies or citizenship education (Arnot, 2006). Consideration of sexual abuse and sexual violence occurring within schools is notoriously ignored. In short, significant improvements could still take place in the content of knowledge and the context in which it is presented in school system. The curriculum still favors male knowledge and continues to convey the notion of women's comparative advantage in the domestic sphere.

Public Policies: Global and National

It has been through action at the international level, first through feminist organizations in industrialized countries in close alliance with feminist NGOs in developing countries, and later through the action of UN organizations, that significant attention has been given to women's and gender issues. A notable piece of global legislation was the enactment of the UN Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW). First adopted in 1979, CEDAW had been ratified by more than 180 nations by 2006. During the 1990s there were several international conferences that further placed the issue of women's advancement on the public agenda. Notable among these conferences was the 1994 International Conference on Population and Development (held in Cairo). All of these conferences highlighted the importance of women's education and the imperative for girls and women to have equal access to education. The Fourth World Women's Conference (held in Beijing in 1995) adopted an educational plan of action that revealed sophistication in defining educational issues and proposed a very complete set of measures to deal with gender issues in educational systems. This document has been signed by virtually every nation in the world.

UNIFEM, UNICEF, and UNESCO have emerged as major advocates of women's issues. A number of bilateral agencies focusing on national development have also adopted substantial programs of action to advance women's conditions; notably among them are the Swedish, Norwegian, Dutch, and US development agencies. Major international lending organizations, such as the World Bank and the various regional development banks, such as the Inter-American Development Bank, have also become active in promoting consideration of women and gender in national development.

It has been the commonalities among women regardless of class, ethnicity, race, and age that have led to the formulation of public policies on gender and the justification of intervention. Since the adoption of public policies implies a role for the state, it has been liberal feminism – building on the notion of equality of opportunity – which has promoted these policies. Liberal feminism centers on individual rights and endorses an unproblematic view of agency, assuming that women have the autonomous capacity to modify existing relations. It is also optimistic about state behavior and assumes that the governmental machinery as well as the power of the law will be used to advance women's issues.

Public policies – and official discourse as well – have shown confusion between the concepts of equality and equity. While in the social sciences, particularly in education, there is an understanding that equality is the presence of identical conditions in certain social indicators (e.g., salary, political representation, access to university) and equity the measures taken to reach equality, several international organizations and national governments use the terms indistinctly, thus conflating desired outcomes with means. Subrahmanian (2005) suggests that equality be used to indicate parity and equity the result of “actions to translate equality into meaningful distributions of resources and opportunities, and the transformation of the conditions in which women are being encouraged to make choice” (Subrahmanian, 2005, p. 29). To this helpful definition, one could add the notion that, while equality may be the final objective, equity by force requires measures to intervene and that these measures require specific identification of groups to benefit, financial resources, and the allocation of personnel to accomplish the anticipated tasks.

Moreover, while education is essentially a form of social distribution (i.e., giving people certain forms and levels of education), equity in education involves some form of *redistribution* insofar as it involves the reallocation of goods or services so that the intended beneficiaries obtain more or a better good or during a longer or better service. Most gender policies build upon distribution rather than redistribution strategies.

Two current global policies that address the intersection of women and education are Education for All (EFA) and the UN Millennium Development Goals (MDGs). Enacted in Jomtien in 1990, EFA was restated in Dakar in 2000, following limited achievement of its stated goals. EFA calls for universal access to basic education for both boys and girls by 2015 and gender parity in primary and secondary education by 2005. The MDGs (approved in 2000) incorporate these two EFA goals and add the objective of women’s empowerment, in which women’s power is equated to parity access to education, participation in the remunerated employment, and their proportion in political representatives. The MDGs are backed by international financial organizations and the UN itself; as such they stand to be more fully implemented than EFA. Several feminist writers have noted with concern that the MDGs reduce the definition of basic education to four completed years – something that may be high for certain sub-Saharan countries and perhaps West and South Asia, but is low for East Asia and Latin America, where higher levels of education have already been attained by both girls and boys. According to UNESCO (2003) 60% of the 128 countries with data available for primary and secondary indicate that they are going to miss gender parity at primary and secondary levels by 2015.

Both the EFA and MDGs documents are infused with a discourse of equality and empowerment, but concrete action to move away from negative situations is missing. While assistance by international development organizations to basic education increased from 0.1% from their total in 1993 to 2.2% in 2002 (EFA Monitoring Report, 2003), action at the national level is either lacking or weak. For instance, though EFA agreements call for the production of plans of action by EFA country signatories and the subsequent implementation of these plans, very few countries have complied with such promises. By June 2005, the web site of UNESCO reported that national action plans existed in only 43 countries. Follow-up activities on MDGs objectives have

also been slow. In early 2006, UNIFEM reported that only 55 countries had presented their required annual progress reports. Global public policies in education (and other sectors as well) rarely include women's groups or feminist academics in the elaboration of objectives and procedures to reach them, with the exception perhaps of the participation of FAWE in the African region. However, to attain gender equality the participation of women through transformed basic rules, hierarchies, and practices of public institutions is necessary. Women therefore have to be present in public spaces where debates about a new governability are elaborated (Guzmán, 2003).

The move toward global economies, with rapid advance in technology as a facilitator, has created a hypercompetitive context for economic growth that has resulted in the intensification of hegemonic masculinity. It has resulted as well in the continued dominance of men in powerful institutions that prevail in the global economy such as the World Trade Organization, the International Monetary Fund, the World Bank, and the US Treasury (Kenway, 2005). Such conditions are not conducive to address gender and social justice. Although today many international institutions express an interest in poverty, their studies and policies rarely consider poor women, who constitute the poorest at every class, race, or ethnic level. On the other hand, when their interest is directed toward gender, they pay attention only to poor women. On the part of the state and its agencies, therefore, there is no proper consideration of how gender functions in society and how it intersects with social class beyond simply low-income women. Summarizing current global trends, Mazur notes that, "symbolic policies and non-decisions, policies without outputs, are a common type of feminist policy" (Mazur, 2002, p. 180).

National Interventions

The enactment of substantial educational policies containing a gender perspective has occurred in several industrialized countries, notably Australia, the UK, and the US. These policies have usually undergone revisions to expand objectives from the prohibition of discriminatory practices in admissions or provision of scholarships and loans to the creation of more girl-friendly environments to protection against sexual harassment and sexual orientation. The successful reform in Australia, characterized by several iterations of educational laws, has been attributed to joint action by teacher unions, teachers, feminist academics who had researched gender issues in education, and activists placed within the education system and other highly strategic places (Kenway, 2005).

Educational policies in developing countries increasingly consider the gender dimension. The prevailing pattern in these policies is to concentrate on universal access to basic education, which is acknowledged as a human right and therefore applicable also to women. These policies respond mostly to issues of access and retention, but do so through the use of statistics rather than a clear intervention to help women. As educational systems expand, women do benefit, usually as a side effect of overall expansion and changes in social mentalities, aided by, albeit contradictory, media messages. The main principle of these policies is equality of opportunity, which focuses

on equal access rather than on equal treatment within schools or on knowledge that will transform gender-domination patterns. As a concept, equality of opportunity faces limitations because it assumes fair rules while not considering that previous and current inequalities would have to be corrected if transformations in the social order of gender are to be attained. Equality of education, from a gender perspective, reduces concern for the ideological context of education, a reduction that tends to reproduce the social relations of gender (Blackmore, 1999). Consequently, many policies show limited attention to teacher training and to the development of new curricula.

A number of small interventions on gender and education have been put in place in several countries, while large-scale educational policies – characterized by greater investment and stability – are much more sensitive to issues of poverty than to gender. A major exception to this pattern is PROGRESA (now *Oportunidades*) in Mexico, which provides significant subsidies to poor families as part of an integrated approach that includes nutrition and health, and offers stipends slightly larger for girls than for boys in secondary school.² Another intervention of significance is the Female Secondary School Stipend Program in Bangladesh, which reached about 500,000 girls by 1995, and provides girls with small stipends to attend and complete their high school studies. Measures that have promoted girls' success in schooling also include the provision of nonformal education, such as those of Bangladesh's BRAC schools in small rural communities, which attempt to enroll at least 70% girls³; the Mahila Samakya program in India to help rural girls; and the Quetta Girls' Fellowship program in Baluchistan, Pakistan, that provides subsidies for private schools to offer basic education for low-income students.⁴ All these programs have succeeded in increasing girls' school attendance and completion, even though domestic divisions of labor have changed little. A cross-national study of three Latin American countries (Brazil, Costa Rica, and Peru) found that educational policies increasingly include gender issues (Stromquist, 2006b). These policies continue to do so primarily from the perspective of parity of access, although progress in the conceptualization of gender has emerged, particularly in Brazil. Overall, there tends to be little attention to the implementation of new practices regarding an empowered citizenship for women or to issues regarding one's body in a social and cultural context.

In part because of the very successful indoctrination that occurs through formal education, schooling is not grasped by the majority of people as an essential and profound setting for the transmission of ideological messages. Mazur (2002) notes that the content of feminist policies among Western governments does not often coincide with any particular current of feminist ideas in Western political thought, and that these policies tend to offer a fragmented incorporation, frequently incorporating liberal feminist ideas regarding the political representation by women and the adoption of women-friendly issues into the political process, and at times adopting radical feminist positions present in sexuality and violence politics (as happens in Sweden and Scotland). Mazur further contributes to the understanding of feminist policy by proposing a typology that identifies democratic representation, reproductive rights, family law, equal employment, and reconciliation of spouses. In her typology, Mazur includes "public service delivery policies", which she defines as those that exist in public services such as health, housing, education, and transportation. This view of education as merely a "public service" and not a major means by which ideologies are transmitted is fairly typical.

Theoretical Understandings of Gender Inequality⁵

Both first-wave feminism (culminating in women's right to vote in the early 1900s) and second-wave feminism (roughly from the 1960s to the present) saw women as a group with little differentiation among its members. Therefore, it theorized subordination and oppression as standing for *all* women. Third-wave feminism (perhaps since the mid-1980s and predominant in industrialized countries) sees major differences *among* women.

Initial arguments about the differential status and conditions of women were attributed to the socialization of men and women into complementary functions or social roles. This line of reasoning, broadly termed liberal feminism, assumed a simple correction in which the state played a major role enacting and enforcing antidiscriminatory laws to modify the sexual stereotyping of women and men. This perspective was later found limited because it perceived gender as acquired preferences and norms and avoided its examination as the expression of power of one group over another (Williams *et al.*, 2004). To a growing group of activists and some feminist academics, patriarchy (i.e., the diffuse ideology across most societies that accepted men's superiority, their cultural and economic privileges, and their responsibilities as heads of household) emerged as a more powerful explanation for the creation of arbitrary dichotomies between men and women, and between masculinity and femininity (Daly, 1978; Pateman, 1988). Connell (1995) introduced the notion of the patriarchal dividend to highlight the reality that all men benefit as a social group in terms of access to symbolic, social, political, and economic capital. The recognition of patriarchal ideologies also led to the studying of the household as a social setting that brings uneven burdens and rewards to its members.

Critical analysis, which assumed greater force in the 1990s, showed that "women" is not a unidimensional category, for gender intersects with other social markers (race, ethnicity, social class, sexual orientation, and age among others) to create compounded ways of experiencing gender, what in 1997 Fraser termed "differences among females". From one perspective it could be asserted that women cannot be seen as a totalizing category. From another perspective it could be argued that gender differentiation occurs *regardless* of the experience of additional and multiple permanent social markers. As political and theoretical work has advanced, it is clear that there is a critical interface between gender and social class, as well as between gender and ethnicity, but that individual- and group-life outcomes cannot be reduced to social class or ethnicity alone. The theoretical understanding that gender inequality is located in a wider terrain of inequalities has had a concomitant challenge in practical action: how to recognize variability in the experience of gender without losing track of gender as a major form of inequality.

Toward the mid-1990s there emerged in industrialized countries a feminist interest in masculinity/masculinities and the education of boys. According to Kenway (2005), this emphasis has been less interested in human rights than in documenting the various manifestations of masculinity and their implications for boys and men as well as for girls and women. Such emphasis has also contributed to understanding gender violence and harassment in much more subtle ways. The description of multiple and intersecting differences and complex subjectivities was often the subject of research on gender and education. A parallel emergence of cultural feminism celebrated femaleness

(Kenway, 2005). In recent decades, gender discussions have moved away from the consideration of power and collective means to achieve change. Thus, while Molyneux (1985) spoke about the practical and strategic interests of women in the 1980s, the discourse moved in the 1990s to intersectionality and performativity, the former referring to the multiple intersection of social markers (e.g., being a woman, white, wealthy, and with a Ph.D.) and the second alerting us that gender is performed in everyday life by our micro-level actions – and thus the implication that gender can also be transformed at that level. Collins (2000), from her Afro-American experience, contested notions of individual acts of resistance and highlighted the weight of structural inequalities such as racism, capitalism, and sexism.

In contemporary feminist work, explanatory frameworks that deal with power, especially those that address the question of nondecision-making and the tendency of the mobilization of bias to block challenges to the prevailing allocation of values and interests – as proposed by Bachrach and Baratz (1970) – are no longer being used. Thus, there is a scarcity of studies concerned with the limited formulation of public policies to modify oppressive aspects of gender. Power, however, is present in all areas of decision-making and in the creation of systems of inclusion and exclusion (Lynch, 2001). Some scholars have challenged the nondecision-making framework and argued that it cannot be tested. In reply, Chilton (2005) notes that such a framework gives rise to two alternative hypotheses: a policy may have been either suppressed expressly or it was foolish to begin with and therefore was not considered at all. However, having a normative position on a given problem does enable researchers to pursue a given issue and trace the attention it receives in the policy arena.

Since the 1990s, postmodernism has brought a great deal of subtlety to the consideration of gender issues. Its main exponents are West and Zimmerman (1987) and Butler (1990). Among the notions proposed by postmodernism: identities are fluid and changing; power is diffused and relational, with micro-power playing crucial functions; performativity or how gender is constructed daily through social reenactment of practices and expectations; and metanarratives present truths from the perspective of those building them. Postmodern thought has been quite influential among educational researchers dealing with gender issues, although certainly there have been criticisms to it: moving away from binary and arbitrary categories such as woman and man sounds reasonable, except that doing so leaves the researcher or the policy-maker without a subject to refer to, much less to defend. Performativity places much emphasis on individual agency, when it is precisely at that level, in the face of powerful norms and the costs for alternative behavior, that people find it most difficult to act differently. Multiple and intersecting differences do create complex subjectivities, but if one carries this diversity to a logical conclusion, it serves more to paralyze than mobilize. Bradley (2004) contends that instead of looking at gender and gender and class, postmodern gender studies have delinked gender from social class and focused instead on sexuality, the body, representation, the media, identity, and nationality. Overall, postmodern ideas ignore the collective notion of the political, underestimate economic factors, and do not sufficiently consider the influence of the state, related social institutions, and diffuse structural forces. In short, postmodernism tends to take its diagnosis of gender problems as the solution itself.

Also, since the early 1990s, there has been a theoretical move toward issues of recognition; exponents of this thought include Fraser (1997, 1998) and Phillips (1999). Fraser (1998) has made major contributions to feminist theory by bringing up the distinction between redistribution and recognition, arguing that both a just share of economic resources and the recognition of distinct cultural identities must be involved in the elimination of gender differences in society. Redistribution in this case refers to material injustice, associated with economic exploitation, deprivation, and marginalization; recognition refers to cultural injustice, which in this case means women's cultural domination, denigration, and lack of recognition and respect. Implicitly, cultural injustice includes the nonrecognition or low recognition of feminine values. It also includes the failure to value properly the roles that women perform on a daily basis – those linked to caring and household management and to private sphere work in general. The notion of recognition seeks to rescue positive self-representations of one's own making (Lynch, 2001); in other words, recognition is the acknowledgment by society that women's attributes are valuable and that they have right to their own identities. Fraser (1995, 2000) cautions against an identity politics that is divorced from institutionalized status inequalities; both Fraser (1998) and Phillips (1999) underscore the need to link problems of recognition to problems of redistribution, or access to material goods and services. Kenway (2005) feels that perhaps today there is too much emphasis on aspects related to cultural injustice at the expense of material injustice. While there is much validity to the assertion that the recognition and the redistributive aspects of social justice are greatly pertinent to the understanding and modification of gender relations, this link has not been paid much attention in education although there has been some effort in several industrialized countries to address issues of difference and identity (Lynch, 2001) as well as interventions to eliminate sexual stereotypes from the curriculum. Educational policies have emphasized parity or equal participation of women and men in schooling. These policies have shown weak admission of the gendered character of society and schooling, and ignored feminist theories that deal with ideological issues such as patriarchy, material inequality, and identity-based conceptions. Implicitly, educational policies have been based on a theory of gender that relies on education as the means to foster the economic and social improvement of women regardless of underlying and pervasive historical and cultural forces. Consequently, educational policies have followed distribution (the provision of formal schooling) rather than redistribution (reallocation of resources) and recognition (reallocation of values and statuses) approaches to gender.

Countervailing Forces

As a movement that seeks major changes in the norms and beliefs that shape society, feminism has had to contend with several institutional and social responses against it. Significantly, prevailing feminist theories seldom conceptualize the emergence of groups that will fight against the introduction of changes in gender ideologies.

In the Latin American context, the Catholic Church has been decisive in preventing modifications in the curriculum in favor of introducing sex education and the treatment

of sexuality as a cultural practice with differential attributions and consequences for men and women. Its arguments have usually been that the family is under attack and that the questioning of the “natural differences between men and women” will lead to homosexuality (Bonder, 1998). Similar experiences have been documented in the Dominican Republic, Peru, Costa Rica, Chile, and Mexico. The Church’s tactic of removing certain issues from discussion resonates with the observations made decades ago by Bachrach and Baratz (1970), who introduced the idea that when the power of one set of interests or perspectives prevents fundamental questions from being introduced into the political agenda, citizens remain ignorant of such issues. In regions influenced by Islamic norms, women’s place is preponderantly in the domestic sphere.

A more diffuse but widespread force operating against gender issues has been that of globalization. By fostering the strategy of market-driven solutions and the role of individuals in moving ahead as opposed to a caring state or solidarity in the resolution of social problems, globalized competitiveness has fostered a climate that both exalts individualism and limits state participation in the consideration of social issues. Market-driven (neoliberal) policies, by reducing social services provided by the state, has shifted burdens to women (Subrahmanian, 2005; Kenway, 2005; González de la Rocha, 2006), an effect not recognized by state agencies. It could be argued that the subjugation of women, expressed in their ascribed role in the domestic space, is needed to subsidize costs for the elderly and the young through care, costs that the state, especially the neoliberal state, is not willing to pay (Odora-Hoppers, 2005). Despite these facts, many governments refuse to recognize that neoliberalism disadvantages women as the welfare state retreats. It has also been noted that many governments refuse to “grow conceptually” (Kenway, 2005, p. 50), failing to reflect on masculinity and femininity.⁶ The competition for survival or for one’s own livelihood has been sharply reflected in the slowing activism of women-led NGOs, whose levels of funding from external support have already diminished. Against the less-than-desirable funding of public schools by many governments, civil society has mobilized to demand greater state investment in education. In the case of Latin America, for instance, there is a substantial social movement in favor of public schooling of high quality. This movement has been quite visible in recent World Social Forums and yet it has little to say about *gender issues* in education. Consequently, today, civil society has been unable to exert sufficient pressure from civil society upon states to conduct themselves differently from a gender perspective.

In industrialized countries, following some limited support for a feminist agenda in education during the 1980s and 1990s, a backlash against girls’ education has emerged. This has been observed in Australia (Kenway, 2005), US (Stromquist, 2006a, Nash *et al.*, 2007), and the UK (Arnot *et al.*, 1999). Essentially, this backlash, known also as “the boys movement”, argues that there have been “gender wars in the classroom”, a result of which is that boys are suffering in terms of school access and performance. The complaint now is that all the attention to assist girls has resulted in a disregard of boys, who have been falling behind in terms of academic achievement and college completion. The arguments here move along the lines of boys and men in crisis rather than on the examination of the nature of gender cultures or the formation of pluralistic notions of masculinity; it tends them to see men as victims of feminist action

(Kenway, 2005). In the US, the backlash against girls and women has also taken the form of the “homosexual threat”, with sex education programs delivered by religious groups with federal government support to promote the notion of sexual abstinence and the labeling of masturbation as a “gateway drug” (Kendall, 2006). This backlash is also occurring in a climate that provides little attention to the differences in the labor market and political representation and their connection to gender ideologies. Several explanations for the reduced presence of men in education exist. Some observers assert, without evidence, that schools are becoming more girl- than boy-friendly. Others argue that it is easier for boys than for girls to join the labor market at lower levels of education, in such occupations as construction, mechanics, and transportation. Still others think that women tend to persist more in education because they realize they need more leverage to compete in the labor market. In any case, it seems that reindustrialization (in developed countries) and deindustrialization (in many developing countries) has affected working-class men, leaving many without work and without the traditional working-class culture that supported their masculinity (Kenway, 2005).

Conducting Institutional Change

The experience across several decades of efforts to improve school experience and content so that gender issues may be properly treated tells us change is possible but difficult. At present, the dominant school culture presses toward high performance, as manifested in individual achievement scores and, from those, in the production of school rankings. Efforts to address gender today face a hostile environment and the spaces where women can negotiate and even resist are increasingly more limited.

Various complementary strategies could be put in place, from mainstreaming gender in all educational functions, to building capacity among those in charge of implementing gender equity policies and programs, to altering educational materials and curricula to incorporate gender issues, to modifying school environments so that most of their physical spaces are conducive to supportive environments for the re-creation of gender along less polarized lines.

Gender mainstreaming is a comprehensive strategy that has been tried in very few countries (notably, South Africa⁷) and is one that demands solid commitment for it to work. Training is indispensable and it is clear that it cannot be limited to teachers. Principals, high-level education authorities, and policy-makers in general must have exposure to systematic knowledge about gender. Teacher training, crucial as it is, is seldom explicitly considered in policy documents, nor is it considered in the regulations that follow them. From a gender perspective, the absence of pre-service and in-service training is one of the major weaknesses of public policies.⁸

Gender-related knowledge should be incorporated into formal education via two main types of courses: those dealing with sex education and those dealing with social studies (including civic education). Such courses should consider themes common to all countries as well as those relevant to specific countries. For instance, students across the world should receive knowledge about sexuality, masculinity, gender, and responsible sexuality, but sexuality in serious matters such as HIV/AIDS should receive

major importance in the southern Africa region. In some countries, especially in rural areas, there are substantial problems with the sexual abuse of girls in schools, so this issue should receive clear attention. Civic education should include discussion of citizenship and how it still has many gendered features; in particular, it should foster the recognition of human differences and promote solidarity and collective action. More state-guided interventions would be needed to engage in tangible forms of affirmative action in favor of women's employment in administrative positions. Such policies should consider the complete cycle: preparation for the job, help at the entry phase, and assistance for proper performance. Most affirmative action policies at present limit themselves to entry.

Efforts to work on gender issues have been too centered on formal education and thus on young women to the detriment of adult women. Outside schools, away from the gaze of the state and the strictures of long-established bureaucracies, women's groups have been able to attain significant personal change and social modifications through self-organizing and applying pressure on the state to enact public policies in areas that involve domestic violence, health, jobs, and political representation. Women's and feminist organizations have been working on important gender issues through nonformal education and informal learning. Usually, these groups have been able to attain more changes than has formal education. As nonformal education serves adults, it incorporates women with varying degrees of experience in their private and public lives – experience that makes them receptive to transformative knowledge (Stromquist, 2006c).

Conclusions

The framing of a problem shapes its solution. At present, in different arenas and for different reasons, there is limited analysis of the gendered nature of social problems and only modest solutions designed to redress gender-based inequities. While the state in its national and international forums has been able to produce global agreements to work on gender and women's issues, these instruments have proven to be double-edged. On the positive side, the state has admitted that it should be responsible for its citizens, and that includes the provision of benefits and services to women. Global policies have brought salience to issues of gender and education and have led to the adoption of policies by governments that may otherwise have done little in that respect. On the negative side, the state has tended to co-opt the movement and its key concepts, and made its measures devoid of transformative purposes. State responses are often rhetorical and more recent global goals have even diminished previously achieved feminist agendas (as has occurred through several of the MDGs).

Discourses accomplish many tasks. They serve to present certain voices and by omission to silence others. Those most often presented become more legitimate and authoritative. Today, governments emit contradictory messages, extolling the values of individualism and competition and coupling them with declarations in favor of social inclusion and democracy building. Examined from a sociological perspective,

in which issues of content and power differentials are analyzed, it can be concluded that critical issues of the educational system are not treated. Public policies do not generally dismiss such issues as nonimportant after due consideration; rather, they tend to ignore controversial gender issues from the beginning. This occurs primarily by the failure of officials in governments and bilateral organizations to take the educational feminist literature into account. It also occurs through the co-opting of terms such as gender, gender equity, and women's empowerment without a serious effort to deal with such powerful concepts.

Further compounding the negative situation is the fact that the terrain of gender politics and education is not very active at present. Moreover, organized women rarely participate (nor claim to be included) in educational forums. It is difficult to receive a benefit from bodies in which women do not have a voice and when women's voices are too varied. It would seem, therefore, essential to encourage dialogue and alliances between the academy, civil society organizations, and sympathetic governmental units to stimulate greater attention to gender in education.

Our contemporary world is characterized by contradictions. Governments now call simultaneously for market-led development (assumed to take care of everything) and for human rights and democratization, especially in developing countries. The first, however, implies no state resources while the second makes them indispensable. While governments do express contradictory objectives at the discursive level, at the practical level, the emphasis is clearly on market-led efforts. Although public policies are being constantly enacted, the use of policy instruments such as material resources, legislation, equity plans and reports, and the establishment of gender machineries within the state lag well behind the use of symbolic politics.

The issue of gender in education has reflected considerable shifting in its ideological treatment. Among women-led NGOs, especially in developing countries, there is a concern with access to education and ensuring that gender parity is attained at all levels of education. Women's groups are concerned with the MDGs and would like to see them become a reality. Among women in academic spaces, gender is being conceptualized in forms that derive more from the humanities (philosophy and literary theories) than from the social sciences and that seek to understand gender in its full and elusive complexity rather than linked to making interventions to address the asymmetrical power consequences of gender. As postmodernism has become stronger in the academy, it has provided a bonus in the formulation of new ideas and perspectives without having solved old problems. In some ways, theory functions as a refuge from action. And, yet, as Lynch reminds us: "It is increasingly recognized that unless research on inequality develops some means of working towards an emancipatory goal for those with whom or about whom it speaks, there is a very real sense in which the research process becomes another tool of oppression." (Lynch, 2001, p. 243). Looking ahead, the real challenge for feminism lies in its ability to present a united front, both theoretical and practical, in its strategies to persuade men to join a struggle for ideological transformation, and in its ability to enter a negotiation for policy purposes that includes a recognition of the Other, one that nonetheless represents more than half of humanity.

Notes

- 1 Not surprisingly, pregnancy and motherhood are significant determinants among girls for dropping out of school.
- 2 By the end of 1999, PROGRESA covered 2.6 million families, or about 40% of all rural families and one ninth of all families in Mexico, operated in almost 50,000 communities, and represented an annual investment of \$777 million (or 0.2% of Mexico's GDP (Behrman & Skoufias, 2006). Its successor, Oportunidades, was reaching about 5 million families by 2005.
- 3 The BRAC schools, in existence since 1985, now number 40,000 and have served close to 8% of the primary school population in the country.
- 4 The Quetta program is small, reaching some 10,000 students in schools that comprise about 30% girls.
- 5 This section is a highly personal account of how theoretical issues have evolved. Several others are possible. The one I present emphasizes the trajectory within the educational sector.
- 6 Over the past decades, governments have come to recognize as problematic certain situations that had once been deemed normal and thus beyond legal action. These issues include child abuse (which was not recognized until 1965), domestic violence, sexual harassment, and marital rape.
- 7 In South Africa, success has been reported in setting up gender desks in teachers unions to achieve parity in salaries, intervening in curriculum development to employ a human rights framework (covering issues of sexual harassment), and promoting more women to management positions (Mannah, 2005).
- 8 Given low salaries and poor working conditions in many countries, teachers are generally mobilized by economic improvement rather than social transformation.

COMPARATIVE EDUCATION, POSTMODERNITY AND HISTORICAL RESEARCH: HONOURING ANCESTORS

Marianne A. Larsen

The field of comparative education has been particularly slow to get ‘past the post’ (Cowen, 1996) and actively engage with the ideas of postmodernism.¹ Over 15 years ago, Rust, who was then the President of the Comparative and International Education Society (CIES), commented on our reluctance to consider the implications that new feminist, postmodern and post-structural theories present for comparative education. Rust (1991) claimed that postmodernism should be a central concept in our field’s discourse and called upon comparativists to

define more clearly the metanarratives that have driven our field [and] engage in the critical task of disassembling these narratives because they define what comparativists find acceptable, desirable, and efficient in education. At the same time, we must increase our attention to small narratives [and] the far-ranging Others of the world. (p. 625–626)

During the 1990s, we began to notice a tentative shift as a few creative comparativists engaged with the ideas of postmodernism. Ninnes and Burnett (2003) traced the slight increase in the number of citations of post-structural scholars in the comparative education literature during this period. Comparative education conference themes also began to reflect an interest in ideas and concepts associated with postmodernity (e.g., CIES Western Regional Meeting, 1998; World Congress of Comparative Education Societies, 2000). Some comparativists used the onset of the new millennium as an opportunity both to reflect upon our traditions and actively engage with new challenges that the ‘posts’ pose to our field (Cowen, 2000; King, 2000; Koehl, 2000; Mehta & Ninnes, 2000; Paulston, 2000). Since 2000, there have also been a few publications in the field with a clear postmodern bent, the most obvious being Ninnes and Mehta’s (2004) edited book *Re-imagining Comparative Education: Postfoundational Ideas and Applications for New Times*. We have also seen an increase, albeit a small one, in publications engaging with post-colonial theory (e.g., Crossley & Tikly, 2004; Hickling-Hudson, 2006).

However, these shifts have been limited ones and comparativists who explicitly position themselves as postmodern, post-colonial or post-structural researchers continue to remain on the fringes of our field. Arguably, the relatively late onset of this

debate within comparative education and relative lack of engagement with postmodernism over the last 15 years is surprising given the related interest in interpretivist and phenomenological research, and supposed commitment to valuing diversity, pluralism and heterogeneity within our field.

Despite the marginal position of postmodern thinking within comparative education, some comparativists have sounded alarm bells over the epistemological and methodological challenges that postmodernism poses for our research and the boundaries of our field (Crossley, 2000; Epstein & Carroll, 2005; Torres, 1997; Watson, 1998; Welch, 2003). One critic noted that as a result of these and past methodological debates, our discipline has lost some of its credibility and become “rootless and directionless” (Watson, 1999, p. 240). Others have gone so far as to decry the perils and dangers of postmodern thinking, claiming that postmodern comparativists are guilty of perpetuating a hegemonic and totalising discourse that is “plausibly the most serious challenge ever to boundary stability” that our field requires (Epstein & Carroll, 2005, p. 63). These critics would concur with Crossley’s earlier contention that our field has responded too directly to changing disciplinary fashions, with the result that the stages of its own development indicate a rejection of past practices, rather than a “cumulative advancement” (Crossley, 2000, p. 327).

I disagree with these claims. Contrary to what some of these critics claim, postmodern thought within comparative education is not (yet) a “force to be reckoned with”; nor have we been witnessing extraordinary growth (Epstein & Carroll, 2005, p. 64) in postmodern or post-structural thinking within our field. Further, I agree with Rust and others who believe there is room for a wide range of approaches within our field. Specifically, as a historian, I am particularly interested in how we can reinvent or rethink the role of historical research within our field to include the ideas of postmodernism, post-colonialism and post-structuralism.

What I intend to do in this chapter is explore three key ideas. In the first section, I challenge the claim that historical research has been waning in our field since the early days of historical comparative education studies. I then turn my attention to the value of historical research within the field and finally to the specific value of a postmodern form of historical research for comparative education, drawing upon some of the ideas and concepts of the French social philosopher Michel Foucault. Finally, I believe that the work of Foucault provides us with ways to engage with postmodernism, shorn of some of the excesses its critics so readily point out. In this respect, we can engage with existing possibilities to rethink historical comparative education research, through a critical, reflective, multi-interpretive postmodern lens.

A Discontinuous History of Historical Research in Comparative Education

Contemporary comparativists have noted their concern about the paucity of historical research within the field since the 1950s (Kazamias, 2001; Sweeting, 2005). Indeed, this would appear at first glance to be the case. A study of research strategies in comparative education from 1955 to 1994 revealed that there were only a small number of journal articles which relied on historiography and historical research. Studies based

on literature reviews, history and comparative methodology dominated in the field in the 1960s, but historical studies and literature reviews decreased significantly in the 1980s and 1990s (Rust *et al.*, 1999).

The authors of this study conclude that very few comparative education researchers note where their work is located within the methodological debates that characterised the field in the 1960s and 1970s. They suggest that contemporary authors may be unaware of those debates because they have little historical sense of the field to which they belong or contribute (Rust *et al.*, 1999). This shift has caused one commentator to note that our field now suffers from “historical amnesia” (Watson, 1999, p. 235). These concerns speak to the necessity of having histories of our field written and available for both new and more well-established comparative education scholars.

Some existing histories provide an overview of comparative education research and emphasise the centrality of historical perspectives and methods in the field’s early days (Altbach & Kelly, 1986; Crossley & Broadfoot, 1992; Epstein, 1994; Sweeting, 1999). These accounts are primarily written as chronological histories of the development of the field along an evolutionary path. However, as I argue later in this chapter, there is much to be said for a history that emphasises beginnings, not origins; small stories, not meta-narratives; and discontinuity over evolutionary principles. Within our own history, there has been considerable chaos, discontinuity and non-linearity, which this following short account of the role of historians and historical research within comparative education will attempt to illustrate.

Where one starts one’s history is an act of interpretation. In effect, as historians we are always constructing the past through the narrative strategies that we adopt, usually intuitively, to communicate our findings. Like other comparative historians of education, I choose to start with Sadler, whose words at the turn of the last century clearly demonstrated the need for comparativists to take into account factors beyond the school in order to understand education:

In studying foreign systems of Education we should not forget that the things outside the schools matter even more than the things inside the schools, and govern and interpret the things inside. ... A national system of Education is a living thing, the outcome of forgotten struggles and difficulties, and “of battles long ago”. (Sadler, 1979, pp. 49–50)

After Sadler’s 1900 speech emphasising the need to take historical contexts into consideration, there is a long 30-year break until the emergence of works by comparative educationists who were either historians or who explicitly integrated a historical perspective into their research. Individuals such as Kandel, Hans, Mallison, Schneider and Ulich approached comparative education from a contextual framework, which included among other factors the role that history played in the development of educational systems. However, it is important to point out the differences in how each of these comparativists approached the study of history. Schneider, for example, rejected the national case studies favoured by Kandel and Hans, emphasising instead the notion of historical immanence, a kind of ideational and institutional cumulative tendency possessed by societies (Schneider, 1961).

Kandel, Hans and Ulich can be located within the ‘forces and factors’ tradition of comparative education. They wrote not only about past events, but identified antecedent factors and forces that influenced educational forms, policies, and practices, and ‘determined’ the evolutionary development of educational systems. The historian Hans concluded that historical background (complemented by other approaches) is indispensable to any interpretation of comparative data (Hans, 1959).

Despite claims to the contrary, historical comparative research did not wane during the 1960s search for a scientific comparative education. Like Hans, Bereday used history as an analytic tool to understand contemporary events. On the other hand, rather than seeking to uncover historical causes from which explanation and prediction could be derived, Holmes used history pragmatically through his problem-solving method. In stark contrast to Holmes’ positivist position, King’s work during that same period seemed decidedly postmodern for its time. In 1958, he wrote:

In much present day examination of technological, social and educational development we often suppose that a continuous growth or historical ‘evolution’ has taken place. We also tend to suppose that different levels or stages correspond fairly closely to chronological periods. We often forget that at any one given time of considerable change several distinct educational idioms or assumptions may co-exist for a considerable time. These are not always compatible with one another. They may be in direct conflict. (King, 1958, p. 169)

Although King contended that most comparative histories assumed continuous growth and progress in educational development, C. Arnold Anderson noted only 2 years later, in 1961, that extreme historicism was on the wane, as comparativists were beginning to reject the unilinear evolutionary orientation which had characterised our early days. Yet, in that very same year, Ulich’s broad, evolutionary historical analysis *The Education of Nations: A Comparison in Historical Perspective* appeared. The contradictions within our history of historical comparative research are evident here: ambiguities and inconsistencies in how comparative educationists approached the study of the past.

Other historical accounts were published in the 1960s and 1970s, reflecting again the diversity of historical approaches within the field. We witnessed the publication of Anderson and Bowman’s (1965) *Education and Economic Development*, and Kazamias’ (1966) *Education and the Quest for Modernity in Turkey*. Numerous other broad-based meta-narratives of historical research appeared soon after by authors such as Archer, Foster and Zohlberg, Husén, King, Paulston, Ringer and Whitehead, attesting to the continuing interest in history within comparative education research, even during the ‘science of comparative education’ days.

Another break occurred in the 1970s with the emergence of dependency, world systems and neo-Marxist theorising, which led to further historical studies, positioned apart from previous accounts in the field. During this period, comparative historical work shifted to include research on colonialism and cultural imperialism. Shifting forward 30 years we see both connections to these studies and marked differences in theoretical perspectives with the emergence of recent post-colonial research, which has also been framed within historical contexts.

Although there was a decrease in comparative education journal articles from historical perspectives throughout the 1970s, we would do ourselves a disservice to ignore the many thorough histories of education written by comparativists and comparative accounts of education written by historians from the 1970s through to today. Further, it is important to point out the historical studies by comparative educationists published in history journals and overlaps between those who worked within the field of comparative education and those within the discipline of history (Schuster, 2003). Indeed, one of my own comparative historical studies of education was published in a history journal (Larsen, 2002) and Cowen (2002) chose the journal *History of Education* to expand upon his ideas about time as a key ‘unit idea’ of comparative education.

Although there have been a number of recent calls for the reintegration and reinvention of historical studies within comparative education research (Kazamias, 2001; Sweeting, 2005), I would argue that there was never an end to history within our field. I have presented a brief overview of some historical comparative education studies over the last 75 years. Most of these reflected the dominant paradigm of historical research focusing on evolutionary principles, grand narratives and seeking to uncover the truth about the past. However, they approached their topics with varying perspectives and our own historiography of comparative historical research has been characterised by its discontinuities, differences and uneven development.

Rationale for Historical Research in Comparative Education

There are numerous reasons to continue our rich tradition of historical research within comparative education. Addressing the historical contexts in educational policy research can lead to more sensitively refined recommendations for the improvement of educational systems. Historical analyses can also better enable us to understand the educational systems under study. Lastly, and I would argue most significantly, historical research allows us to move towards developing a better understanding of ourselves and the world.

The use of the historical method within comparative education by individuals such as Kandel, Schneider, Hans and Ulich was meant to increase understanding of the development and present status of educational systems. Hans (1959) contended that the differences of denominational attitudes, national aspirations or what he called ‘national character’ are located deep in the past and sometimes subconsciously determine our present. Only through historical investigation can we “bring them to the surface, illuminate their potency in the cultural lives of nations and make comparative education really educative” (p. 307).

Hans was following Kandel’s lead in adopting a historical-functional approach to the study of comparative education. Kandel argued that comparativists must examine the “causes” that explain differences between national systems of education. In the introduction to his 1933 book, he wrote:

In order to understand, appreciate and evaluate the real meaning of the educational system of a nation, it is essential to know something of its history and

traditions, of the forces and attitudes governing its social organization, of the political and economic conditions that determine its development. (p. xix)

Although Kandel's 'forces and factors' approach was intended to facilitate greater understanding of educational systems, his approach was also melioristic (Kazamias, 1971). Such has been the case with most of the comparative-historical research even up until today. In this light, comparative educationists have been called upon by international agencies and different levels of governments to suggest improvements for educational systems. Most of this research, however, is void of historical context.

While most policy research faces financial and time constraints, resulting in little in-depth, historical analysis, an argument can be made that we need historical approaches in order to develop policies that are sensitive to local cultural, social, and economic concerns. In this light, Watson argues that "comparative historical experience of what has been tried elsewhere and with what success and failure ... is rarely called upon in policy recommendations, often with depressing consequences. ... There is a real challenge for comparative education to re-establish its unique role in providing comparative historical insights for future policy action" (Watson, 1999, p. 235).

While there might be value in reintegrating historical methods into comparative education research for problem-solving, policy purposes, others have noted the problems with this direction. We need to be cautious about blending the descriptive, 'what is' approach with a 'what ought to be' approach. The comparative education historian Kazamias (1971) suggests that before one embarks upon the 'ought', one should, as objectively and as dispassionately as possible, investigate what the problem is. Thus, the historian's task should not be to prescribe, but rather to describe and illuminate certain phenomena.

While comparative education has been used as a tool of explanation, prediction and scientific enquiry, I agree that our field should be more interpretive. We can, and I would argue, ought to use history to illuminate particular events, contextualise analyses, and most importantly to understand and problematise not only educational practices and systems, but the world itself. Indeed, if comparative education is to move away from prescriptive policy proposals to genuine understanding or *Verstehen*, then we need to reconsider Sadler's idiographic approach (Epstein, 1994). We need to shift beyond the idea that the task of comparative research is to understand educational systems to thinking about how our work allows us to "read the world" (Cowen, 2000, p. 334). In this respect, there is much to learn from historical research. As Bloch (1964) wrote in *The Historian's Craft*, history is animated not by the love of the past, which is antiquarianism, but by a passion for the present. It is this "faculty of understanding the living [that] is, in very truth, the master quality of the historian" (p. 43). The question is how can this be done while taking into account the criticisms, which are outlined next, that postmodernism has launched against traditional historical research.

Postmodern Critiques of History

Postmodernism is very much a contested terrain between those who would define and occupy it, and those who would discredit or demolish it. The discipline of history has been

actively engaging with these debates for many decades now. As early as the 1930s the discipline of history faced challenges to its commitment to objectivity from progressive US historians Beard and Becker who argued that since each individual had his/her own version of history, history functioned as a cultural myth rather than as an objective account of the past. They claimed that the ideal of a definitive, objective reconstruction of the past was chimerical. Facts did not present themselves directly to the historian. Rather, the historian picked and chose among them, guided by his ideological presuppositions, making it impossible for historians to escape the dominance of practical problems of the present in determining their interests, values and presuppositions. This relationship to the present made historians unable to achieve an objective approach to the past or to ever know it as it actually was (Beard, 1983; Becker, 1983).

The debate over the scientific status of the study of history continued among philosophers throughout the United States and Britain throughout the 1940s and 1950s. The discussion re-emerged in 1988 with the publication of Peter Novick's *That Noble Dream: The "Objectivity Question" and the American Historical Profession*, in which he concluded that objectivity is not only a delusion but also an essentially confused concept (Novick, 1988).

Into the twenty-first century, history's attempt to follow Herodotus' goal, "to record the truth about the past" continues to be challenged by the discourses of postmodernism, post-structuralism, and post-colonialism. Historians have responded in different ways to postmodern incursions into their field. Some have considered postmodern challenges as threatening the very existence of history as an intellectual discipline and consider themselves defenders of history against the relativist onslaught of postmodernism (e.g., Himmelfarb, 1997; Roberts, 1998). Others, while considering postmodern contributions to the field of history, maintain a commitment to history's objective search for truth (e.g. Appleby, Hunt & Jacob, 1995; Evans, 1997). Lastly, there have been a few historians and historiographers who have, to varying degrees, embraced postmodernism as providing exciting new opportunities for their discipline (e.g., Ankersmit & Kellner, 1995; Berkhofer, 1997; Poster, 1997).

Some postmodernists have identified the end of history with the end of meta-narratives and traditional ways of knowing. Foucault, Baudrillard, Lyotard, Derrida, Deleuze, Barthes, Bourdieu and to some degree even Lacan and Althusser all demonstrate in their work a sense that modernity is coming to an end and that something new is emerging (Poster, 1997). In this respect, unlike modernists such as Fukayama, who also proclaim the end of history, they are expressing a postmodern or post-structuralist 'end of history' argument. In the contemporary field of historiography, Jenkins (1997) epitomises this approach. In his introduction to the *Postmodern History Reader*, he writes:

[T]he whole modernist History/history ensemble now appears as a self-referential, problematical expression of interests, an ideological – interpretative discourse without any non-historicized access to the past as such. In fact history now appears to be just one more foundationless, positioned expression in a world of foundationless, positioned expressions. (1997, p. 6)

Jenkin's argument is not so much an end of history as such, but an end of grand narrative history and the more familiar history produced by academic historians.

Others who have not gone so far as to proclaim the end of history, view the discipline as fundamentally flawed. Some have critiqued traditional or 'normal' history's attempt to provide some kind of true representation and understanding of the past (Berkhofer, 1997). Indeed, in the place of traditional history, postmodernism posits that the past cannot be the object of historical knowledge, or more specifically that the past is not and can never be the referent of historical statements and representations.

Like traditional historians, new social historians, including the *Annales* school, assume the historian as a stable knower of an objective world, whereby truth is viewed as the unmediated relation of the historian to the past. Poster's (1997) critique of the work of both 'old' political-intellectual history and 'new' social history demonstrates how both still seek to attain the truth about the real. Poster, like other postmodern historians, draws largely upon the ideas of the French historian Foucault who provided a comprehensive critique of the discipline of history.

What Can We Learn From Foucault?

Foucault critiques the discipline of traditional or what he interchangeably calls 'total' or 'continuous' history for focusing on overarching principles which govern the development of an epoch; its concern with notions such as evolution, development, spirit of the age or the mentality of a civilisational tradition; the emphasis upon historical continuity, series, periodisation; and the conception of time in terms of totalisation. The project of total history, according to Foucault, is:

one that seeks to reconstitute the overall form of a civilization, the principle – the material or spiritual – of a society, the significance common to all the phenomena of a period, the law that accounts for their cohesion – what is called metaphorically the 'face' of a period. (1972a, p. 8)

Furthermore, the teleological focus of total history means that it attempts to provide a direct link between origins and the present in order to legitimise the present as a continuation of the past.

The historical approach known as archaeology was developed by Foucault in a number of his earlier writings as an alternative to total history (Foucault, 1972a, b, 1986). The concept of discourse, defined by Foucault (1972b) as systems of statements whose organisation is regular and systematic, consisting of all that can be said and thought about a particular topic, as well as who has permission to speak and with what authority, is central to archaeology. Archaeology involves describing recurrent statements, understood as units or parts of knowledge, found in the archive related to a topic or theme.

The process of examining texts for recurrent statements on a particular topic or theme is one aspect of the archaeological method. Archaeological investigation then involves determining whether or not a statement has fulfilled a set of conditions that allow it to be considered an instance of a particular discourse. These conditions consist of the rules, relations, and patterns that connect, relate, and divide what can be said

and repeated about a topic (e.g., in *The Order of Things*, Foucault (1986) attempts to analyse the rules of formation that regulated the emergence of the human sciences). Description can therefore allow the historian as archaeologist to establish an open, theoretical model to understand the rules, relations, and procedures between and amongst statements. This highlighting of the way that knowledge is organised or systematised makes discourse an analytic tool.

In analysing a group of statements unified by a common theme, archaeological research does not attempt to smooth over the apparent differences, aberrations, and inconsistencies between statements. Foucault cautions that the archaeologist should not force unity and coherence on a group of statements. Rather, archaeology involves the process of studying forms of division and dispersion. Foucault (1972a) explains how this process is not an attempt to locate the hidden meaning of contradictions within documents:

In archaeological analysis, contradictions are neither appearances to be overcome, nor secret principles to be uncovered. They are objects to be described for themselves, without any attempt being made to discover from what point of view they can be dissipated, or at what level they can be radicalized and effects become causes. (p. 151)

From this it is possible to see that archaeology involves the dual process of attempting to locate unity and cohesion, while simultaneously destabilising that same unity. Discontinuities, divisions and breaks are highlighted, opening up spaces for a more careful analysis of how a series of statements becomes a recognisable object of discourse. Discontinuity, as I have tried to demonstrate in the above account of historical research in comparative education, becomes a problem to be investigated. Foucault (2000) explains:

History becomes “effective” to the degree that it introduces discontinuity into our very being – as it divides our emotions, dramatizes our instincts, multiplies our body and sets it against itself. Effective history ... will uproot its traditional foundations and relentlessly disrupt its pretended continuity. (p. 380)

As events, discontinuities are the moments when the normal course of things is interrupted. Unlike the traditional or social historian who aims to place and order events in a linear, continuous pattern in order to understand historical laws or phenomena, archaeological research leaves these breaks exposed.

Archaeology points to the specificity of each moment or period in time. Each historical period is viewed as different from our own, but not necessarily better or worse than the present. Foucault demonstrated this in his book *Madness and Civilization*, reversing the traditional narrative of madness and its treatment and showing how the contemporary situation is neither better nor worse than the past. In his examination of the ways in which the treatment of the mad has changed, he looked not for some original essential meaning of madness, but how the idea of madness was reinvented over specific times and places in history for different purposes.

Each moment in time is considered within its own specificity, and described without attempting to connect it in a linear, developmental pattern to that which went before and that which followed. This process, according to Foucault (2000), entails cultivating “the details and accidents that accompany every beginning” so that the historian can “recognize the events of history, its jolts, its surprises, its unsteady victories, and unpalatable defeats” (p. 369–92).

In emphasising the specificity of each moment in time and place, historical events are described as contingent, meaning that the emergence of any particular event was not necessary, but only one possible result of a whole series of complex relations between other events. Thinking causally privileges determinism where the existence of certain factors, in and of themselves, leads directly to or determines certain outcomes. With this type of thinking comes the correlative focus on predictability and inevitability. For if it can be determined that certain events inevitably cause or determine other events to unfold, then the historian, as social scientist, can predict the likelihood or probability of a similar event occurring if the correct conditions are met. In many respects, this form of thinking has characterised much comparative education research, especially within its international and policy-oriented manifestations.

An examination of conditions rather than causes eliminates the inevitable nature of how events unfold over time and place. Understanding how a certain discourse arose out of series of conditions means that there is nothing necessarily inevitable about the unfolding of historical events. This type of historical research is less certain and predictable, and acknowledges the possibility of a range of different ideas and practices emerging at any one time and place. In thinking about history in terms of conditions of possibility, the concern is not to explain why individuals start to think, speak, and write about educational topics or themes in new ways. Rather, the focus of attention shifts to *how* it became possible for new ideas and practices to emerge and new truths to be invented.

Here we can speak about the productive power of discourse to construct truths about, for example, educational practices, systems and actors. This conception of discourse moves away from a linguistic approach that concentrates solely on language as constitutive of truth towards an analysis of the relationship between disciplinary practices (technologies) and disciplines (bodies of knowledge). Discourse as a practice creates objects, and by creating them, determines their nature. In other words, objects determine our behaviour, but our practice determines its own objects in the first place. Given that there are no things, only social practices, we need to understand the sense in which language, or discourse speaks through us.

The notion of practice is not mysterious or vague. Foucault, according to the historian Paul Veyne (1997), attempts to see people’s practices as they really are: things that people do. The difference is that he speaks about practice “precisely” and does not say:

I have discovered a sort of historical unconscious, a preconceptual agency, that I call practice or discourse, and that provides the real explanation for history. Ah yes! but how am I going to manage to explain this agency itself and its trans-

formations?” No: he is talking about the *same thing we talk about*, for example, the practical conduct of a government; only he shows it as it really is, by stripping away the veils. (p. 156)

Ideas are only correlatives of corresponding practices, and it is this shift to the notion of practice and the effects of discourse, which is so powerful in Foucault's histories.

Finally, Foucault's archaeological history is a 'history of the present' not because understanding an ideal present is what stimulates investigation, but because history can be used as a means for diagnosing the present. Understanding of the present as historical can be best achieved through a process of making the past strange. Perhaps the best rationale for undertaking historical research then is that it allows us to disturb and shake up that which we recognise as given. Foucault (1980) has stated that when we use history, we must not allow this history to end, to rest comfortably in its strangeness, but rather we should attempt "to use it, to deform it, to make it groan and protest" (p. 54).

Foucault challenges our preconceptions about history and historical research, presenting histories that often confront our taken-for-granted assumptions about the past. The present appears that much more unsettling, as Foucault attempts not to demonstrate the similarities between the past and the present, but the differences between the two. In his work, he seeks to isolate past moments of difference or strangeness to destabilise our present moment and "undercut the sense of naturalness and legitimacy that surrounds present-day customs" (Poster, 1997, p. 28).

It may seem difficult to grasp Foucault's concepts such as discourse, archaeology and genealogy because they are so unfamiliar and removed from the normal procedures of the discipline of history. Yet, as Poster (1997) explains,

when the veils of unfamiliarity are stripped away, however briefly, one can see that his project does make sense and does offer a new notion of what intellectual history could be about. The texts of the past can be viewed without resort to the subject and can reveal a level of intelligibility all their own. The problem of reading Foucault is not that his writing is abstract, or that his style is elusive ... It is rather that he speaks from a place that is new and strange and perhaps threatening (p. 143)

Conclusion

Like the discipline of history, the field of comparative education requires new cognitive maps, methodologies and strategies to get us through the next century. Paulston (2000) has claimed that we ought to become social cartographers, to enable us to reflexively step out of or into different reality constructs or ways of seeing. Those comparativists, he writes, "who learn to negotiate ... the new spaces of knowledge ... will have unprecedented opportunities to imagine and help to shape an interactive postmodern comparative and international education beyond our understanding today" (p. 363).

We have much to learn from the variety of historical approaches that former and contemporary comparativists have deployed in their research. We also have much to learn from historians who have actively engaged with the challenges that the 'posts' pose to their discipline. And in particular, I would argue that Foucault provides a provocative and powerful postmodern approach to historical studies that would enhance comparative education research. Indeed, Foucault's historical, methodological, and epistemological writings are so compelling because they provide a theoretical bridge between ideas and practices, and new ways of understanding the past and our present.

Within the wider discussions about the future of comparative education, I contend that there are multiple methodological and epistemological choices for all comparative researchers. At the 2000 CIES conference, sitting side by side on the same panel, Rolland Paulston encouraged us to use our imaginations to envision new spacial, visual and discursive forms of truth, while Andreas Kazamias proclaimed that we needed to reinvent the historical in comparative education to better understand the world. While one may initially conclude that these two approaches are divergent, this is not entirely the case. We have much to gain from challenging the barriers that limit wider debate and dialogue. Comparative education could benefit from imaginatively adopting the pluralistic stance, multi-interpretive strategies and general incredulity towards totalising meta-narratives that postmodernism brings to the social scientific tradition.

As noted earlier, there are some who express reservations about the shifts that have been made within our field towards postmodernism. They argue that in embracing new, popular trends we threaten the stability of our field's boundaries and reject our best past practices. However, our field's boundaries have never been stable and fixed and there is no reason why postmodernism should force us to abandon our best practices, including historical comparative work. We can continue historical research, but need not return to the modernist-inspired educational histories of our past. Why not risk undertaking historical comparative education research within a postmodern framework? As Cowen (1999) has noted, "rather than an acceptable invitation to escape from it into the ludic or nihilistic, the interstitial or the despairing ... the literature on postmodernism and postmodernity reminds us forcibly of the possibilities of tragedy and chaos and invites us to step away from our earlier confidence about the possibilities of knowing, with certainty." (p. 80)

Foucault's historical and methodological work provides a cutting edge and crucial means by which we can engage in historical research. For example, by adopting the strategies of archaeological research, we can better understand the discursive effects of classroom, school and community practices on students, their parents and teachers. Within a postmodern framework, there is also much more to learn from post-colonial theorising to problematise the legacies of colonialism. Moreover, identifying the ways that statements produce subject identities can assist in historical research on the construction of gender, race and the 'Other' within educational contexts.

Foucault can help us rethink how we have seen the past and its relations to our present, rather than providing us with prescriptive answers about what to do in the future. Foucault's work, according to Rorty, can be read as "exhibiting the unexpected and painful consequences of our ancestors' attempts to do the right thing, rather than

as explaining the inadequacy of our ancestors' concepts to the great big object they and we are trying to grasp." (1995, p. 225)

In writing about ancestors, Epstein and Carroll (2005) assert that the postmodern incursions into our field are an "abuse" to the historical ancestors of comparative education, and that certain postmodern thinkers are nothing more than "abusing our ancestors". I could not disagree more with their conclusions. Proposing that we engage with postmodern ideas and concepts is no more an abuse to our ancestors than is the suggestion that we engage with ethnographic research or any other research methods that were foreign to early comparativists. Furthermore, it is an overstatement to accuse postmodernists such as Foucault of abusing us. Indeed, by allowing ourselves as comparative education researchers to consider the potentials of postmodernism in our historical research we honour our ancestors who drew upon a multiplicity of approaches in their research and we honour those postmodern ancestors who dared to do history differently.

Note

1. Postmodernism is a slippery concept, making it difficult, if not impossible, to define. Briefly, I am concerned here primarily with postmodernism as representing the idea that Western society has undergone a major shift, which has been characterised by a repudiation of the Enlightenment project of progress, evolution and commitment to reason. Postmodernism seeks to replace the grand narratives of modernity with a multiplicity of discourses, a questioning of the legitimacy of knowledge and power, along with a critique of the idea of truth. Lyotard's (1984) statement that postmodernism is an expression of "incredulity towards meta-narratives" (p. xxiv) best exemplifies this stance. I use the term postmodernism throughout the chapter as an umbrella under which fall the related concepts: post-colonialism and post-structuralism.

ASPECTS OF EDUCATIONAL TRANSFER

David Phillips

There has always been much agonising and disagreement about the definition, purpose, and methods of comparative education. But there might be general agreement on one thing, namely, that among the aims of comparative inquiry in education should be the intention to learn from the foreign experience, to identify aspects of educational provision ‘elsewhere’ that might serve as lessons for the ‘home’ situation, that might be ‘borrowed’ or ‘copied’, ‘emulated’, ‘imported’, ‘appropriated’ – the vocabulary is both diverse and in various ways problematic – that might result, in Michael Sadler’s words, ‘in our being better fitted to understand our own [system]’ (Sadler, 1900, in Higginson, 1979).

The idea that policy and practice might be ‘borrowed’ or ‘transferred’ from other locations has, then, been a continuing theme – both enthusiastically embraced and dismissed as a simplistic notion – since the early days of comparative inquiry in education.

In this chapter I shall be concerned with ways in which notions of policy transfer have developed and in turn been analysed over the past 200 years or so. I shall refer to ‘policy borrowing’ as meaning the ‘conscious adoption in one context of policy observed in another’ (Phillips & Ochs, 2004a, p. 774). ‘Borrowing’ is therefore seen as a deliberate, purposive phenomenon in educational policy development. Borrowing in this sense is a part of ‘educational transfer’, which can be seen to cover a range of possibilities for the movement of ideas and practices (see Figure 2).

First, I shall consider the place of borrowing in the work of some key figures in the development of comparative education since the beginning of the nineteenth century. Then I shall describe some examples of borrowing over a long historical period and in various contexts. Next, I shall sketch some of the most important recent research into this general field of inquiry in comparative education. Finally I shall look at some present and future developments.

Borrowing

Marc-Antoine Jullien in his *Plan for Comparative Education* of 1816/17 had the implicit aim of identifying practices that might be transferable from one system to others:

One could judge with ease those [European nations] which are advancing; those which are falling back, those which remain stationary; what are, in each country, the deficient and ailing sections; what are the causes of internal defects which one would have noticed; or what are the obstacles to the ascendancy of religion, ethics, and social advancement, and how these obstacles can be overcome; finally, which parts offer improvements capable of being transposed from one country to another, with modifications and changes which circumstances and localities would determine suitable. (Fraser, 1964, p. 37)

This curiously modern ambition reminds us, incidentally, of the information collected in the OECD's *Education at a Glance* surveys and of the use that might be made of the PISA data.

If we jump ahead a few decades we can see much in the work of Matthew Arnold as Inspector of Schools that would lend itself to notions of borrowing. In his various writings it is clear that he found a lot to commend in what he observed in educational provision in Prussia and in France especially. But he was sanguine about the use that might be made of his findings:

'I hope with time to convince people,' he wrote in a letter of April 1868, 'that I do not care the least for importing this or that foreign machinery, whether it be French or German, but only for getting certain English deficiencies supplied'. (Murray, 1997, p. 240)

Arnold's scepticism about educational 'import' is mirrored in a comment by the Oxford academic and one-time Rector of Lincoln College Mark Pattison, who wrote a report on education in Germany for a government commission in 1861 (Arnold had reported on France at the same time):

The utility of ... study of a foreign system does not depend on the question: Are the German primary schools or training colleges better than our own? ... But the same difficulties in the way of national education with which we have to contend have to be met in the several countries of Germany, only under conditions so altered and infinitely varied as to afford a most instructive lesson. ... In this country we are little likely to err on the side of a hasty imitation of foreign modes, or to adopt a usage from a neighbouring country, forgetful that its being successful there is no guarantee that it will adapt itself to our climate. ... Much rather is everyone, who has any information on foreign systems to give, called upon to come forward with it, not as precedent to be followed, but as material for deliberation. (Pattison, 1861, vol.4, p. 68)

And no brief survey of the early comparativists and their views on borrowing would be complete without a reminder of Michael Sadler's much-quoted speech of 1900:

In studying foreign systems of Education we should not forget that the things outside the schools matter even more than the things inside the schools, and

govern and interpret the things inside. We cannot wander at pleasure among the educational systems of the world, like a child strolling through a garden, and pick off a flower from one bush and some leaves from another, and then expect that if we stick what we have gathered into the soil at home, we shall have a living plant. A national system of Education is a living thing, the outcome of forgotten struggles and difficulties, and “of battles long ago”. It has in it some of the secret workings of national life. It reflects, while it seeks to remedy, the failings of the national character. By instinct, it often lays special emphasis on those parts of training which the national character particularly needs. Not less by instinct it often shrinks from laying stress on points concerning which bitter dissensions have arisen in former periods of national history. (Sadler, 1900, in Higginson, 1979, p. 49)

So, between Jullien and Sadler, the aims had shifted from reasoned faith in the notion of educational transfer to balanced scepticism about the possibilities (emphasising in particular problems of context) and an explicit desire to use the foreign example as a means by which a ‘home’ system might be better understood. The understanding thus engendered would then lead to reform which would take into account the home context. The foreign example could be used as an *argument* in the policy discussion, as Zymek demonstrated in a seminal study of 1975, a theme later developed by Gonon in 1998.

Transfer was a topic frequently addressed by some of the leading middle-to-late twentieth-century comparativists, among them Brian Holmes and Edmund King.

Holmes (1965), outlining his ‘problem approach’, talks of ‘cultural borrowing’ and of the force of comparative inquiry as an instrument in educational reform. In attempting ‘the anticipation or prediction of the outcomes of policies’ the comparativist will want to identify “the universal, vaguely perceived problem, to intellectualise (or analyse) it in general terms, and then to reveal its specific features in selected contexts” (1965, pp. 34–35). The revelation of such features would not result in their being directly borrowed but rather would facilitate prediction on the basis of potential reform which would draw on an analysis of them. In a later study Holmes asks if ‘selective cultural borrowing is theoretically justified and practically feasible’ (1981, p. 33). He sees value in ‘ideal-typical models in the light of which a clash of cultures can be analysed’ and argues for “appropriate normative patterns, which will permit us to weigh all the fruits and educative values of innovation and which will enable us to predict in known circumstances the outcomes of policy” (1981, pp. 33–34). Implicit in Holmes’s approach is a rejection of the methods associated with attempts at cultural borrowing unless the processes involved assist in the identification of general principles on which prediction might be based.

Edmund King disagreed with Holmes on the subject of prediction, preferring instead to think in terms of hypotheses. The very way that King would formulate problems indicates a fundamentally different approach. In writing of borrowing he talks in terms of ‘living examples ... elsewhere, which might be in comparable circumstances. Or they might give some indication of why expected results did not follow apparently comparable practices’ (King, 1968, p. 87). The foreign example thus helps to explain,

to inform and to provide a basis for speculation rather than forms of scientifically arrived-at prediction.

Historical Perspectives

As I have indicated, it would be wrong to regard ‘borrowing’ as a naïve phase through which comparative studies have passed, belonging only in stages 1 and 2 of Noah and Eckstein’s five-stage sequence for the development of the subject.

The first stage for Noah and Eckstein, we may recall, represents the time when travellers brought back ‘tales’ of what they had observed. Such reports formed ‘the most primitive... observations’, originating in curiosity and emphasising the exotic so as to produce stark contrast with the norm at home: ‘Only the rare observer could extract systematic conclusions with explanatory value from a mass of indiscriminately reported impressions’ (Noah & Eckstein, 1969, p. 5). British and other travellers who come into Noah and Eckstein’s first stage were visiting Prussia, for example, out of cultural and general intellectual curiosity, and they constituted a large group of commentators whose work was very variable in quality.

The second stage covers travellers who had an educational focus to their investigations. These visitors came in order to learn from a foreign example and thereby to help improve the circumstances ‘at home’. But their reports were ‘rarely explanatory’; they tended to concentrate on “encyclopedic descriptions of foreign school systems, perhaps enlivened here and there with anecdotes” (Noah & Eckstein, 1969, p. 5).

But another way of looking at phases or stages in the development of comparative inquiry is to describe, as Michele Schweisfurth and I have attempted, a ‘sequential chain of emphases beginning at certain broadly defined historical points and continuing alongside the already existing emphases, while modifying them in various ways’. This is depicted in Figure 1.

This ‘chain of development’ (Phillips & Schweisfurth, 2006, p. 28) starts with a period limited for the most part to description, as seen in the ‘travellers’ tales’ to be found in many early accounts of political and social conditions in other countries. Next, it envisages an overlapping time when observers had a clear political purpose in mind in their investigations, a desire to influence the policy debate in their home countries and to suggest aspects of provision elsewhere that might be borrowed. An example of this approach would be the work of William Howitt (1792–1879) on Germany, designed to dissuade his British readers from espousing the notion of state control of education: “The free spirit of England and private interests will never permit government here, as in Germany, to take charge of, regulate, and enforce the education of *every* class of the community” (Howitt, 1844, p. 310). The third major development came with advances in the collection of statistical data allowing a more sophisticated analysis of socio-economic conditions and their relationship to educational provision. German governments were especially adept at the collection of statistics, and by the time of the setting-up of Michael Sadler’s Office of Special Inquiries and Reports in London (1895), it was possible to produce authoritative accounts of education in other countries based on something approaching ‘scientific’ evidence. At the same

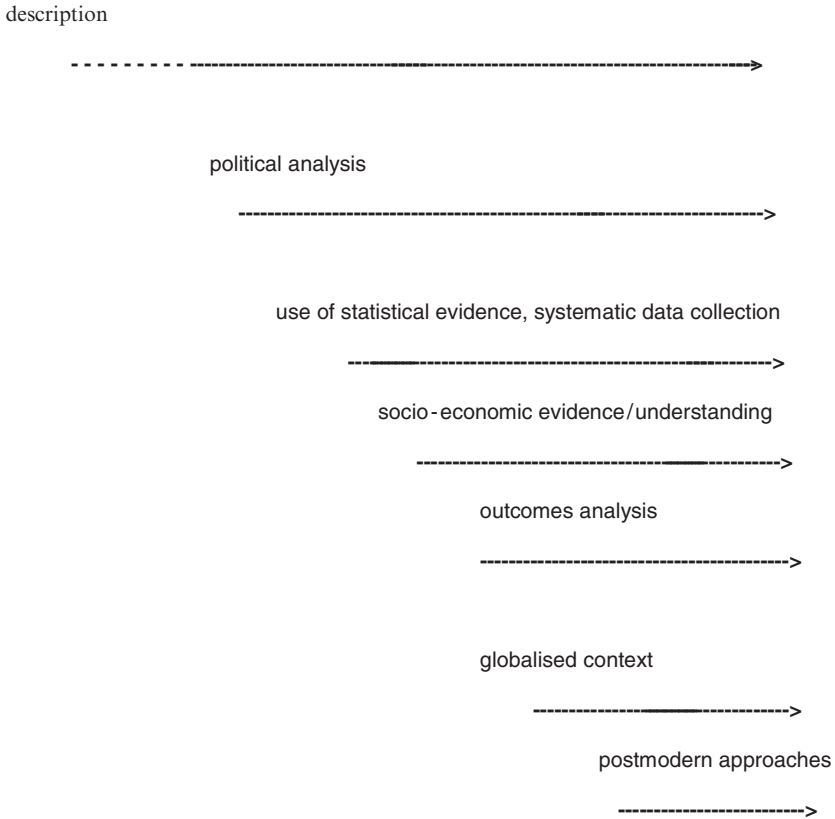

Fig. 1. Historical emphases in comparative analysis
Source: Phillips & Schweisfurth (2006, p. 28)

time, as Figure 1 describes, reporting within other traditions continued. Nearer to our own time we have seen growth in large-scale international surveys of pupil achievement and of the performance of national systems of education, as undertaken by the International Association for the Evaluation of Educational Achievement (IEA) and the Organisation for Economic Co-operation and Development (OECD), as well as the continuing work of theorists who monitor globalising trends and explore postmodern themes in education (Phillips & Schweisfurth, 2006, pp. 28–29). Policy borrowing would be a feature of each of these overlapping periods of emphasis.

Almut Sprigade has shown that in the early decades of the nineteenth century there was far more sophistication than is usually supposed in the reporting of the foreign example in education. Her study confirms, as she puts it,

the existence of a broad spectrum of information about education abroad in a variety of sources and [it] supports assertions of expertise in educational comparison and an

active involvement of groups and politicians in the exchange and generation of information about educational provision elsewhere. (Sprigade, 2005, p. i)

In view of this and other evidence, it would be wrong in my view to dismiss interest in ‘policy borrowing’ as a manifestation of a phase of comparative education through which we passed long ago.

If a principal purpose of comparative inquiry in education is, to use a term favoured by W. D. Halls, ‘meliorist’, that is, to improve things (Halls, 1990, p. 23), then (as I have argued above) it involves ‘learning lessons’, seeking out good practice, identifying educational policy and practice that might be emulated, copied, ‘borrowed’, if you will.

But if the endeavour to learn lessons does result in attempts to borrow, comparativists need to understand the processes involved, to monitor what happens at the policy level, and to warn appropriately. On a previous occasion I listed some of the forces which might produce the conditions for an intention to borrow:

- Serious scientific/academic investigation of the situation in a foreign environment
- Popular conceptions of the superiority of other approaches to educational questions
- Politically motivated endeavours to seek reform of provision by identifying clear contrasts with the situation elsewhere (what Steiner-Khamsi calls ‘scandalising’ the situation at home)
- Distortion (exaggeration), whether or not deliberate, of evidence from abroad to highlight perceived deficiencies at home (a common feature of reporting in the popular press) (Phillips, 2000b, p. 299)

Below I shall look at examples of actual and potential transfer – at various levels of sophistication – between countries (with a particular focus on British interest in educational provision in Germany over a long period) and point to some heuristic devices to aid analysis of the processes involved.

Examples

An early example of serious attraction to a foreign example is to be found in an account written by John Quincy Adams of his travels in Silesia in 1800 and 1801 and published in London in 1804. Adams (1767–1848) was at the time the US Minister Plenipotentiary in Berlin; the son of an American President, he was to hold among other offices the post of Ambassador to Great Britain, to be elected to the Senate, and to become the sixth US President in 1825. Adams’s description of progress in elementary education in Prussia was later to be cited in England in a 1839 report of the Committee of Council, *Recent Measures for the Promotion of Education in England*, and is worth quoting in part as a good example of early interest in educational provision ‘elsewhere’ and the lessons to be learnt from it:

Adams writes appreciatively of the educational reforms of Frederick the Great: it was due to ‘the zeal with which he pursued the purpose of spreading useful knowledge among all classes of his subjects’, that compared to the United States,

[p]robably, no country in Europe could so strongly contest our pre-eminence in [elementary education] as Germany. (1804, p. 362)

He mentions in particular the training of teachers:

The teachers are directed to give plain instruction, and upon objects applicable to the ordinary concerns of life; not merely to load the memory of their scholars with words, but to make things intelligible to their understanding; to habituate them to the use of their own reason, by explaining every object of the lesson, so that the children themselves may be able to explain it, upon examination. (1804, p. 366)

And he cites the regulations in place for compulsory attendance and for inspection:

The school-tax must be paid by the lord and the tenants, without distinction of religions. In the towns, the school must be kept the whole year round. It is expected that one month shall suffice to make a child know the letters of the alphabet; that in two it shall be able to join them; and in three, to read. The boys must all be sent to school, from their sixth to their thirteenth year, whether the parents are able to pay the school-tax or not. For the poor, the school-money must be raised by collections. Every parent or guardian who neglects to send his child or pupil to school, without sufficient cause, is obliged to pay a double school-tax, for which the guardians shall have no allowance. Every curate must examine, weekly, the children of the school in his parish. A general examination must be held annually, by the deans of the districts, of the schools within their respective precincts; and a report of the condition of the schools, the talents and attention of the school masters, the state of the buildings, and of attendance by the children, made to the office of the vicar-general, who must transmit all these reports to the royal domain offices. From these, orders are issued to the respective landraths, to correct the abuses and supply the deficiencies indicated in the reports. (1804, p. 367–368)

This relatively enlightened reporting covers matters of great concern in the early decades of the nineteenth century, as the debate began about the nature of educational provision and in particular the involvement of the state in it. The detail here is important, since it provides a blueprint for possible emulation and can thus be seen as an early example of identifying ‘what works’ in another system. There is of course no intention to ‘borrow’ from experience in Silesia, but information of the kind collected by Adams was routinely fed into the policy discussion and was used by others advocating reform.

Let us move from the personal to the official. A 1834 House of Commons Select Committee Report on the promotion of education in England was to include evidence from witnesses who could give testimony on the basis of first-hand experience of education in Germany. Here is what appears to be a verbatim record of an interview with William Davis, who ran a school in Whitechapel, London (on the lines of Bell’s monitorial system). The context is a discussion about expanding educational provision in England and exploring ways in which such expansion had occurred in Germany.

Are you of opinion that it is exceedingly desirable that a more extended system of education should be established?

– Yes, if possible.

And that with that system of education a system of employment should be combined, so as to give children useful habits?

– Yes; perhaps it may not be irrelevant to observe I have known much about foreigners of the lowest class, who have come to England for employment, and I have scarcely known an instance where one of them (Germans) could not write his name and read his Bible.

You mean to say that there is a much larger proportion of foreigners than of English who can do that?

– I have scarcely found one in my own experience, among many hundreds whom I have known, who could not read and write.

Are the class of foreigners with whom you have been conversant as low as those in this country whom you have known?

– They come from the class of peasantry of their own country, and are here chiefly labourers to the sugar refiners.

Have you found the German sugar bakers who have come to this country better educated than men of similar stations of life, and similar occupations in this country?

– I should think upon the whole they are better educated. (*Report from Select Committee, 1834, p. 215*)

This exchange is also worth quoting in detail, since it provides evidence of serious official endeavour at an early period – a time when there was serious debate about the need to consider state intervention in education in England – to identify evidence that might account for the perceived superiority of provision elsewhere. It is an example of what Steiner-Khamsi calls ‘scandalising’ the home system.

Thereafter many official reports in England throughout the nineteenth century devoted much space to consideration of foreign examples in education, a habit which continued in the twentieth century. Michael Sadler’s Office of Special Inquiries and Reports produced a remarkable range of studies on multifarious aspects of foreign systems of education in the period 1895–1905, an initiative which was emulated from 1989 by successive ministries of education in London which published reports on education in other countries (including no fewer than eight on education in Germany). These reports can be related directly or indirectly to decision-making in the policy realm.

The London Borough of Barking and Dagenham provides an important modern case study of borrowing in England on a local scale. The Chief Education Officer of this local education authority (LEA) initiated an extraordinary plan to improve teaching in local schools by learning from foreign examples. A special study was made of mathematics teaching in Swiss schools where good practice was observed and analysed and then ‘copied’ by teachers in the LEA. This involved the active cooperation of schools and the training of staff in new teaching techniques, together with the development of explanatory handbooks. This unusual example of the successful ‘transplanting’ of good practice identified elsewhere into the home environment resulted in observable improvement in standards in mathematics in the LEA (Ochs, 2006).

In the United States we might mention the important work of Horace Mann, whose account of education in Germany was widely influential, that of Calvin Stowe (1838) and of Henry Barnard (1861, 1876), as well as William Torrey Harris's vast 'International Education Series'. Notably in the twentieth century there were important reports from the US Department of Education on education in Japan (1987) and Germany (1999), countries whose educational provision has attracted much attention around the world.

In France, the report on education in Prussia by Victor Cousin was hugely influential. Translated into English (by Sarah Austin), it received widespread coverage in reviews and reports and was used both positively and negatively in the policy debate over a long period (Cousin, 1864).

In Japan we can cite the curious instance of the Iwakura Mission. Led by Iwakura Tomoni, a Japanese delegation set sail for Europe and the United States in 1871 and spent 1 year and 9 months away from Japan. It comprised half the government of the day. The mission was huge (107 in all), and its objectives were wide-ranging: to present credentials to countries with which treaties had been concluded; to begin treaty revisions; and to observe and investigate advanced societies in order to determine what features of those societies might assist the modernisation of Japan. This latter objective became the principal aim of the mission. The embassy visited the United States, Britain, France, Belgium, The Netherlands, Germany, Russia, Denmark, Sweden, Italy, Austria, and Switzerland. It included an investigation of educational provision in the countries visited. A detailed report on the Embassy's travels and findings was put together by the Confucian scholar Kume Kunitake (1839–1931) and published in 1878 (*Tokumei zenken taishi Beiō kairan jikki*) (Kume, 2002).

In South Africa since the end of Apartheid we have seen the problematic import of 'outcomes based education' (OBE), despite worries about this style of teaching and learning in 'exporter' countries. This provides a good example of failure to learn from the foreign example and of insufficient attention to the importance of context. For OBE to work there has to be at an appropriate infrastructure in place to support it. To move swiftly from traditional modes of teaching and learning to a situation where a teacher could say to pupils 'I'm not the sage on the stage but the guide on the side' was seriously mistaken (Jansen, 2004; Spreen, 2004).

Elsewhere (Phillips, 2000b, pp. 302–303) I have listed the positive and negative use made of the German example during the nineteenth century in Britain. The positive features of German provision in education which attracted observers were:

- The coherent systematic nature of educational provision
- The unambiguity of the role of the state
- The high standards of basic education
- The long history and developing importance of vocational education
- The attention to technological education and research in the *Technische Hochschulen*
- The conceptualisation of the 'modern' university

On the negative side, there was concern about:

- The intervention of the state in matters which were seen by some observers to be quintessentially the concern of the people
- The overbearing nature of bureaucratic administration
- The overloaded curriculum and its departure (in the case of the *Gymnasium*) from the ideals of Wilhelm von Humboldt
- The tendency towards blind obedience which encouraged the state to be manipulative of education for its own political and military ends

The official voice has therefore been consistently heard pronouncing on positive and negative features of education elsewhere for the past 200 years and more. The task for analysts of policy transfer is to identify instances of actual ‘borrowing’ of policy and practice and then to attempt to explain the processes involved. There are some potentially very informative instances of transfer at various stages of what Kimberly Ochs and I have seen as a ‘spectrum’ (Figure 2) ranging from imposition to general influence.

At the extreme (‘imposed’) end of the spectrum we might look at instances of the imposition of foreign models on countries coming under authoritarian influence from outside, as in the case of the Soviet bloc countries after the Second World War, or in the case of colonised countries required to adopt approaches to education common in the countries of the colonisers. Next we can examine conditions in countries defeated in war and required by the occupying victors to introduce new measures – the cases of Germany and Japan after the War are relevant here. Further along the spectrum we can identify instances of countries being required to change policy and practice in return for aid of various kinds, from the World Bank, for example. Next comes the deliberate and voluntary ‘borrowing’, which we have defined as ‘the conscious adoption in one context of policy observed in another’ (Phillips & Ochs, 2004a, p. 774). Finally, there is the general influence of educational ideas, ranging from the power of theories of education developed by such figures of international status as Pestalozzi or Dewey or Piaget to the forces of educational globalisation.

Spectrum of educational transfer

Research

Given this rich historical background, there is a need to develop ways of analysing what happens in policy transfer of various kinds, and this is what many comparativists and others have been preoccupied with in recent years. In 1989, a special issue of *Comparative Education* investigated cross-national attraction in education (Phillips, 1989). The rationale for the papers included was that a commentator from country *a*, would write about that country's apparent interest in aspects of education in country *b*, while a knowledgeable observer from country *b* would react to the nature of country *a*'s attraction. Not surprisingly, there was considerable scepticism about the particular foci of attraction, as an OECD report had argued in a different context: "in nearly all countries, the reformers advocate following foreign models which their counterparts in the foreign country themselves criticise in the light of their experience of them" (Grégoire, 1967). Torsten Husén's contribution spoke of the example of reform in Sweden being 'exemplary both ways':

The reform-minded, particularly in Britain and the Federal Republic of Germany, who wanted to change in the same direction as Sweden, tended to regard the reform as exemplary. Those of a more conservative disposition were on the [look out] for weaknesses and failures, and tended to view it as exemplary in a negative sense. (Husén, 1989, p. 346)

This reminds us of Steiner-Khamsi's descriptors 'glorification' and 'scandalisation' in order to illustrate ways in which the foreign example might be used in the policy debate.

More recently Jürgen Schriewer and others in Berlin have investigated the internationalisation of educational ideas in connection with world system theory (Schriewer, 2000; Caruso & Tenorth, 2002). Schriewer's concept of 'externalisation' involves the use of foreign models in attempts to legitimise controversial reform proposals 'at home' (Schriewer, 1990).

Steiner-Khamsi has looked at policy borrowing using in particular examples from Mongolia and Ghana (Steiner-Khamsi & Stolpe, 2006; Steiner-Khamsi & Quist, 2000).

Beech (2005, 2006a, b), Tanaka (2003), Ochs (2005), Sprigade (2005) and Rappleye (2006) have examined a wide range of instances of policy transfer in many different contexts and at various times.

Kimberly Ochs and I have described models and other devices designed to analyse processes of policy borrowing, using for the most part British attraction to educational provision in Germany (Ochs & Phillips, 2002a, b; Phillips, 1989, 1993, 1997, 2000a, b, 2002, 2004, 2005, 2006b; Phillips & Ochs, 2003a, b, 2004a, b). Other edited volumes (Finegold *et al.*, 1993; Steiner-Khamsi, 2004; Phillips & Ochs, 2004b; Ertl, 2006; Phillips, 2006c) have covered policy transfer issues in a variety of present-day and historical contexts. The historical approach is especially important, since it allows us to analyse completed processes: the work of Caruso (2002) on foreign adoption of the Bell-Lancaster ('monitorial') system in the nineteenth century is a good example.

The devices which Kimberly Ochs and I have produced in Oxford have been concerned with the description and analysis of stages in the policy-borrowing process. We have postulated a four-stage model describing processes of attraction, decision, implementation, and internalisation (Phillips & Ochs, 2003a, 2004a, b), and we have described ‘filters’ or ‘lenses’ through which policy (or practice) might pass as it transfers from one location to another: ‘ideas move and morph’, as Cowen puts it (2006, p. 567). These devices are not supposed to be applicable to each and every case of borrowing/transfer, but simply to serve as a tool for researchers to use as they trace what has happened or is happening in cases of educational transfer in a variety of contexts. They have been described at length in the papers cited above and are reproduced here as Appendices 1 and 2.

Prospects

I began by asserting the significance of policy borrowing as a theme in comparative education and the importance of the aim of ‘learning lessons’ through comparative inquiry in education. So far I have not touched in detail upon globalisation, but it is clear that more than ever against the background of globalising tendencies there will be instances of the transfer of educational ideas – deliberately or not – between locations. There will be cases of seemingly irresistible imperatives driving such transfer, as has been seen in the interesting situation with the Bologna Process in education in Europe, where long-standing traditions are potentially giving way to a consensual standardisation.

Here the aim is the creation, by 2010, of a ‘European Higher Education Area’, with comparability and compatibility of provision from country to country. Ministers of Education met in Bologna in 1999 and have had a series of meetings since in order to take forward a programme involving the adoption of a three-cycle system of bachelor, master, and doctoral degrees and to agree on common approaches to quality assurance and the mutual recognition of qualifications and their associated periods of study. They agreed a remarkable series of objectives and declared:

We hereby undertake to attain these objectives – within the framework of our institutional competences and taking full respect of the diversity of cultures, languages, national education systems and of University autonomy – to consolidate the European area of higher education. To that end, we will pursue the ways of intergovernmental co-operation, together with those of non governmental European organisations with competence on higher education. We expect Universities again to respond promptly and positively and to contribute actively to the success of our endeavour. (Bologna Declaration, 1999)

The stage is set for an extension of processes observable since the creation of the European Community towards an ever-closer degree of cooperation, of convergence, between the member states and the nations of Europe beyond the European Union. It is this kind of convergence that it will be important for comparativists to monitor, in

particular to test Cowen's notion of 'moving and morphing' – to what extent will the notions underpinning the agreement be affected by local contexts?

Contexts are of course the key factor in analyses of policy transfer. Sadler reminded us of this in 1900, and others had done so in various ways before him. A difficult but important task for future research is to disentangle the contextual factors that aid or hinder educational transfer. This will involve detailed investigation of the 'internalisation' stage in the model described in Appendix 1.

Equally important will be an investigation of the roles of what in that model are seen as 'significant actors' (individuals and institutions) in promoting or hindering the transfer of policy and practice. Reportage in all forms will play a part in transfer processes, as we have seen in the case of worldwide interest in Finland, following that country's egregious success in the PISA surveys, or in the case of Germany, as a result of very disappointing performance in PISA. This too needs to be monitored and critiqued.

There is now a rich body of work on educational transfer upon which to build, and the further development of case-based theory in this important area of comparative inquiry will no doubt help to underline the continuing importance of the study of comparative education and the relevance of comparative data to the processes of policy making.

Summary

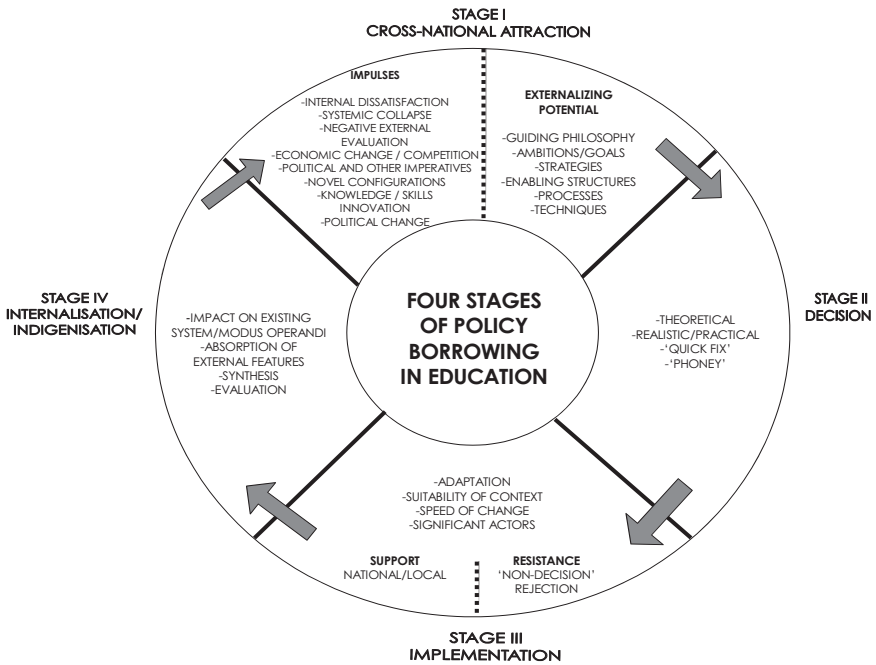

This survey of aspects of policy transfer in education has attempted to cover a lot of ground in a short space. In summary, I may attempt some conclusions:

- It is important to be clear about the terminology used when discussing transfer, much of which is potentially problematic; 'borrowing' is only one feature in a spectrum of possibilities for educational transfer.
- 'Borrowing' should be seen as a purposive phenomenon, where deliberate attempts are made to learn from the foreign example and to 'import' ideas in the shape of policy and practice into the 'home' system.
- A significant feature of the examination of foreign approaches to educational problems, whether or not they are 'borrowable', is that they help us to better understand problems 'at home'.
- In analysing ways in which borrowing takes place it is essential to tackle the difficult question of context and its appropriateness in terms of accommodating imported policies and practices.
- An important task for comparativists is to uncover the motives of those advocating the borrowing of aspects of educational provision elsewhere.
- With a seemingly irresistible and increasing convergence in education in a globalising context, tensions between the global and the local, between standardisation and tradition, will be evident and will constitute a rich area for future investigation.

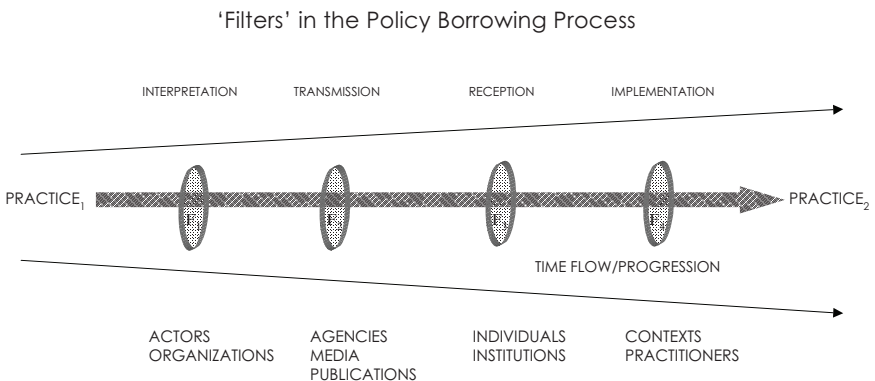

The centrality of educational transfer as a field of analysis and inquiry in comparative education is established. It is the task of comparativists to make sure that it continues to be researched in ever-new contexts.

Appendices

1. Four stages of policy borrowing (Phillips & Ochs, 2003a, b; 2004a, b)

2. Filters in the policy-borrowing process (Phillips & Ochs (Eds.), 2004b)

AGAMEMNON CONTRA PROMETHEUS: GLOBALISATION, KNOWLEDGE/ LEARNING SOCIETIES AND PAIDEIA IN THE NEW COSMOPOLIS

Andreas M. Kazamias

Introduction: The Hypothesis/Plot and the Mythical Way of Knowing

This presentation “theorizes” about, and views critically, the undemocratic and dehumanizing consequences of the unfolding “Brave New Cosmopolis of Globalization” (BNCG) and the Information/Technological Knowledge/Learning Society (ITKLS)”. Using the ancient Greek myths of Agamemnon and Prometheus, it is presented as a *duology* (a two-episode performance) whose “hypothesis-plot” is twofold: (a) the “dehumanizing” and “depoliticizing” consequences of globalisation and the ITKS on knowledge, learning, education, society and the individual, and (b) the “reinvention” or “re-enchantment” of humanistic *paideia* through the cultivation of what may be called Promethean Neo-Humanism, in order to “humanize” the *anthropos-politis* (citizen-person/human) in what may otherwise be referred to as the Knowledge/Learning Cosmopolis (KLC).

In the first episode, entitled “Globalisation, Knowledge Society, and the Sacrifice of Humanistic *Paideia* —The Agamemnon Syndrome”, I shall use the myth of Agamemnon, as dramatised in Euripides’ *Iphigenia at Aulis* to view critically the “dehumanizing” effects of globalisation and Information Technological Epistemological Paradigm (ITEP), specifically the danger of constructing a *homo faber/homo fabricatus* (Jurgen Habermas) or *homo barbarus* (Heidegger) and a *homo economicus* type of citizen, rather than a *homo civilis/homo humanus* citizen (Martha Nussbaum). In the second episode, “Prometheus Unbound: Promethean Neo-Humanism and the Reinvention of Humanistic *Paideia*”, I shall use the myth of Prometheus as dramatised in Aeschylus’ *Prometheus Bound* to argue for the “re-enchantment” or “reinvention” of humanistic *paideia*/learning as a means of empowering, liberating and “humanizing” the *anthropos politis* (citizen-person) in the emerging Knowledge/Learning Cosmopolis (KLC).

The Mode of Analysis: Combining *Mythos* with *Episteme*

The mode of analysis in this *duology* combines *mythos* (myth) with *episteme* (human science) and uses symbolic representations or images. We make use of two classical Greek myths for a twofold purpose: (a) as a device or tool to dramatise a particular

problem or human condition – this, hopefully, being the emotionally stirring element; and (b) as a way of knowing, thinking and expressing, in order to “theorize” and interpret a problem the full significance of which can be revealed symbolically through an imaginary or transcendent form of discourse. Myths, *icons* (representations or images) and symbols constitute, in the words of Vitsaxis, a Greek scholar, “that transcendent language which extends reflective thinking and leads it to imaginary spaces”. A myth, according to the same writer, “is nearer to the intuitive and aesthetic rather than the ‘logocratic’ approach or understanding of the phenomenological world”. Also, myth can even be ‘unorthological’, in the sense of not obeying certain “fixed” rules, without, of course, being “irrational”. Myth, according to Claude Levi-Strauss, the eminent social anthropologist, is an ‘aesthetic’ way of knowing, parallel or analogous to an ‘objective’ way of knowing. “Through myth, an aesthetic access to knowledge is realized” (Vitsaxis, 2002, pp. 15–21). And, according to P. Feyerabend: “The sharp distinction between science and non-science is not only artificial but also catastrophic for the progress of knowledge. If we want to understand nature ... we must make use of all methods and ideas and not just a small selection. The assertion that there cannot be knowledge outside science – *extra scientiam nula salus* – is but a useful myth” (Feyerabend, 1975; also see Bowra, 1957, pp. 127–128).

Episode One: The Agamemnon Syndrome, Globalisation, Knowledge/Learning Society and the Sacrifice of Humanistic *Paideia* in the Brave New Cosmopolis

Prologue – the Myth of Agamemnon

In *Iphigenia at Aulis*, Agamemnon of the House of Atreus and King of Argos, the commander-in-chief of the Greek expedition to Troy was enjoined by the gods to sacrifice his daughter Iphigenia so that favourable winds would blow and the huge armada, anchored at the port of *Aulis*, could set sail on its deadly voyage. The expedition to sack Troy was ostensibly for the purpose of avenging the insult to the Achaeans (the Greeks) and the House of Atreus that was perpetrated by the abduction (not unwilling) of Helen, a “civilised” Greek princess and Agamemnon’s sister-in-law, by an oriental “barbarian,” the Trojan prince Paris. But there was more to the expedition than mere retribution for an insult. The Trojan War was also sparked by the Greek arrogance of power as personified in the imperious Argive King, and was waged for national pride, aggrandizement, wealth, power and glory, “for the common good of Hellas”, as the transformed heroine Iphigenia declared on the way to the altar to be slaughtered. The dramatic poet Euripides uses the myth of Agamemnon to “theorize” and critically interpret the politico-social conditions and problems of the democratic city of Athens during a turbulent period of its history, that is, towards the waning years of the fifth century BC.

Like Euripides, but without his dramaturgical artistry, I shall use the myth of Agamemnon and the sacrifice of Iphigenia as a methodological device to make a comparative and critical interpretation of a politico-economic and sociocultural phenomenon that is in the forefront of contemporary discourse and social policy worldwide.

This, simply stated, is the problem of education and more broadly *paideia/culture/Bildung* in the New Cosmopolis of what may be called “Neo-Liberal Modernity”. Reflecting on contemporary trends in this sociocultural area, I shall try to unfold the following plot.

In order for contemporary nation states and “international regimes” like the European Union (EU) to participate effectively and competitively in the New Cosmopolis, as a globalized Knowledge Society (KS) and a world economic system, modern systems of education, as state-steering mechanisms, are called upon to emphasize certain types of knowledge and culture at the expense of conventional others. In order to respond effectively to the demands and challenges of globalisation and the associated Information/Technological Epistemological Paradigm (Castells), secondary schools, and more so universities are being transformed in their identity and role. From socio-cultural enclaves, a main function of which has been a holistic/well-rounded education or *paideia* – intellectual, moral and civic – they are being metamorphosed into sites for the production of instrumental knowledge, techno-science and the acquisition of marketable skills. In such transformation, their mission becomes less the formation of the *anthropos-politis* (citizen-person), with a cultivated “mind and soul”, and more the construction of the informed, efficient and skilled “knowledge worker” for the competitive world economic markets. Schools and universities are being transformed from sites of *paideia* to places for what Jane Roland Martin, an American educational philosopher, has called education for mainly “productive processes” (Martin, 1994, p. 78), and what Aronowitz, an American sociologist, has called “Knowledge Factories”. Especially in the case of the modern university (the European and the North American), the “Idea of the University” has been changing from one whose function has been mainly “educational” and “cultural” – the provision and cultivation of “liberal education”, *Bildung*, *culture generale* or *paideia* – to one whose main function is developing to be the promotion of “instrumental rationality” and what the postmodernist French thinker Lyotard has called “performativity” (Lyotard, 1984). To use Robert Cowen’s apt terminology, the modern university is being transformed to “the market-framed university” (Cowen, 1996, 2000).

The Brave New Cosmopolis of Globalisation and the Information-Technological Knowledge/Learning Society

In theorising about the new *cosmos* that is unfolding before us, as we enter the third millennium, social theorists have constructed various and in some respects overlapping conceptual-epistemological schemata. One of the most illuminating such constructions is that of the Spanish sociologist Manuel Castells, who wrote:

A new world is taking shape at this turn of the millennium. It originated in the historical coincidence, around the late 1960s and mid-1970s, of three independent processes: the information revolution; the economic crisis of both capitalism and statism, and their subsequent restructuring; and the blooming of cultural social movements, such as libertarianism, human rights, feminism, and environmentalism. The interaction between these processes, and the reasons

they triggered, brought into being a new dominant social structure, the network society; a new economy, the informational/global economy; and a new culture, the culture of real virtuality ... [defined] as a system in which reality itself (that is, people's material/symbolic existence) is fully immersed in a virtual image setting, in the world of make believe, in which symbols are not just metaphors, but comprise the actual experience (Castells, 1998, 2000, pp. 367, 381).

Central in much of the relevant discourse about the new world that is taking shape at this turn of the millennium are concepts such as: 'globalisation', 'global society', 'global informational economy', 'knowledge societies' and 'knowledge-based economies', 'learning and information societies', 'network society', 'global education', 'culture of real virtuality', and the like (Castells, 2000; Lofstedt, 2001; Barney, 2004). And among such constructions, the concepts of "globalisation" and 'knowledge/learning society/societies' seem to be particularly prominent (Waters, 1995; Lofstedt, 2001).

Globalisation – Blessing or Curse?

Globalisation is a *protean* concept, not amenable to essentialist definitions or interpretations. Like the mythical demigod Proteus it wears different conceptual and ideological attire, depending on one's theoretical and ideological orientation. And like other all-encompassing cosmic theoretical constructions globalisation is a contested and controversial concept. Some social theorists have questioned its very authenticity, calling it a "chimera" (Vergopoulos, 2000), or a "mythology" (Tombazos, 1999). To such skeptics, globalisation has deep historical roots. It has always been there, at least since the advent of modernity in the eighteenth century, even earlier. The majority of scholars, however, social theorists and informed observers, to a degree more or less, have accepted globalisation as an economic, social and cultural historical reality, whose scope and intensity are quite recent. For example, in his recent political manifesto *The Third Way*, Anthony Giddens, the English sociologist, has written:

Economic globalization therefore is a reality, and is not just a continuation of, or a reversion to the trends of previous years. While much trade remains regionalized, there is a 'fully global economy' on the level of financial markets ... Globalization ... is not only, or even primarily, about economic interdependence, but about the transformation of time and space in our lives. (Giddens, 1998, pp. 30–31; 1999/2000, p. 28)

In the same vein as Giddens, Anthony McGrew, has conceptualized globalisation as an all-encompassing social, economic and cultural reality. According to McGrew, "Transnational networks, social movements and relationships are extensive in virtually all areas of human activity from the academic to the sexual" (McGrew, 1992, pp. 65–66; also see Scholte, 2000, pp. 15–16). Ka Ho Mok's definition appears to command wide acceptance:

While there is not a single, consensual definition of globalization, it is evident that the whole world is undergoing ‘a set of processes which in various ways – economic, cultural, and political – make supranational connections.’ In addition, the impact of globalization has not only been felt in the economic realm but, indeed, has also caused significant changes in the ideological-cultural realm and in the transformation of time and space. Even though no country is immune from the impact of globalization, heated debates have been held about the positive and negative consequences of globalization (Mok, 2000, pp. 148–49).

Within the category of globalisation theorists, however, there are different assessments as to the effects of globalisation on the economy, the polity, society, education and culture, and, more generally, on “human life”. Some critical social theorists and intellectuals tend to emphasize what may be called the “discontents” of globalisation, namely, its negative and ‘dehumanising’ effects on society and human existence. Thus, for example, in a study bearing the telling title of *Predatory Globalization*, Richard Falk examined “the effects of economic globalization on the capacity of the state to contribute to human well being”, and concluded:

Yet, despite these encouraging tendencies the structural and normative foundations of world order seem increasingly unable to provide minimum security for many of the peoples of the world. The state is being subtly deformed as an instrument of human well being by the dynamics of globalization, which are pushing the state by degrees and to varying extents into a subordinate relationship with global market forces. Partly in reaction to these developments and partly as a result of the shortcomings of secularism as a source of human fulfillment, the state is also losing its capacity in many settings to provide the social, economic, and physical ingredients of security within its own borders (Falk, 1999).

According to the French political philosopher Pierre-Andre Taquieff, globalisation can be described as an “empire of liberalized markets” which, while contributing to the increase of the world product on the one hand, has negative socio-economic and political consequences, on the other, such as a widening of the gap between the economically developed rich North and the underdeveloped poor South, and internally in the wealthiest nations, an increase in inequalities and social exclusion. In the political realm, Taquieff comments further, globalisation transforms the physiognomy of democracy and democratic citizenship to a “market democracy”, and restricts the public sphere (Taquieff, 2002, p. 107; also see Bauman, 1998, p. 66).

Other social theorists conceptualize globalisation as ‘neo-liberal globalization’ with all that ‘neo-liberalism’ as a politico-economic doctrine or ideology connotes and/or denotes. Thus, for example, according to Nelly Stromquist, “neo-liberalism emphasises three policy prescriptions: deregulation, privatisation, liberalisation” (Stromquist, 2002, pp. 25–26; also see Slaughter, 1998, p. 52). Finally, T. Fotopoulos brings out the corrosive effects of neo-liberal globalisation on ‘democracy’. He notes that “in contrast to the Liberal Old Right that was founded on tradition, hierarchy and political philosophy, the Neo-Liberal New Right’s credo was based on blind belief in the market forces,

individualism, and economic ‘science’”. According to Fotopoulos, “the neoliberal movement ... represented a powerful attack against social-democratic statism”. The main policies proposed by neo-liberals first in England and the United States by the administrations of Margaret Thatcher and Ronald Reagan, and “later by governments all over the world”, have included: “Liberalisation of markets; privatisation of state enterprises; reduction of the welfare state into a safety net and parallel encouragement of the private sector’s expansion into social services (health, education, pension schemes and so on); redistribution of taxes in favor of high income groups” (Fotopoulos, 1997, pp. 33–36).

We tend to concur with the aforementioned views about the empirical reality of globalisation. In any case, whether it exists in reality or not, globalisation has become a legitimization concept in contemporary discourses and policies relating to national economies, and to national-state management of public services, in general. Unsurprisingly, and more pertinently for our purposes here, it has also been used as a legitimization concept in discourses and policies in the restructuring and reform of systems of education be it the school curricula and pedagogies, assessment and evaluation, student achievement or school governance. In this sense, therefore, that is, as part of the rationale that is often used to justify reforms in education, globalisation may be said to have indeed acquired an “ontological” existence (see Davies & Guppy, 1997, p. 435).

Knowledge Society (KS)

As with globalisation, Knowledge Society (KS) has become a dominant discourse in the unfolding New Cosmopolis. The significance of ‘knowledge’ and ‘information’, as activating forces in the New Cosmopolis, has been stressed by several social and political analysts of different ideological and epistemological persuasions (Bell, 1976, 1980; Castells, 1989; Drucker, 1993). Andy Hargreaves has recently conceptualised KS in terms of three dimensions:

First, it [KS] comprises an expanded scientific, technical and educational sphere. ... Second, it involves complex ways of processing and circulating knowledge and information in a service-based economy. Third, it entails basic changes in how corporate organizations function so that they enhance continuous innovation in products and services, by creating systems, teams and cultures that maximize the opportunities for mutual, spontaneous learning (Hargreaves, 2003, p. 9).

KS, in short, and such other coextensive concepts as ‘Information Society’ and ‘Learning Society’, could be said to be societies where the promotion of knowledge has become a dominant discourse as a determining factor in economic, social and individual development, and where “the fundamental distinction among people will not be between the haves and the have-nots, but between those who know and those who do not know” (Stamatis, 2005, p. 115; Kladis, 1999, p. 82; Kazamias, 1995; Commission of the European Communities, 1993).

As with globalisation, there are variations in the conceptualisation of KS. However, in the prevalent discourse on the subject, the following *epistemic* elements appear to be salient and given greater emphasis:

- Enormous development of ICTs and sophisticated learning technologies; the rise of the Network Society (Castells, 1996, 2000)
- Increasing importance of information technologies and “codified knowledge” for the accumulation of capital and for sustainable development in a competitive global economy
- Techno-scientific instrumental rationality
- Knowledge as a trading commercialised commodity
- Changing forms of organisation of living and work (a ‘learning organization’, a ‘flexible workforce’, a ‘knowledge worker’)
- The emergence of new patterns of exclusion/inclusion (e.g., the “digital divide”)

Globalisation, therefore, as well as KS, whether real or imaginary, is quite germane to our saga. It constitutes the context/matrix in the transformation of educational discourses (policy talk and policy practice), and what we may call ‘educational cultures’. But from our mythical way of thinking – the *Agamemnon Syndrome* – globalisation, particularly its “economistic” and rationalistic aspects, is also metaphorically viewed as a “curse” or as an *anomia* (anomie) that propels into action certain choices in education at the sacrifice of long-cherished others. Such choices may indeed bring about glory and benefits. Some, for example, have argued that globalisation contributes to ‘well-being’, that it blurs ‘inequalities’, and that it makes countries economically stronger and more competitive (Andrianopoulos, 2004, p. 14). In the same vein, OECD, the powerful Organization for European Cooperation and Development, sees nothing but good benefits accruing from the evolving global economy and the concomitant global market space: economic growth, material progress, increased prosperity and human welfare, political stability and greater equality (Spring, 1998, p. 160).

In the Greek myth, Agamemnon’s decision to sack Troy resulted in benefits and spoils – mostly material, but also glory. But, such benefits accrued at a very high human cost. In addition to impelling the sacrifice of his daughter Iphigenia, Agamemnon’s course of action had other tragic consequences: the complete destruction of the city of Troy, the rape and enslavement of the Trojan women, the slaughter of noble men and women and, after Troy, the murder of Agamemnon himself by Clytemnestra, his wife, and then Clytemnestra’s murder by her son Orestes. In our story, educational policies, as impelled by globalisation and the KS, could also have dire and dehumanising consequences.

Conquering Troy and Gaining the World – Educational Reform Discourses in the Knowledge/Learning Cosmopolis – Towards the Homo Economicus and the *Cyborg* Citizen?

As indicated in recent studies, as well as in important texts by international organizations such as the EU, OECD, the World Bank and UNESCO, the dominant educational reform discourse, as rhetoric (*logos*) and as framework for *praxis* at the macro level of public policy and the micro level of schooling, is pervaded by a predominantly economistic “ethos”, instrumental rationality, neo-liberal values and a business ethic.

These ideas and values can be said to inhere in such terms as efficiency, competition, output, yield, markets, liberal individualism, destatisation/ deregulation, privatisation, marketization, entrepreneurship, and the like. Below we refer to only a few such narratives from the international world of education.

- (a) In an international survey of “new educational proposals for the global economy,” involving the geo-cultural regions/rims of North America (the United States), Europe (the United Kingdom and the European Community), and East Asia (Japan and Singapore) and international organisations such as the OECD, the World Bank and UNESCO, Joel Spring documents the contemporary dominant discourse (policy talk and policy practice) on the interdependent relationship between education and the global economy as follows:

Education and the global economy are envisioned as having an interdependent relationship. Competition in the global economy is dependent on the quality of education, whereas the goals of education are dependent on the economy. Under these circumstances, education changes as the requirements of the economy change. As a result, human capital theory now dominates discussions of education for the global economy (Spring, 1998, p. 6).

Referring to certain educational reform discourses and policies, e.g., school or parental choice, national curricula, national and world-class academic standards, and national achievement tests during the heyday of neo-liberalism and the New Right in the United States and the United Kingdom in the 1980s and early 1990s, Spring has written: “The free market ideas of Friedrich von Hayek provided the underpinnings for discussions of school choice, national standards and curricula, eliminating the welfare state, and lifelong learning in the United States and the United Kingdom” (Spring, 1998, pp. 123, 128).

- (b) Similar discourses and policy statements are reflected in texts on the larger European scene. Of relevance in this connection, is the educational discourse in the various texts (white papers, green papers, resolutions, directives, circulars, conclusions and programmes) of the EU. In many of these EU “education and training” documents emphasis is placed on the development of skills and “competencies” to meet the needs of the Single European Market, an integrated European “knowledge society” and a European “knowledge-based competitive economy”. Although in some of the texts reference is made to “solid broad-based education” and to a “broad knowledge base”, what is also salient in them is the privileging of certain kinds of knowledge, skills and competencies (e.g. education in ICTs, techno-scientific instrumental rationality and vocational skills) for “competitive advantage”, that is, for the EU “to become the most competitive and dynamic knowledge economy in the world, capable of sustainable economic growth accompanied by quantitative and qualitative improvement of employment and of greater social cohesion”. Such an instrumentalist knowledge bias can easily be inferred from the “Communication to the Council and the European Parliament”, entitled *Towards a Europe of Knowledge* that was issued in 1997:

Noting that we are entering the “knowledge society”, the Commission in its *Agenda 2000* proposes making the policies which drive that society (innovation, research, education and training) one of the four fundamental pillars of the Union’s internal policies ... Economic competitiveness, employment and the personal fulfillment of the citizens of Europe is no longer mainly based on the production of physical goods, nor will it be in the future. Real wealth creation will henceforth be linked to the production and dissemination of knowledge and will depend first and foremost on our efforts in the field of research, education and training and on our capacity to promote innovation. This is why we must fashion a veritable ‘Europe of Knowledge’ (Commission of the European Communities, 1993).

The focus on “instrumentalism” and the “technological option” in the EU discourse on education and training, while at the same time emphasising “through symbolism” attachment to the humanistic cultural and epistemological tradition, is also evident in the various EU Action Programmes, namely, SOCRATES, LEONARDO DA VINCI, ERASMUS, ARION and COMENIUS. These initiatives, which covered virtually every aspect of the education and training systems, induced students, educators, education officials and policy-makers in the member states into the logic of seeking European funds to fulfil their educational expectations, in order to comply with the instrumental rationality of the EU guidelines. For the countries of the European South, the dependence on EU subsidies was enhanced even further by the funding channelled to national education systems from the European Cohesion Funds (the European Social Fund and the European Fund for Regional Development) on the basis of state-proposed “Community Support Frameworks”. These mechanisms subsidise national education policies which fall directly within the logic of the previously mentioned White Papers, promoting certain types of economic and social development and leading towards the envisaged ‘knowledge society’ and the ‘knowledge-based economy’.

In grappling with the putative commitment of developing an active European citizen in the globalised new European Cosmopolis, the European Commission was clearer about the cognitive and instrumental competencies than the ‘character’ traits and civic virtues or dispositions of the imagined/constructed citizen in the new ‘Europe of Knowledge’ (The European Commission, *Education and Active Citizenship – Learning for Active Citizenship*, 2001; Commission of the European Communities, 1995; Field, 1998).

(c) Several of the aforementioned core ideas and values are to be found in texts and pronouncements by other international organisations such as the OECD and the World Bank. The OECD, for example, has accepted globalisation “as the dominant trend in the world economy “and the creation of “a borderless global market system”. More than that, as noted above, the OECD sees nothing but good benefits accruing from the evolving global economy and the concomitant global market place. OECD’s educational discourse and policies are connected to what we have previously referred to as the economistic and rationalistic aspects of globalisation. These are well summarized as follows:

Education plays a dual role in OECD's plans. First, education is to aid the development of market economies through human resource development and lifelong learning. Second, education is to remedy problems resulting from globalization such as unemployment, increasing economic inequality, and fears of social and economic change. This dual role is similar to the function of education in European Union policies (Spring, 1998, p. 160).

More recently (2002), OECD's economic and instrumentalist approach to education and training was reiterated in a policy text published on the occasion of the creation of a separate Directorate for Education by the OECD Secretary-General "in recognition of the increased importance of education policy by member governments". In the words of Barry McGaw, the Director of this unit:

Contemporary societies demand high levels of knowledge and skills. Individuals without them have difficulty in participating effectively in social and economic life, so equity in education is as much a concern as quality. The knowledge and skills demanded [in a global economy] also change, making lifelong learning an increasing necessity. The OECD's work on education uses a lifelong perspective, shifts the focus from teaching to learning and connects education policy with economic and other social policies (OECD, 2002, p. 7).

- (d) Educational reform discourses and policies that put high premium on efficiency, performativity, instrumental rationality and knowledge production, marketable schooling and values can also be seen in such differing countries as Japan, Singapore, Hong Kong, Greece, Cyprus, and Turkey (for Greece, see Kazamias, 1998; for Cyprus, see Kazamias, 1994, 1999; for Hong Kong and Singapore, see Mok, 2000, pp. 150–151, 172 and Spring, 1998, p. 86; for Turkey, see OECD, 1989, pp. 12–14, 93–99; Zorlu-Durukan, 1999 and Turkish Ministry of Education, 2006; for Japan, see Green, 1999).
- (e) It is pertinent here to refer to Andy Hargreaves' insightful observations about the contemporary reform discourses on teaching {and education} in the 'knowledge society' and the related 'knowledge-based economy.' In his *Teaching in the Knowledge Society: Education in the Age of Insecurity* (2003), Hargreaves argues that contemporary capitalist societies that are also knowledge-based economies serve primarily the private good, and their schools are geared to develop primarily cognitive learning, instrumental skills and competencies for a KS and a knowledge economy. But a knowledge-based economy, according to him, is "a force of creative destruction". On the one hand, "it stimulates growth and prosperity," but on the other, "its relentless pursuit of profit and self-interest also strains and fragments the social order". In the knowledge-based economy, school systems "have become obsessed with imposing and micromanaging curriculum uniformity", instead of "fostering creativity and ingenuity". Hargreaves continues: "In place of ambitious missions of compassion and community, schools and teachers have been squeezed into the tunnel vision of test scores, achievement targets and league

tables of accountability. And rather than cultivating cosmopolitan identity and the basic emotion of sympathy, which Adam Smith called the emotional foundation of democracy, too many educational systems promote exaggerated and self-absorbed senses of national identity” (Hargreaves, 2003, pp. xvi–xvii).

- (f) Lastly, some additional observations regarding the transformation of higher education in the epoch of globalisation are pertinent here. A recent OECD study has noted that “tertiary education is changing to address client and stakeholder expectations, to respond more actively to social and economic change, to provide for more flexible forms of teaching and learning, to focus more strongly on competencies and skills across the curriculum” (OECD, 1998, p. 49). To these characteristics one could add related ideas such as Cowen’s “market-framed university”, Lyotard’s “performativity”, and others, for example, ‘entrepreneurial university’, and the ‘commercialization of university education’. Cowen’s characterisation of the market-framed university is illuminating:

Epistemologically, the market-framed university must deliver marketable, saleable, pragmatically useful knowledge. The market-framed university exists within a knowledge-market, and it must respond to the demands of its clients and customers (e.g., students; research funders). The knowledge production of the university must also be measurable—otherwise performance cannot be judged. Thus managerial decisions must be taken about the differential worth of knowledge products, against rules and criteria which are externally mandated” (Cowen, 1996; also see Cowen, 2000).

The Agamemnon Syndrome – An Epimythion

In the ‘Brave New Cosmopolis of Globalisation’ and the ‘Information/Technological Knowledge Society’, particularly economically advanced societies such as the United States, Germany, England, Australia, Japan and the other so-called Asiatic tigers (Singapore, Hong Kong, Korea and Taiwan), which depend more and more on scientific and technological knowledge, in order to participate effectively and competitively in the New Cosmopolis, are called upon to put most of their ‘knowledge eggs’ in the ‘techno-scientific basket’. As a consequence, they put pressure on those educational institutions traditionally responsible for the production and dissemination of knowledge, namely, the schools but more so the colleges and universities, to put a heavier premium on ‘techno-scientific’ knowledge and instrumental rationality. In turn, the university becomes hitched onto the wagon of the economy, its traditional autonomy is eroded, and so is the modern liberal-cultural ‘idea of the university’. In short, we observe the transformation of the modern university from a *studium generale* to a *studium speciale*, where narrow techno-scientific specialism and instrumentalism have supplanted and overshadowed what in English has been known as ‘liberal education’, specifically the ‘liberal humanistic canon’, in German as *Bildung und Wissenschaft*, and in Greek as *paideia* (Kazamias, 1997, pp. 39–42).

The ‘Humanistic Sacrifices’: Social Justice, Citizenship and the *Paideia* of the ‘Soul’

The crisis and reform discourse in education—‘policy talk’ and ‘policy practice’—presented above, provide us with an excellent modern scenario to use the ancient myth of Agamemnon in our critical interpretation of this contemporary politico-economic and sociocultural phenomenon. In the ancient myth, Agamemnon was ‘cursed’ because of a family ‘hubris’ which, as dramatised by Euripides, meant that for revenge, but also for glory, aggrandizement and the ‘good of Hellas’, he had to follow a course of action that necessitated the sacrifice of his daughter with ultimately tragic consequences. For such a quest, the human soul, personified in Iphigenia, had to be sacrificed. In our ‘drama’, we look at globalisation as a ‘curse’ or an ‘anomia’, as an imperial ‘knowledge power’ which enjoins the construction of a certain reform discourse in education. We hypothesise that in the Brave New Cosmopolis of globalisation and the Information-Technological KS, the hegemony of this educational *discourse*—as *logos* and as *praxis*—may indeed bring about wealth and “sumptuous spoils”, as in bidding farewell to Agamemnon in the closing stanzas of Euripides’ tragic drama, the chorus of Greek women had enigmatically intoned. But, we further argue, the type of *education* and I may add pedagogy demanded for such global knowledge cornucopia exacts several negative, in our judgment, costs or ‘discontents’. Among such ‘discontents’, or, from our mythical way of thinking, ‘sacrifices’, three ‘humane/ humanistic’ sacrifices are especially noteworthy: (a) the erosion of the public sphere, democracy, and democratic citizenship; (b) the ‘de-professionalisation’ and ‘deskilling’ of teachers; and (c) the sacrifice of humanistic knowledge and what may metaphorically be called ‘the *paideia* of the soul’.

The erosion of the public domain, democracy and democratic citizenship; possessive individualism and the “Faltering” of Democracy” (Jean Elshtain, 1995).

As analysed above, many social theorists, political economists and other commentators conceptualise globalisation as emphasising “markets, the private sector, and possessive individualism” as engines of economic growth in an increasingly competitive world. Hence the appellations “neo-liberal globalization” (e.g., Stromquist, 2002, Fotopoulos, 1997, Giroux, 2002), “market fundamentalism” (e.g., Soros, 1998) and “McWorld” (e.g., Barber, 1995), and such policy prescriptions as “deregulation”, “loss of nation-state sovereignty” (Bauman, 1998 and 2002), “liberalization”, and “privatization”. As a consequence of this emphasis, as Falk has argued, “the political is erased in the face of the economic”, and, among other things, “the state is being subtly deformed as an instrument of human well-being”. The state is also “losing its capacity in many settings to provide the social, economic and physical ingredients within its own borders”, the public domain is being restricted, and democratic institutions are weakened (Falk, 1999, pp. 49–51).

In a similar vein, Taquieff, the already referred to French political philosopher, has written:

The process of globalization, which is always accompanied by the symbolic representation of a messianic and pale utopian ideology of salvation through techno-commercial action, renders illegal the political while legitimizing absolutely

the technical/ technological, the economic and monetary. The social fabric/cohesion is dissipated, and is only replaced by the interactions of free exchanges. The political is erased in the face of the media and the market, while the democratic institutions are weakened (Taquieff, 2002, p. 16).

According to Benjamin Barber, in the McWorld “justice yields to markets”. McWorld “eschews civil society and belittles democratic citizenship”, and is indifferent to “civil liberty”. In metaphorical language, Barber adds: “If the traditional conservators of freedom were democratic institutions and Bills of Rights, the new temples of liberty, George Steiner suggests, will be McDonald’s and Kentucky Fried Chicken” (Barber, 1995, pp. 6–7; also see Fotopoulos, 1997, pp. 33–36).

The critical pedagogue Henry Giroux castigates the global neo-liberal discourse as “the most dangerous ideology of the current historical movement”, and explains:

It [neo-liberalism] assaults all things public, mystifies the basic contradiction between democratic values and market fundamentalism, and weakens any viable notion of political agency by offering no language capable of connecting private considerations to public issues ... Under the rule of neo-liberalism, politics are market driven and the claims of democratic citizenship are subordinated to market values ... The good life, in this discourse, ‘is constructed in terms of our identities as consumers – we are what we buy. The good life means living inside the world of corporate brands ... corporate culture rests on the dystopian notion of what he calls marketopia and is characterized by a massive violation of equity and justice (Giroux, 2002, pp. 428–430, underlining mine).

The weakening of the state and the concomitant erosion of the public sphere and of democratic citizenship, is having, as one would expect, negative effects on education. It should be noted here that, since the Enlightenment and the onset of modernity as well as the emergence of the nation state, public education has been considered to be an important ideological apparatus in the building of nations and in state formation (Green, 1990). In today’s global neo-liberal market-driven New Cosmopolis, in which possessive individualism and the private good supersede participatory citizenship, it appears that the wise counseling of the ancient sage Aristotle and the modern educational philosopher John Dewey about the inextricability of public education and democracy has been set aside, smothered or ‘sacrificed’ for the sake of ‘economic efficiency’, competitiveness, privatisation and the accumulation of wealth. Speaking generally about the effects of neo liberal globalization on public educational provision in ‘central’, that is, developed societies, Nelly Stromquist and Karen Monkman have observed:

[E]ducation is losing ground as a public good to become rather a marketable commodity. The state has become limited in its responsibility to schooling, often guaranteeing basic education but extracting in turn user fees from higher levels of public education, as any other service in the market ... The new outlook has made social policy secondary to the market and has ‘atomized the social’, centering on the interests of the individual as consumer rather than as citizen (Stromquist & Monkman, 2000, pp. 12–13, 15).

In more alarmist language, Nicholas Burbules and Carlos Torres have noted: “Public education today is at a crossroads ... in our view, nothing less is at stake today than the survival of the democratic form of governance and the role of public education in that enterprise” (Burbules & Torres, 2000, p. 23).

In 1995, Jean Elshtain, a distinguished political scientist, in her important book *Democracy on Trial* noted that in the United States the civic realm was characterised by cynicism, boredom, apathy, despair, violence, “exhaustion, opportunism, atomism, and ... a gradual loss of civil society”. She lamented whether democracy would prove sufficiently robust and resilient to survive. She counseled Americans to heed Aristotle’s words that the viability of a democratic polity and the democratic ethos presupposed an education or, more broadly, a *paideia* that, above all, aimed at political virtue (*arete*). In Elshtain’s own words, attention in America should be paid to “liberal learning and the cultivation of civic virtue” (Elshtain, 1995, p. 2). In the same wavelength, Benjamin Barber, has argued that public education and democracy are inextricably linked and that “public schooling and the public weal are intimately bound together”. Referring to the American tendency in education to emphasise instrumental rationality and vocational skills “to keep workers competitive in an economy increasingly dominated by what Robert Reich has called “symbolic analyst professionals”, Barber has argued that Americans needed to recall that education also had “a central civic mission”. And, like Elshtain, he has urged that “liberal arts education” must be taken more seriously in the United States, for “liberal arts education and civic education share a curriculum of critical reflection and autonomous thought” (Barber, 1997, p. 5). More recently, a collection of studies appropriately titled *Schools or Markets? Commercialism, Privatization, and School-Business Partnerships* (2005), documents the corrosive effects on the civic mission of public schools and democratic citizenship of the increasing involvement in public education of corporate America and the concomitant commercialisation of American schools and higher educational institutions (Boyles, 2005).

‘De-Professionalization’ and ‘De-skilling’ of the Teacher – from a Relatively Autonomous Professional Pedagogue to a Master Technocrat?

Paralleling the erosion of the public domain and the arresting of the ‘democratisation of democracy’, one observes a tendency towards the ‘de-professionalization’, or what is referred to as ‘de-skilling’ of the teacher. From a relatively autonomous ‘pedagogue’ and ‘public intellectual’, the teacher is developing into a ‘master technocrat’, whose job becomes one of how to organise and teach effectively, but uncritically, officially prescribed knowledge (curricula) and methods for high measurable achievement in examinations (Stromquist & Monkman, 2000, p. 13), and as Boyles would add “grading and preparation for future life-oriented curricula, i.e., pro-consumerism, job and workforce preparation, and skills-oriented approaches” (Boyles, 2005, pp. 220–221).

In countries like the United States, Canada and England, according to Hargreaves, the work of the teacher has been “intensified”, “formalized” and “technicized”. It “resembles more the work of a miserable manual laborer, and less that of an autonomous professional, whom we trust for the responsible exercise of authority and for straightforward judgment in the classroom, which he knows better than anyone else” (Hargreaves, 2003, p. 119; also see Apple, 1986). Essentially the same notion about the uncritical “technicization” and “bureaucratization” of teaching is implied by the Freirean-inspired critical pedagogue Donaldo Macedo in a provocative critique of the “instrumentalist” and “competency-based banking approach to literacy” – in its lower, that is, school, and higher, that is, university forms. According to Macedo:

For some, the instrumentalist approach to literacy may have the appeal of producing readers who are capable of meeting the demands of our ever more complex technological society. However, such an approach emphasizes the mechanical learning of reading of reading skills while sacrificing the critical analysis of the social and political order that generates the need of reading in the first place ... The instrumentalist approach has led to the development of ‘functional literates’ ... [it] also champions literacy as a vehicle for economic betterment, access to jobs, and increase in the productivity level. (Macedo, 1993, p. 189)

In another context, in a dialogue published in the *Harvard Educational Review*, Donaldo Macedo and the influential critical pedagogue Paulo Freire argue that the developing “objective” and uncritical “bureaucratized” teacher who “denies the oppressed the pedagogical space to develop a critical posture towards the world, particularly the world that has reduced them to a half-human object, exploited and dehumanised, is an educator who is complicit with the ideology of the oppressor” (Freire & Macedo, 1995, pp. 388–389).

And, as D. R. Boyles has pertinently claimed:

Schools [in the United States] are currently places where commercialism is rapidly intruding. Students, teachers, and leaders rarely critique commercial intrusion (resulting in uncritical consumers and uncritical citizens) ... Unfortunately, opportunities for questioning are limited as testing-, grading-, and preparation for future life-oriented curricula (i.e., pro-consumerism, job and workforce preparation, skills-oriented approaches) crowd out chances for such investigation. The concern here is that business partnerships inherently inhibit questioning and instead develop uncritical consumers rather than critically transitive citizens (Boyles, 2005, p. 220–221).

The ‘Sacrifice’ of Liberal Humanistic *Paideia*/Culture

The third significant ‘discontent’ of globalisation, about which there has been very little written or said, has been its effect on the ‘epistemic-cultural’ content of education,

especially on ‘liberal humanistic *paideia*/culture’, and more generally the ‘liberal educational tradition’. An illustration of this idea or ‘sacrifice’ is iconographically portrayed in a cartoon, which appeared in the English newspaper *The Times* (22 August 2000). The cartoon shows a young girl sitting on a sofa in front of a computer, and busily punching on the keyboard. By her side, there is a wastepaper basket with papers titled “history”, “religion”, and “theatre”. The caption below the picture reads: “History and Culture? Not Now!”

Permit me here to elaborate somewhat on this important historical development of the fortunes of “liberal humanistic *paideia*” from its construction in post-Enlightenment Europe and America – the nineteenth century – to today’s Brave New Cosmopolis of Globalisation and the Information/Technological Knowledge Society.

Phase I. Constructing the Classical Elitist and ‘Sexist Eurocentric Liberal Humanistic Canon/Liberal Humanistic Paideia in the Post-Enlightenment Europe and America

The classical concept of liberal humanistic *paideia* (LHP) or what has been called “The Liberal Humanistic Canon (LHC)”, first with classical studies as its core and later with a broader epistemic and cultural content, with a ‘non-practical’, ‘non-utilitarian’ and non-economic instrumentalist orientation, was constructed in the post-Enlightenment period – in the nineteenth century – and was promoted in the European and American secondary and higher education (in schools, colleges and universities). In England it was referred to as ‘liberal education’, in France as ‘*culture generale*’, in Germany as *Allgemeine Menschenbildung*, and in Greece as “classical humanistic *paideia*” (Kazamias, 1960, p. 264; Arnold, 1875, p. x; Halls, 1965, p. 2; McClean, 1995, p. 24; Sorkin, 1983, p. 63; Dimaras, 1973, pp. 60–67; Antoniou, 1987).

Turning to post-secondary education, the historical experience of ‘college education’ in the United States in the nineteenth century is especially noteworthy. A recent study by Caroline Winterer documents the central place that classical humanism (Greek and Roman) had in the curriculum of American colleges “from the founding of Harvard College in 1636 to the 1880s, when colleges across the nation began to drop their Greek and Latin requirements”. According to Winterer, “the schools and colleges were the nurseries of classicism until the late nineteenth century”, a classicism not defined narrowly but in the broader holistic sense of *paideia*, namely, “the process of realizing the full potential (intellectual and moral) in human nature through education”. It was believed that classical humanistic education in the broad meaning of *paideia* was fundamental in cultivating the minds and “in forming ethical human beings and upright citizens”. Further, it was believed that classical humanistic *paideia* would help combat the worst effects or “cancers” of “modernity”, such as “industrialization, materialism, civic decay, specialization, and anti-intellectualism” (Winterer, 2002, pp. 1–4).

As with the European secondary schools and the American colleges, the liberal humanistic canon of *paideia* (LHP) pervaded the idea of the modern European university, as developed in the post-Enlightenment epoch by the German neo-humanist Wilhelm von Humboldt and the English Cardinal John Henry Newman. In

Newman's idea of a university, the object of study was not "practical" or "useful", that is, utilitarian knowledge, but strictly "educational" and "intellectual". For Newman, the university was a site for "liberal education" and the cultivation of "cultured gentlemen" with "philosophic habits of mind" (Readings, 1996, pp. 65–75).

Humboldt's idea of liberal humanistic education was broader than Newman's. Key concepts in the Humboldtian idea of the German neo-humanist "University of Culture" were *Bildung* (the harmonious character development of man), *Wissenschaft* (scientific study), and *Kultur* (culture/national culture). *Bildung*, according to Gert Biesta "refers ... to the cultivation of the inner life, that is of the human soul, the human mind and the human person; or, to be more precise, the person's humanity". Furthermore, the same author has noted, "*Bildung* was more than only an educational ideal". It was also "and perhaps even primarily, an answer to the question about the role of the subject in the emerging civil society, viz., as a subject who can think for himself (not herself) and who is capable of making his own judgements ... In this respect the modern conception of *Bildung* has a political history as well" (Biesta, 2003, p. 62, underlining mine).

In both the German and the English idea of the modern university education, as conceptualised by Humboldt and Newman respectively, one discerns a clear preference for 'culture' and *episteme* ('science') – in German *Bildung und Wissenschaft* – as the university's defining mission and *raison d'être*. In both ideas, "intellectual culture", the quintessential element of a university education, emphasised the 'liberal philosophical' aspect rather than the 'mechanical' or 'useful'. And within this cultural-epistemological framework, in both cases, "national literary culture" gradually gained ascendancy (Readings, 1996, p. 75ff.).

Contesting the Hegemony of Liberal Humanistic Culture Paideia

With the advent of modernising developments such as industrialisation and democratisation, and the consequent political, economic, intellectual and sociocultural changes, the hegemony of the Eurocentric and elitist liberal humanistic *paideia*/culture, defined mainly in terms of the classical humanistic education, as the staple of the secondary school and university curriculum, began to be contested. At the same time, the concept of 'liberal education' was being re-examined and redefined. 'Modern' subjects, for example, modern languages, modern literature, history and the natural sciences, laid claim to liberal education and even 'humanistic' culture (Kazamias, 1960; also see Jordan & Weedon, 1994, p. 23ff.).

The questioning of the hegemony of the liberal humanistic canon, with classical education as its core, was also evident in France, Germany and the United States (for France, see Talbott, 1969, p. 14; for Germany, see Albisetti, 1987, pp. 182–183; and for the United States, see Tozer, Violas & Senese, 2002).

Phase II. What Knowledge Is of Most Worth in a Free and Democratic Society? A Modern Sequel

In Western Europe and America, the knowledge controversy and the associated conflict of studies, as well as the related concept of "liberal education" and the "liberally

educated person”, continued to be subjects of discussion and controversy at different historical junctures in the twentieth century. Such discourses have been especially manifest in the post-Second World War decades, and more recently, in the New Cosmopolis of late modernity, even postmodernity. The literature on this theme is vast and even a cursory examination of it is beyond the scope of this presentation. Here we shall merely highlight some key developments and discourses in the Anglo-Saxon world in the post-war period (the 1950s and 1960s), and the more recent period of globalisation and the information/technological knowledge society, that are relevant to our argument. First we shall highlight key discourses in the years following the Second World War.

In the United States, major universities grappled with the related questions: What should the intellectual and, more broadly, the educational experience of a college or university student consist of? What knowledge, intellectual/mental skills, and character traits should a college or university graduate possess in order to be called “an educated person and citizen in a free democratic society”? Harvard and Columbia Colleges/Universities and the University of Chicago, for example, but also other liberal arts colleges and universities, produced influential reports and books in which they developed an expanded concept of “liberal education”, which in America was viewed as being coextensive with “general education”. Specifically for our purposes here, both the famous Harvard Report, *General Education in a Free Society* (1947) and the Columbia Report, *Reforming of General Education* (1966) strongly recommended the preservation of general/liberal education as “the foundation of college education” (Bell, 1966, p. xix). According to the Harvard Report: “The task of modern democracy is to preserve the ancient ideal of liberal education and to extend it as far as possible to all the members of the community” (*General Education in a Free Society*, 1952, p. 53). During the same period, Robert Hutchins of the University of Chicago (UC), who had also placed the “liberal arts” – with a heavy emphasis in the humanities – as the core of the much publicised undergraduate curriculum of UC, decried what he had perceived as being a pragmatist “service-station” conception of the American university and its instrumental vocational orientation. In his many writings and speeches Hutchins advocated vigorously an education in the “liberal arts” as being “indispensable” and “unavoidable” for an “effective democracy” (Hutchins, 1936, 1952, 1953; Lyford, 1962/1986. For a more detailed analysis of the controversies about liberal education in the United States in the post-Second World War period, see Kimball, 1986).

In Britain, one hundred years after Spencer penned “What Knowledge Is of Most Worth?”, C.P. Snow, another Englishman – renowned scientist, novelist and public figure – gave the famous 1959 Rede lecture *The Two Cultures and the Scientific Revolution*. Like Spencer’s essay, Snow’s lecture sparked widespread and heated debate that, according to a recent critic, “is still raging in the media today” (van Dijck, 2002). C.P. Snow’s provocative thesis was stated unequivocally as follows:

I believe the intellectual life of the whole of western society is increasingly being split into two groups ... literary intellectuals at one pole – at the other scientists. ... Between the two a gulf of mutual incomprehension – sometimes (particularly among the young) hostility and dislike, but most of all lack of understanding.

... This polarization is sheer loss to us all. To us as people, and to our society.
(Snow, 1959, p. 2ff.)

From the perspective of this study, the American and the English discourses in the post-Second World War period illustrate the changing conceptions of what types of knowledge and culture constituted “liberal or general education” and concomitantly an educated citizen should possess in an advanced capitalist democratic society where science and technology were considered to be basic desiderata for progress and economic development. They also show that in the twentieth century, the nineteenth-century concept of LHP with a “classical humanistic curriculum” as its core, was no longer dominant in education, although an expanded concept of humanistic education that, in addition to the classics (particularly Latin) included history and literature, was emphasised in the British secondary Grammar and Public schools, and was still considered to be “high status knowledge” in the British universities and in some American Liberal Arts Colleges (for Britain, see McLean, 1990, p. 26). In the United States the “humanistic curriculum” in the secondary schools all but disappeared. The “struggle for the American curriculum”, as Herbert Kliebard has shown, was won over by the “social efficiency” advocates (Kliebard, 1995).

From the review of the discourses above, the comparative historian can draw certain inferences that are germane to this study. First, it is clear that by mid-twentieth century (the 1950s and 1960s), at least in the Anglo-Saxon world, “liberal or ‘general’ education/culture” was being re-conceptualised, and its *epistemic* space or content expanded. No longer could one say that “humanistic *paideia/culture*”, either in the classical meaning (cf. Winterer’s “culture of classicism”, in Winterer, 2002), or indeed in the modern broader sense of “education in the humanities”, held a pre-eminent position in the “liberal or general education” of citizens in a free democratic society. The classics – Latin and Greek – all but disappeared in the United States, while the “humanities” in traditionally “humanist Europe”, were “demoted” at best to an equal status with the natural sciences and “social studies”. At worst, humanistic *paideia/culture* was devalued in terms of its “usefulness” and instrumental worth in the developing post-industrial and increasingly techno-scientific world, compared to the ascendant “sciences”. Even in traditionally “humanist” England, where the humanistic liberal arts – the Trivium – “dominated the university” as Basil Bernstein had later noted, “what we are seeing is the growing development of the specialized disciplines (science and mathematics) of the Quadrivium” (Bernstein, 1996). A second inference is that despite its broader “two- or three-culture” epistemic content and orientation, “liberal/general education” continued to be elitist and basically Eurocentric.

Contesting the ‘Modern Sequel’, and the ‘Crisis’ in the Humanities

The conflict of studies and cultures and the related discourse about the epistemic content of liberal education, indeed the place of liberal education/culture in schools, colleges and universities, and the ancillary question of the place of “humanistic education/*paideia*”, continued to characterise the knowledge and pedagogical controversies, with varying degrees of intensity, in the ensuing decades of the twentieth century.

In the 1960s, the “Students for a Democratic Society” questioned the value of humanistic studies in American education. They considered such studies as being “elitist” and tied to the past, and not relevant for the burning questions of the present. These students were calling for “knowledge relevance” (Rasis, 1988, pp. 135–136). At the same time, however, Mario Savio, the leader of the student protest at Berkeley in 1964, criticised the developing idea of the University as a “knowledge factory” that emphasised “socially and economically useful knowledge” and privileged “the scientific and technical disciplines” at the expense of the “human sciences”, particularly the “humanities”. It should be noted here that Savio’s protest occurred one year after Clark Kerr, the President of Berkeley, first published his influential book *The Uses of the University* where he had “posited the production of useful knowledge as the core of the university’s mission (Kerr, 1963; Aronowitz, 2000, pp. 30–35). Also, in the ensuing years, the “two- and three- culture” conception of liberal/general education was criticised by “multi-culturalists” as being elitist and Eurocentric (see Dijeck, 2002).

The value of humanistic studies and their role in contemporary society as well as their future, were also a subject of wider discussion and concern. Humanist scholars were already talking about a developing “crisis” in this area, which they deplored, a crisis that became more acute in the last quarter of the twentieth century. Calling the tradition of the humanities “education’s great amnesia”, Robert Procter, an American scholar, in a well-documented historical study has written that “[t]he humanities have had a strangely cyclical history: they degenerated in the late Renaissance, came back to life in the early eighteenth century, and have degenerated again in our own time” (Procter, 1988/1998, pp. ix, 87). And, according to Graham Good, a Canadian scholar, in the contemporary “inclusive university”, humanism has been “betrayed”; the liberal humanist ideal is being eroded (Good, 2001, p. 103; also see Schein, 2001, p. 213).

Phase III. What Knowledge Is of Most Worth in the Brave New Cosmopolis of Globalisation and the Information/Technological Knowledge Society – a Post-Modern Sequel?

In North America – the United States and Canada – the decline of “classical liberal humanism” (CLH), and the concomitant dethronement of Liberal Humanistic *Paideia*/Culture (LHP) from its privileged position in education have been attributed to a concatenation of factors. As higher education was being further expanded and democratised, CLH and LHP were criticised for being elitist, racist, male-dominated/patriarchal, culturally restrictive and Eurocentric. At the same time, as noted above, liberal humanistic knowledge was seen as being “non-relevant” and non-practical in the capitalist world of late modernity. Equally important, the deteriorating fortunes, nay what we have here metaphorically referred to as the “sacrifice” of CLH and LHP, must also be sought in the changing Idea of the University, its mission and its role in the unfolding Brave New Cosmopolis of Globalisation and the Knowledge Society. Speaking about higher education in North America, Graham Good has attributed the “betrayal of humanism” to the “politicization and commercialization of the university”:

The university no longer adheres to the central defining purpose of its liberal humanist phase – the disinterested pursuit and preservation of knowledge.

Instead it caters to, and tries to reconcile, a plurality of interests: individuals want marketable skills, employers want suitably trained employees, and political and economic forces want their agendas and preferences represented. In the absence of a common end, the university can only be governed by bureaucratic rationality. ... Thus, the university can be simultaneously commercialized (by the quest for corporate sponsorship for professorships, buildings, and research programs) and politicized (by the new sectarianism and its group politics, equity officers, and pressure groups). (Good, 2001, pp. 103–104)

Related to the above, the American university, in the second half of the twentieth century, was being transformed into what Robert Hutchins, earlier in the century, had called “a service station” educational establishment that over-emphasised the “empirical sciences”, and instrumental knowledge with a vocational orientation, at the expense of the classics and the liberal arts (see Hutchins, above). A similar Idea of the University, that emphasised the production of “socially and economically useful new knowledge”, as mentioned earlier, was propounded by Clark Kerr, the President of the University of California at Berkeley. “New knowledge”, according to Kerr, was virtually identical with scientific and technical knowledge. In Kerr’s *New Idea of the University*, the humanities were accorded a secondary place (Kerr, 1963; Aronowitz, 2000, pp. 32–34).

In one of the most severe critical analyses of the nature, the structure, the curriculum and the intellectual orientation of the changing university and college education in the United States the critical sociologist Stanley Aronowitz has boldly claimed: “With only a few partial exceptions, there is little that would qualify as higher learning in the United States. ... By ‘higher learning’ I mean places where students are broadly and critically exposed to the legacy of Western intellectual culture and to those of the Southern Hemisphere and the East” (Aronowitz, 2000, pp. xvii–xviii). Some of the key ideas in this indictment of American higher education, that are relevant for us in this presentation, may be summarised as follows:

- Vocationalisation of public colleges at the expense of liberal arts and sciences, as shown by the growth of “enrollments in business, accounting, education, engineering, and other technical areas, including media technology at the expense of the arts and sciences” (Aronowitz, 2000, pp. 55–56).
- Privileging of “instrumental reason/rationality” and “training in undergraduate “core curricula” of general education: for example, according to Aronowitz, “Harvard’s twenty-year old educational reform is, at the bottom, profoundly ensconced in instrumental reason” (Aronowitz, 2000, p. 139).
- Related to the above, Aronowitz criticised “the academic system of American society” for being “geared to practical ends”, namely, “the production of useful knowledge” and “supplying the vast but segmented market for intellectual labor”, instead of “being the home of scholars engaged in the disinterested pursuit of truth” (Aronowitz, 2000, p. 38).
- Dismantling the American “corporate university”, and a “new vision for true learning”: for the reasons adumbrated above, Aronowitz argues that the American “corporate university” should be “dismantled”. Instead, in “an era of globalisation and rapid technological change”, he offers “a vision for true

learning that places a well-rounded education back at the center of the university mission". He elaborates:

The fundamental mission of higher education should be to play a leading role, perhaps the leading role, in the development of general culture. ... Colleges and universities] must be centers of learning, but also sites of discovery, not only in the natural sciences but also in the natural sciences and the humanities. (Aronowitz, 2000, p. 172.)

Similar observations and critiques, as the above, have been made about contemporary university education in the West. In his book *The University in Ruins* (1996), Bill Readings claims that the University "no longer participates in the historical project for humanity that was the legacy of the Enlightenment: the historical project of culture" (Readings, 1996, pp. 5, 74–75). In today's world of economic globalisation, the rise of transnational corporations (TNCs) and the concomitant "decline of the nation-state", the university", Readings argues, "is a "ruined institution", for it "has been stripped of its cultural mission". It has been forced to abandon its historical cultural mission. Instead, it has become "a bureaucratic arm of the unipolar capitalist system" and "ensconced in consumer ideology. ... It is no longer called upon to train a citizen subject" (pp. 14, 44–48).

The "instrumentalist pressure on knowledge production" in the contemporary university, and the corrosive effects on liberal culture, the arts and "the life of the mind" by the "instrumentalist ethos of the market", and by "pragmatic" and "philistine" concerns, are discussed in another pungent critique of contemporary cultural institutions, including the universities of Europe and North America. In a controversial volume entitled *Where Have All Intellectuals Gone? Confronting 21st Century Philistinism* (2004), the English sociologist F. Furedi claims that "the philistine ethos ... informs much of educational and cultural policy", where the term "philistine" is defined as "a person deficient in liberal culture; one whose interests are material and commonplace" (Furedi, 2004, pp. 1, 3). He characterises university life as "banal", while real scholarship, namely, "the pursuit of excellence and truth, is frequently represented as a bizarre, self-indulgent and irrelevant pursuit" (p. 2).

Furedi criticises the conformism and passivity of today's critical intellectuals. He urges that intellectuals should "reconstitute themselves through reclaiming the autonomy for which their predecessors fought in previous years". And he concludes his critical diatribe with the following thought:

There is very little we can do to force the elites to give up the instrumentalist and philistine world view. But we can wage a battle of ideas for the hearts and minds of the public. How we can do it is one of the key questions of our time. (Furedi, 2004, p. 156)

Essentially the same idea about the corrosive effects of Globalisation on Liberal Humanistic *Paideia*/Culture is implied in judgmental statements made by others. For example: (a) Stephen Ball has argued that "problems of globalization frame and

produce the contemporary problems of education” and “new orthodoxies”, one of which, according to him, is “the increasing colonization of education policy by economic policy imperatives” (Ball, 1998); (b) John Field has commented that the “EU’s action programmes are relentlessly vocational, utilitarian and instrumental in their emphasis”, a “technological option” that has created a tension between “instrumentalism” and the European “attachment to the humanistic tradition of education” (Field, 1998, p. 8); (c) referring to “schooling and the free market” in the United States and the United Kingdom, Spring has exclaimed in obvious despair: “The bean counters are taking over! Accountants and economists are replacing Confucius, Buddha, Plato, John Newman, Robert Hutchins and the many others who have discussed the meaning of a good education and the good life” (Spring, 1998, p. 149); and (d) according to Robert Cowen: “The contemporary crisis – globalization and the relative increase in powerlessness of the ‘nation-State’ – is not merely an economic crisis. It is a cultural one, which requires historical, sociological, anthropological, cultural and philosophical analysis. If the social and human sciences are impoverished by technicization – by performativity, by pragmatism, by an excessive concern for the immediate and the useful – then one of the defences of nations to understand what is happening to them will be dramatically weakened” (Cowen, 1999).

Finally, it would be relevant here to note that the drive towards instrumental and “techno-scientific” forms of knowledge can be interpreted as a contributing factor to a “shift in values and social ethic”, whereby, according to Neave, education is “increasingly viewed as a sub-sector of economic policy”, and less as “part of social policy” (Neave, 1988, p. 274).

The Sacrifice of Liberal Humanistic *Paideia*/Culture: An *Epimythion*

In Euripides’ play *Iphigenia at Aulis*, when Agamemnon’s daughter Iphigenia is brought to the altar to be sacrificed, she is snatched by the goddess Artemis and taken to join the gods as a high priestess. Agamemnon is elated and hastens to comfort his distraught wife Clytemnestra that they should feel happy because their daughter is alive among the company of the gods. He then bids her farewell telling her that he looks forward to seeing her again when he returns from Troy. Clytemnestra, however, remains ominously silent. And the curtain falls after these rather sibylline stanzas by the chorus:

Farewell, son of Atreus, I wish you good voyage to Phrygia
and a good return, bringing with you sumptuous/beautiful spoils from Troy!

Of course, the Athenian audience knew the myth and what these words portended: triumph and spoils, but also tragic consequences. Agamemnon’s pillaging of Troy, and his triumphant return to Argos “bringing with him sumptuous spoils”, as the Chorus enigmatically had prophesied, were accomplished at heavy “human” cost: the sacrifice of his own “flesh and blood”, the raping and enslavement of the Trojan women, the slaughter of the finest Greek and Trojan youth, and the killing of innocent people. And after Troy:

the butchering of Agamemnon himself by his wife Clytemnestra, who never forgave him for the *hubris* he had committed, Clytemnestra's murder by her own son Orestes for the *hubris* his mother had committed, and, in turn, the vengeful pursuit of Orestes by the bloodthirsty Furies for his equally condemnable act, the *hubris* of matricide.

As in the Agamemnon myth, in the first episode above, we have argued that discursive statements and practices in education (*logos* and *praxis*) that are constructed and legitimised in response to and through the prism and the imperatives of the globalisation of capitalist "market fundamentalism" and the associated Knowledge/Learning Society may indeed bring wealth, blessings and "beautiful Trojan spoils". But, as the myth of Agamemnon presaged, they will also exact a heavy "human" price and necessitate "humanistic sacrifices", namely, violence, competitiveness, possessive individualism, the "economic colonization of people" (Korten, 1995, p. 245), the loss of social justice and other democratic civic virtues, and most pertinently for our purposes here, liberal humanistic culture and anthropocentric pedagogies, what we have called "*Paideia* of the Soul", with ultimate dire consequences.

Now, if (a) being human creatures quintessentially signifies having minds as well as souls, (b) the imagined "Brave New Cosmopolis of Globalisation and the Information-Technological Knowledge/Learning Society", as presented in the first episode of this duology, can be said to be not "wholly human", (c) the role of education is, among other things, the cultivation of minds and souls, and what Martha Nussbaum has called "humanity" (Nussbaum, 1997), and (d) one agrees with Sophocles' paeon to man, namely, that "he is the greatest wonder on earth" and "for every ill he hath found a remedy" (chorus in *Antigone*), or, in the same vein, with Shakespeare's Hamlet, namely, "What a piece of work is man! How noble in reason! How infinite in faculty! In apprehension how like a God!" (Hamlet in *Hamlet*), then, one may legitimately pose the question: What can the contemporary human (the politician, the intellectual, the scientist, the artist, the educator, the pedagogue, the citizen) do "to arrest" the "dehumanizing" tide of economic globalisation and "market fundamentalism"?

In the second episode, I try to answer this question by using another ancient Greek myth, the Myth of Prometheus as dramatised by Aeschylus in *Prometheus Bound*.

Episode Two – Prometheus Unbound: Promethean Neo-Humanism in the Brave New Cosmopolis of Globalisation and the Information/Technological Knowledge Society

Prologue – The Myth of Prometheus

In Aeschylus' *Prometheus Bound*, Prometheus the Titan, son of Earth, creator and friend of "mortal man" as a superior being blessed with a "higher soul" than an animal, and with the ability "to reason"; Prometheus the "foreteller", germ of intelligence and moral order in a brute, chaotic and violent universe, had sided with Zeus in his overthrow of Cronos, the Olympian lord of the gods, and with Zeus' subsequent succession as the undisputed master of the universe. But when Zeus, the

dynastic Olympian planetarch (ruler of the planet), wanted to destroy the “miserable race of men” and replace it by another – by a race of fettered and servile “sub-human” creatures – over whom he would rule with brute force, Prometheus the philanthropos (lover of mankind) stole Fire, the source of all civilisation, wisdom and all human arts from heaven, and bestowed it as a gift to humanity. Fearing that this act of philanthropy would increase the power, the confidence and the wisdom of mortals, Zeus condemned Prometheus to be nailed by the mighty fire-god Hyphaestus (Vulcan) to a rock in the Caucasus, where an eagle continually preyed on his liver. Sympathisers with Prometheus visited him and urged him to accept the sovereignty of Zeus – the new master of Olympus – to cease acting as the champion of freedom, justice and the human race, and to recant. But despite his agonising ordeal, Prometheus did not compromise; he continued his defiance of Zeus’ tyrannical power, until in the end Zeus released him (Aeschylus, *Prometheus Bound*).

In Aeschylus’ drama, Prometheus symbolises the rebellious and creative human being who possesses an acute mind and, as a benefactor of humanity, the will to rebel against absolute sovereignty, tyrannical power and violence and the dehumanising enslavement of mortals. As the foreteller, he could foresee that the almighty hegemon Zeus would create “humanoid” rather than “human creatures” devoid of human “minds and souls”.

Prometheus Unbound: Promethean Neo-Humanism and Paideia

In the second episode of this duology, globalization, through stakeholders like the Transnational Corporations (TNCs), is presented as an imperial “knowledge power”. Like the newly enthroned planetarch Zeus in *Prometheus Bound*, globalization is bent on constructing not wholly human creatures, what otherwise could be referred to as cyborg citizens (Mann, 2001), without the quintessential human minds, feelings and “souls”, as symbolically represented in a brilliant advertisement of Johnny Walker whiskey. The videoed advertisement shows a talking anthropoid (with a human façade, a mechanical neck and backside head), which in successive dramatic scenes emits audibly the following thoughts and sentiments:

- I am faster than you; I am stronger; certainly I will last much longer than you.
- You may think I am the future, but you are wrong.
- You are.
- If I had a wish, I wish to be human: to know how it feels, to feel, to hope, to despair, to wonder, to love.
- I can achieve immortality by not wearing out.
- You can achieve immortality.
- Simply by doing one great thing – keep walking!

To recollect Plato’s famous allegory of the Cave, in a Cyborg Cosmopolis the human being is placed in a modern “virtual cave”, a site of “non-*paideia*”, where he/she is held captive of a “virtual reality” devoid of human qualities, dispositions and aesthetic skills. Such an imagined Brave New Cosmopolis may indeed be a rational techno-scientific and an economically hegemonic Cosmopolis. But, we have argued, it will be a Dehumanised Knowledge Dystopia (DKD) – a Post-Human Empire (PHE)?

What Is to Be Done?

In the second episode, Prometheus Unbound, we argue that what could be done to “cultivate humanity” (Nussbaum) in the “dehumanizing” Knowledge/Learning Cosmopolis, the Post-Human Empire, or to use Furedi’s terminology, the Philistine Empire (Furedi, 2004), is to re-conceptualise/re-imagine/reinvent and promote Liberal Humanistic *Paideia*, by which we mean an education that refers to and cultivates human attributes and qualities, namely, the mind, the virtues, the passions, the feelings (in the words of the anthropoid above, “to know how it feels, to hope, to despair, to wonder, to love”), the problems, man’s and woman’s human condition. Such an intellectual, epistemological and pedagogical project would entail the creation of “humanist learning societies” or in O’Sullivan’s terminology, “human communities” (O’ Sullivan, 2001), through the promotion of a humanist *Paideia* and Pedagogy, with a re-conceptualised and reconstituted humanistic learning occupying a prominent place in the curriculum of schools, colleges and universities.

By re-conceptualising Liberal Humanistic *Paideia* we do not mean reviving the narrow concept of classical humanistic *Paideia* that was centred in the classical literary and philological disciplines (see Jaeger, 1939; Papathanasopoulou, 1987). Nor do we mean exclusively the *Trivium* – Grammar, Rhetoric and Logic – plus Music, of the *Septem Artes Liberales* (The Seven Liberal Arts) of the Medieval University (Kimball, 1995). We argue for the reinvention of a Promethean neo-Humanism in education, that questions the hegemony of the Information/ Technological Epistemological Paradigm (Castells) and rejects all constraints on the humanness, the free spirit and the imagination of man, by cultivating “all the human arts”, especially the broad epistemic space of the Arts and the Humanities. We would argue for a Humanistic *Paideia* and Pedagogy, based on the broad spectrum of what has come to be known as Liberal Arts (the *artes humanitatis/studia humanitates*), and among them, the broad concept of humanistic education, that includes Language, Literature, Poetry, Drama, Philosophy, History, Music and the Arts (see Procter, 1988/1998). Contrary to possible criticisms that such an education would be conservative and not devoid of Eurocentric elitist, sexist, racist, and “classist” elements, our re-conceptualised *Paideia* and Pedagogy could indeed be “empowering”, “emancipatory”, “transformative” and, above all, humanising to all, including the poor, the oppressed and the underprivileged. In support of this idea, it would be relevant here to refer to the much-acclaimed Clemente Course in the Humanities (CCH), as expounded in Earl Shorris’ book *Riches for the Poor* (2000). The CCH started on an experimental basis in the Lower East Side of New York and then it expanded to 17 sites in the United States, Canada and Mexico. Its aims, according to Shorris, were: “through the humanities to enable poor people to make the journey into the public world, the political life as Pericles defined it, beginning with the family, and going on to neighborhood, community and state”. By the “political life as Pericles defined it” Shorris meant *vita activa* – active, reflective citizenship – and, we might add, what Aristotle meant by “man” being a “political animal” (*zoon politikon*), as exemplified by Socrates, the “philosopher citizen”. (Shorris, 2000, pp. 4–10). As to the aforementioned possible criticisms of humanistic education, Shorris’ comments about the study of the humanities would be quite in order here:

To call for the study of the humanities now as an answer to the problem of poverty in the United States contravenes the views of both the left and the right. The left abandoned the study of the humanities as the cultural imperialism of dead white European males, giving it over to the conservatives, who have claimed it as their own. In fact, the humanities should belong to the left, for the study of the humanities by large numbers of people, especially the poor, is in itself a redistribution of the wealth. The right, on the other hand, has had no use for the living humanities since Plato banned poets from *The Republic*. (Shorris, 2000, p. 105)

Epistemic areas such as the arts and the humanities represent different forms of knowledge from techno-scientific studies and empirical social sciences, which, more than ever, are needed in the dehumanising Brave New Cosmopolis of Globalisation and the Knowledge/Learning Society. In an enlightening essay on “Aesthetic Modes of Knowing”, Elliot Eisner has argued that areas such as Literature, Music and Art represent “aesthetic forms of knowledge” that is different from the most widely accepted “scientific knowledge”. Viewed this way, “both artist and scientist create forms through which the world is viewed ... both make qualitative judgments about the fit, the coherence, the economy, ‘the rightness’ of the forms they create”. And in support of the “aesthetic mode of knowing”, Eisner avers:

The aesthetic is not only motivated by our need for stimulation; it is also motivated by our own need to give order to our world. To form is to confer order. To confer aesthetic order upon our world is to make that world hang together, to fit, to feel right, to put things in balance, to create harmony. ... The aesthetic, then, is motivated by our need to lead a stimulating life ... the aesthetic is also inherent in our need to make sense of experience. (Eisner, 1985, pp. 26–30)

In the same vein, the epistemological, the liberatory-humanistic and the aesthetic value of the Arts, particularly “during this period of global change”, was unequivocally declared by the editors of the *Harvard Educational Review* (HER) in a published symposium on “Arts As Education” in 1991. The editors averred that “learning in the arts is fundamental to education because the arts are an essential aspect of human knowing and being in the world”, and “educational reform and debate without the arts is incomplete reform”. Their reasoning behind this claim is worthy of quotation in full:

We perceive the arts to be a fundamental way of knowing, or, as first-grade teacher Karen Gallas puts it in her essay’s title: Arts as Epistemology. The arts can be, for both students and teachers, forms of expression, communication, creativity, imagination, observation, perception, and thought. They are integral to the development of cognitive skills such as listening, thinking, problem-solving, matching form to function, and decision making. They inspire discipline and dedication. The arts can also open pathways toward understanding the richness of peoples and cultures that inhabit our world, particularly during this period of global change. The arts can nurture a sense of belonging, or of community; they can foster a sense of being apart, or of being an individual. The arts give rise to many voices. By acknowledging the role of the arts in our lives and in education,

we acknowledge what makes individuals whole. (*Harvard Educational Review*, 1991, p. 25)

The epistemological, ethical, aesthetic and *a fortiori* humanising potential for the study and teaching of Literature – poetry, drama, novel, biography, essay – in a democratic society, especially in the contemporary turbulent, uncertain, insecure and problematic world, has been presented eloquently by Louise Rosenblatt in her classic and influential *Literature as Exploration* (1938/1965/1968/1976/1995). Echoing Henry James, the province of literature, according to Rosenblatt, is the human experience, “everything that human beings have thought or felt or created”. And she explains: “The lyric poet utters all that the human heart can feel. ... The novelist displays the intricate web of human relationships with their hidden patterns of motive and emotion. ... The dramatist builds a dynamic structure out of the tensions and conflicts of intermingled human lives” (Rosenblatt, 1995, pp. 5–6).

Promethean neo-Humanism through the Arts and the Humanities has the potential not only of developing cognitive skills and “forming minds”, which are necessary qualities of being human. As conceptualized here, more than the “sciences”, it also has the potential of cultivating the “human soul” – the social, ethical, emotional and aesthetic attitudes, the skills, dispositions and virtues, and the character traits that are quintessentially human (also see Cohen, 2006, and O’ Sullivan, 2001). In the opening essay in the aforementioned HER symposium (1991) on “Arts As Education”. Maxine Greene, the distinguished American philosopher of Education, argued that *imagination*, which is “at the core of understanding” and responsible for “the very texture of experience”, and the *emotions*, including taste and sensibility, “can be and ought to be, educated ... through initiation into the artistic-aesthetic domains” (p. 31), by which she meant the Arts, namely, the spectrum that includes Dance, Music, Painting and the other graphic arts, Literature and Poetry. The arts, according to her, “offer opportunities for perspective, for perceiving alternative ways of transcending and of being in the world, for refusing the automatism that overwhelms choice” (p. 32). And speaking about the “transformative” pedagogical potential of the arts, Greene asserts that “one of the functions of the arts is not only to make us see (as Joseph Conrad wrote) ‘according to our deserts’ ... not only to change our everyday lives in some fashion, but to subvert our thoughtlessness and complacencies even about art itself” (p. 33). And again: “At the heart of what I am asking for in the domains of art teaching and aesthetic education is a sense of agency, even of power. Cockburn’s notion of the power of folk music ‘as a means of individual expression and a tool for social change’ suggests possibilities in the main domain of the arts. Painting, literature, theatre, film; all can open doors and move persons to transform” (p. 38, underlining mine).

An illustrative example of an Art that represents a different form of knowledge from the “sciences”, and has the twofold potential of developing the “mind” and “cultivating the soul” is that of Music. In a recent study titled “The Neglected Muse: Why Music is an Essential Liberal Art,” Peter Kalkavage, a musician and a teacher of music, argues that Music “is the union of the rational and irrational, of order and feeling. ... Even apart from its profound connection with mathematics, music is pre-eminent among

the arts for the order and clarity, the sharply defined character, of its elements.” Music, he further explains, “is an essential part of who we are as human beings ... ultimately, by shaping feeling, music shapes the whole human being”. And in bolstering his argument about the educational value of Music, Kalkavage refers to the Greek philosopher Aristotle, for whom Music, as an ingredient of *Paideia* was crucially useful for the intellectual, moral and political development of the virtuous *anthropos-politis* (citizen-person) (Kalkavage, 2006, p. 16).

Another example of the difference between the approach of the “social sciences” and that of the Arts is provided by Literature. According to Rosenblatt:

In contrast to the analytic approach of the social sciences, the literary experience has immediacy and emotional persuasion. Will President Madison or Rip Van Winkle live more vividly for the student? Will the history of the Great Depression impress him as much as Steinbeck’s *The Grapes of Wrath*? Will the theoretical definitions of the psychology textbook be as illuminating as *Oedipus* or *Sons and Lovers*? Obviously, the analytic approach needs no defense. But may not literary materials contribute powerfully to the student’s images of the world, himself, and the human condition? (Rosenblatt, 1995, p. 7)

Epilogue/Epimythion – Tending to the ‘Mind’ and the ‘Soul’

In his defense/apology at the trial at which he was indicted and condemned to drink the hemlock for his alleged “impiety”, specifically for preaching “new demons/ ideas”, different from those of the State, and for “corrupting the youth”, Socrates the “humanist philosopher-citizen” of democratic Athens, like the mythical humanist Prometheus, refused to obey the dictates of those in power and give up philosophy, which he considered to be a *sine qua non* for the cultivation of the “minds” and “souls” of the democratic *anthropoi-polites* (citizens-persons). In his defiance at the trial, he reiterated that he would prefer to die rather than cease to say to whomever he met: “How can you, my friend, an Athenian citizen of the greatest, wisest, most glorious and most powerful city, not be ashamed for caring more about how you acquire honor, glory and riches, and not be interested in your intellectual development, in truth and in tending to your soul?” (Plato, *Apology*).

Our re-conceptualised humanist *Paideia*/Pedagogy for the creation of democratic citizens with “minds and souls” in the Knowledge/Learning Cosmopolis of the twenty-first century may be epitomized in terms of the following key ideas and human values: Character, Community, Inclusiveness, Integrity, Cosmopolitan Identity, Sympathy, Caring and Democracy (Hargreaves, 2003; Nussbaum, 1997, Noddings, 1984), but also Justice, Wisdom, Responsibility, Friendship, and Critical Thinking.

BEYOND METHODOLOGICAL ‘ISMS’ IN COMPARATIVE EDUCATION IN AN ERA OF GLOBALISATION

Roger Dale and Susan Robertson

Introduction

[A] whole series of key concepts for the understanding of society derive their power from appearing to be just what they always were and derive their instrumentality from taking on quite different forms. (Smith, 2006, p. 628)

Gavin Smith's pithy insight takes us straight to the heart of the methodological – but also the substantive – problems posed to comparative education by ‘globalisation’. We do not need to define globalisation very precisely to recognise that it has brought about major challenges to comparative education's objects of study, and the terms and concepts it uses – and this means, we will argue, that it has also brought about changes in the meaning of comparative education itself. In this chapter we will be suggesting that recognising the nature and extent of this problem is one of the most important requirements of being comparative in education in an era of globalisation, for a major consequence of globalisation, not just for comparative education but more generally, is that while it has profound effects on the key features of the economic political and social worlds we inhabit, we remain tied to the concepts with which we described and understood the world prior to globalisation.

We will focus here on both the changes brought about by globalisation in the core objects of study of comparative education, ‘*national*’ ‘*education*’ ‘*systems*’ and their consequences for the area of study, both methodological and ‘political’. In terms of the first, we will suggest that the three central elements of the field of comparative education, respectively directly related to those three core objects of study, are in danger of becoming somewhat ossified and of thereby restricting, or even obstructing, rather than expanding, our opportunities to come to terms with globalisation and the ways in which institutional and everyday life has been transformed.

We will suggest that the danger can be summed up by suggesting that the ways of approaching the central elements of comparative studies of education, national systems, state-run, of education, are in severe danger of becoming ‘isms’. We may be confronted by, or reliant on, not just methodological *nationalism*, but methodological *statism* and methodological *educationism*. In each case the ‘ism’ is used to suggest

an approach to the objects that takes them as unproblematic and assumes a constant and shared meaning; they become ‘fixed, abstract and absolute’ (Fine, 2003, p. 465), and the source of the danger lies in the nominal continuity provided by the ostensibly ‘same’ concepts, as Smith warns. The assumption/acceptance of the ‘isms’ means that the understanding of changes brought about by globalisation may be refracted through the lenses of unproblematic conceptions of nationalism, statism and educationism, even as these changes themselves bring about changes in the meaning of, or the work done by, nation states and education systems, and thereby undermine their validity. One reflection of the depth of the embeddedness of this set of concepts is that they become themselves a kind of benchmark against which perceived changes are measured and represented; thus we have the ‘De-’conceptions; de-territorialisation, de-statisation, de-concentration, decentralisation and so on (Patramanis, 2002).

It is our argument that it has taken the impact of globalisation to expose the problems of the ‘isms’ in comparative education (and indeed education studies more widely). It is fundamentally the changes of the scale and the means of governance at and through which ‘education’ is carried out that have exposed the shortcomings of previous theorising. What seeing the core elements of comparative education as methodological ‘isms’ reveals is that it has rarely ever been the case that ‘the state did it all’ in the case of education, that educational activities and governance have ever been confined to the national scale and that ‘education’ has ever been a single straightforward, unproblematic conception.

Comparative Education and ‘National Education Systems’

Methodological Nationalism

The most widely recognised of the ‘isms’ is methodological nationalism. The nation state has been at the core of comparative education throughout its history. It has been the basis of comparison, what has been compared. As Daniel Chernilo puts it, “the nation-state became the organizing principle around which the whole project of modernity cohered” (Chernilo, 2006, p. 129). We might see it as the institution that embodies the principles of modernity and through which those principles are to be delivered. Furthermore, the nation-state conception is further reinforced by its being embedded within a well-established system of similar states, (where nation states are recognised as legal entities under international law) which deepens the difficulty of both looking beyond, and of imagining alternatives to it.

The nation state has been the core concept on which the methodological nationalism that has characterised not just comparative education, but most of social science, has been based (Martins, 1974). In fact, we can identify four distinct elements of this problem (for an extended critique of the conception of methodological nationalism in comparative education see Dale, 2005). The first, and best known, is the idea that methodological nationalism sees the nation state as the container of ‘society’, so that comparing societies entails comparing nation states (Beck, 2002; Beck & Sznaider, 2006). The second is the close association between nation states and comparison brought about by the ‘national’ being the level at which statistics have traditionally

been gathered; as one of us put it elsewhere, methodological nationalism operates both about and for the nation state, to the point where the only reality we are able to comprehensively describe statistically is a national, or at best an international, one (Dale, 2005, p. 126). The third element of the problem arises from the tendency to juxtapose an unreconstructed methodological nationalism to underspecified conceptions of 'globalisation' in a zero-sum relationship. This typically takes the form of the global 'affecting' the national, or the national 'mediating' the global. This is not to say that such relationships are not present, but that they are not to be taken as the norm. The final element we wish to mention here concerns the extent of the suffusion, or identification, of concepts of the nation state with a particular imaginary of rule. This has become clearer through recent discussions of conceptions of 'sovereignty', 'territoriality' and 'authority' (cf. Ansell & Di Palma, 2004). These discussions essentially see the particular combination of responsibilities and activities that nation states have been assumed to be responsible for as historically contingent rather than functionally necessary, or even optimal. Thus, though the ontology that "a region of physical space ... can be conceived of as a corporate personality", the nature, implications and consequences of this have varied greatly, and it remains the case that "the unity of this public authority has generally been regarded as the hallmark of the so-called Westphalian states" (Ansell, 2004, p. 6), while "the chief characteristic of the modern system of territorial rule is the consolidation of all parcellised and personalised authority into one public realm" (Ruggie, 1993, p. 151). However, while "public authority has been demarcated by discrete boundaries of national territory ... so, too, has the articulation of societal interests and identities that both buttress and make demands upon this authority" (Ansell, 2004, p. 8). The question then concerns the "implications of a world in which the mutually reinforcing relations of territory, authority and societal interests and identities can no longer be taken for granted" (2004, p. 9).

Methodological Statism

The assumptions of the unity of public authority and a single public realm take us towards and what we are referring to as 'methodological statism'. If methodological nationalism refers to the tendency to take the nation state as the container of societies, the related but considerably less recognised term methodological *statism* refers to the tendency to assume that there is a particular *form* intrinsic to all states.¹ That is, all polities are ruled, organised and administered in essentially the same way, with the same set of problems and responsibilities, and through the same set of institutions. The assumed set of institutions that has become taken for granted as *the* pattern for the rule of societies is that found in the West in the twentieth century, and in particular the social-democratic welfare state that pervaded Western Europe in the second half of that century (Zurn & Leibfried, 2005, p. 11). Central – and, we might argue, unique – to this conception was that all four dimensions of the state distinguished by Zurn and Leibfried (resources, law, legitimacy and welfare) converged in national constellations, and national institutions. What Zurn and Leibfried make clear, however, is that "the changes over the past 40 years are not merely creases in the fabric of the nation state, but rather an unravelling of the finely woven national constellation of

its Golden Age” (2005, p. 1). To put it another way, both the assumption of a common set of responsibilities and means of achieving them, and the assumption that they are necessarily rather than contingently associated with each other, can no longer be sustained, outside a continuing methodological statism.

A further consequence of methodological statism is that the model of the state that became taken for granted in academic discourse across most of the social sciences is not one that was ever established or present in the greater part of what we refer to as developing countries. That model was not only imposed on the majority of postcolonial states that were created after the Second World War, but formal acceptance of, and attachment to, it became the main basis of membership of the ‘international community’. As has been pointed out by Ferguson and Gupta (2002), among others, that model of the state was never an effective means of conceiving of how the majority of developing societies were ruled. They see work on states based on two assumptions; *verticality*, which “refers to the state as an institution somehow above civil society, community and family” (1982). This top-down assumption is contrasted with *encompassment*, “the state, (conceptually fused with the nation) is located within an ever widening series of circles that begins with family and local community and ends with the system of nation-states” (ibid). This politically imposed simulacrum of a constructed form of rule has not only distorted attempts at introducing fair, efficient and effective forms of rule in those countries, but its acceptance as a valid and accurate account by academics as well as politicians, on the basis that the same term meant the same thing irrespective of circumstances, has equally distorted analyses of the governance of developing countries. The depth of the penetration of the assumptions of the ‘isms’, and their consequences, is summed up by Ruggie, writing of international relations, but in terms applicable to all social sciences. He sees them as displaying “an extraordinarily impoverished mind-set ... that is able to visualize long term challenges to the system of states only in terms of entities that are institutionally substitutable for the state” (1993, p. 143).

The main conclusion to be drawn from this brief discussion, then, is that one essential basis of any response on the part of comparative education to globalisation is to recognise that using ‘the state’ as an explanatory concept, without major qualification, is both to accept an inaccurate picture of the world and to perpetuate a particular outcome of political imposition. To put it briefly; one consequence of globalisation for comparative education, and for social science more generally, is to make it clear that the nation state should be regarded as *explanandum*, in need of explanation, rather than as *explanans*, part of an explanation. Or, to put it another way, the component parts of what is connoted by the nation state, need to be ‘unbundled’, and their status and relationships examined anew in a globalised world, by comparative educationists as by other social scientists. One effective means of summarising the points made here about methodological nation-statism is to display the bones of the argument diagrammatically.

Figure 1 illustrates the points made above about methodological statism by recognising that the national state is no longer the only, or taken-for-grantedly the most important, actor in the area of education. This means that the first thing that is to be compared as globalisation affects education more and more is the *governance* of

SCALE OF GOVERNANCE				
Supra-National				
National				
Sub-National				
INSTITUTIONS OF COORDINATION	GOVERNANCE ACTIVITIES			
	Funding	Ownership	Provision	Regulation
State				
Market				
Community				
Household				

Fig. 1. Pluri-scalar governance of education

education. By governance, we mean the combinations and coordination of activities, actors/agents, and scales, through which 'education' is constructed and delivered in national societies. The diagram seeks both to indicate, and at the same time to reduce the complexity of, what is involved in governing education, through 'unbundling' the range of activities, or functions, of educational governance. We identify four categories of activity that collectively make up educational governance (that are for the sake of exposition taken to be mutually exclusive and collectively exhaustive): *funding; provision or delivery; ownership; and regulation*. These activities may in principle be carried out independently of each other and by a range of agents other than the state. To utilise the figure directly, this means that all the cells can be empirically populated. However, one crucial point to be made here is that none of the relationships framed in this diagram should be seen as zero sum, as entailing mutually exclusive relations. The lines between the various cells are assumed to be porous rather than taken as border. Thus, the diagram also reflects the argument that it is neither 'natural' nor essential that all these activities are carried out by the state, or by any other single

agency. Rather, we may expect different combinations of agents, actors and scales in the governance of education, bearing in mind that at all three levels, agents, activities and scales, there will be hybrid combinations; respective examples are public–private partnerships, complex forms of ownership and ‘jumping’ scales from local to supranational. However, this does not mean that we are faced with choices between hybrid and ‘pure’ categories; we have, for instance, argued elsewhere, using the example of higher education in Europe, for the existence of ‘parallel’ discourses, which exist separate from each other at different scales, in that case, the institutional, the national and the European (Dale, 2008).

What this means in practical terms is that we need to focus on and seek to understand the implications for education, of not just a new range of actors who are now involved in the process, but of a new range of activities that it involves, and a new range of scales at which it takes place – as well as, of course, studying the interrelationships of these changes in actors, activities and scales.

One example of the kind of theorising made possible by the recognition of and escape from, methodological nationalism and statism is to conceive of ‘education’ as not necessarily and exclusively associated with the nation state, but as constituted through the complex workings of functional and scalar divisions of the labour of educational governance (Dale, 2003), which can mean any or all of a single locus of governance; parallel loci of governance at different scales; or hybrid forms of governance across scales, and/or activities, and/or agents. So, what is broadly meant by governance here is the replacement of the assumption that the state always and necessarily governs education through control of all the activities of governing, with what might be called the coordination of coordination, with the state possibly retaining the role of coordinator, or regulator, of last resort (Dale, 1997).

Educationism

At this point we will turn to the third, and possibly most controversial, ‘ism’, ‘educationism’. What is taken as education in comparative education, and far beyond, is as unproblematic as nationalism or statism. What is understood by education can be seen as equally fixed, abstract and absolute as the other two ‘isms’, as also requiring explanation rather than providing it, and as having similar consequences for analysis and understanding. It is crucial to note that the central elements of what we refer to as ‘education’ have themselves co-evolved in a rather similar way – indeed, alongside the evolution of the nation state (Green, 1993) – and may be in need of a similar kind of ‘unbundling’.

‘Education’ would appear on the surface to be the most constant of the three components we are currently examining. After all, everyone in the world has either been to school, or is to have the opportunity to go to school – which, interestingly, is how education is defined in the *Millennium Development Goals*. However, we also know both that what is understood by education differs widely and along multiple dimensions, and that the experience of schooling varies enormously – which, of course, has been the grist of comparative education from its inception.

More precisely, what we are calling ‘educationism’ refers to the tendency to regard ‘education’ as a single category for purposes of analysis, with an assumed common

scope, and a set of implicitly shared knowledges, practices and assumptions. It occurs when education is treated as abstract, fixed, absolute, ahistorical and universal, when no distinctions are made between its use to describe purpose, process, practice and outcomes. Particular representations of education are treated in isolation from each other, and addressed discretely rather than as part of a wider assemblage of representations – for there is no suggestion that the different representations of education have nothing in common with each other, or that the label is randomly attached. Far from it, it is the recognition that there are crucial relationships between different representations of education that are being occluded or disguised by the failure to distinguish between them that makes it so important to identify and seek to go beyond educationism. Educationism does not discriminate between uses of the term or make them problematic, and this makes it almost impossible for 'education' to be the object of comparison. This is compounded by two self-limiting parochialisms. Disciplinary parochialism restricts the bases for the study of education to approaches that come within the field, often, it seems, to work that contains 'education' in its title; this leads to analyses that share the same assumptions about the field – with the lexical equivalence removing the need to problematise them (see Dale, 1994). Institutional parochialism similarly refers to the tendency within all education studies to take existing education systems, institutions and practices in isolation as self-evidently the appropriate focus for their endeavours, and not to problematise these systems, and so on (Dale, 2005, p. 134).

Fundamentally, educationism treats education as a single, indiscriminate aggregate of representations that are qualitatively different from each other. There are three elements involved in addressing this problem. The first is to disaggregate, or 'unbundle' these different components. The second is to seek to establish the determinants and consequences of the boundaries and content of education as a separate sector; and the third is to focus on questions around how, by whom and under what circumstances, education is currently represented.

The first, which we have discussed previously (Dale, 2000), involves replacing the single term education by a series of questions that any understanding of education has to take into account. This essentially entails stipulative representations of 'education' with a set of variables. The basic idea behind the Education Questions is that rather than assuming/accepting that we all mean the same thing when we are talking about education, we pose a set of precise questions that can frame discussions and provide a basis for coherent discussion and systematic comparison. The questions are intended to provide some common ground where the nature and bases of different conceptions of education and its purposes, institutions and practices, might first be made clearer and eventually lay the ground for the kind of productive dialogue that their mutual neglect and incommensurability had denied. They are also intended to make different conceptions of education 'mutually intelligible' through providing a set of questions to which they are all able to respond, albeit, and expectedly, in a range of wholly different ways (Dale, 2006a).

The Education Questions

These questions are set at four levels (both to reflect the range of meanings that might be attached to 'education' and to make clear the complexity of the questions, none of which can be answered from within a single level alone).

These levels are those of educational practice; education politics; the politics of education; and the level of outcomes. Finally, it needs to be stated that the Education Questions still assume a national basis for 'education'. This is because that is the level at which empirically we still find the greater part of the activities that come under the heading of education taking place. However, as a glance at the Level 3 questions will confirm, this does not mean adopting a wholly, or exclusively, national focus. Nor does it mean that the national is the only or the most important scale of analysis. Nor does it entail any assumption of comparability between national levels; it is still important to problematise the comparability of the categories we use within and across levels and scales (see Table 1).

Education as a Sector²

One very useful approach to looking at the changes that have – and have not – occurred to, and within, national education *sectors* has been put forward by David Levi Faur

Table 1. The Education Questions

Level	
Level 1	
Educational practice	Who is taught, (or learns through processes explicitly designed to foster learning), what, how and why, when, where, by/from whom, under what immediate circumstances and broader conditions, and with what results? How, by whom and for what purposes is this evaluated?
Level 2	
Education politics	How, in pursuit of what manifest and latent social, economic, political and educational purposes; under what pattern of coordination of education governance; by whom; and following what (sectoral and cultural) path dependencies, are these things problematised decided, administered, managed?
Level 3	
The politics of education	What functional, scalar and sectoral divisions of labour of educational governance are in place? In what ways are the core problems of capitalism (accumulation, social order and legitimation) reflected in the mandate, capacity and governance of education? How and at what scales are contradictions between the solutions addressed? How are the boundaries of the 'education sector' defined and how do they overlap with and relate to other sectors? What 'education-related' activities are undertaken within other sectors? How is the education sector related to the citizenship and gender regimes? How, at what scale and in what sectoral configurations does education contribute to the extra-economic embedding/stabilisation of accumulation? What is the nature of intra- and inter-scalar and intra- and inter-sectoral relations (contradiction, cooperation, mutual indifference?)
Level 4	
Outcomes	What are the individual, private, public, collective and community outcomes of 'education', at each scalar level?

(2006), through a Policy Sector Approach to comparative political analysis. He suggests:

When we study sectors we examine them in two senses, the *Generic* and the *nation-specific* (cf. Vogel, 1996, p. 258). The generic characteristics of the sector are the most common features that a sector has; they exist beyond nations and regions and are applicable in principle to countries as different, for example, as Jamaica and Germany. The nation-specific characteristics of a sector reflect the changes in the generic features as the result of its integration into the national setting or context. To distinguish between generic and nation-specific characteristics of a sector is to be sensitive to the commonalities of ... sectors beyond nations but at the same time to understand that sectors are embedded in national settings and thus acquire characteristics of their own. Indeed, it makes sense to distinguish three different aspects of the sectors' *generic* and *nation-specific* characteristics: the technological, the economic and the political. (Vogel, 2006, pp. 368–369)

Our argument is that both the generic and the nation-specific (indeed, what counts as nation-specific) characteristics of education sectors have changed and are changing under the pressure of the political and economic aspects on the technological aspects. So, while this approach is extremely interesting and important in this context, for its value to be realised it is crucial not to confine the analysis to 'nation-specific' characteristics, but, in the spirit of the changing governance of education, to extend it to 'sub-national-' and 'supranational-' specific characteristics.

It might be argued that the two central elements of the technology of the education sector are its discourses and its practices, and that both are part of a globalised Western modernity, rather than the product or property of any particular nation state. The key evidence for the former is to be found in Meyer and colleagues' analyses of the global scripts of education (Meyer *et al.*, 1992). The most crucial, but also the most taken-for-granted feature of these discourses is that they essentially *equate education with (compulsory) schooling*. We see the continuing centrality of this association quite dramatically, for instance, in the formulation of the Millennium Development Goal for Education, which is 'to achieve Universal Primary Education'; this is even more explicitly related to schooling in Target 3, which is to 'Ensure that by 2015 children everywhere, boys and girls alike, will be able to complete a full course of primary schooling'. Progress towards the achievement of the goal is monitored by increases in the number of children able to access primary education. Thus the practices of education are to be found in the processes of schooling, which – as the Education MDG again shows – themselves have taken on an equally 'global' aspect, to the point where we may refer to them as a common 'grammar of schooling' (Tyack & Tobin, 1994; Dale, 2008). Together, then, these discourses and practices may be seen as comprising a significant part of the *technology* of the education sector. In a very real sense, they define what education *is*; 'education' is identified as that which takes place through the grammar of schooling and transmits a particular culture.

Essentially what we might see such discourses and practices explaining is the nature and tenacity of key elements of what have been historically (over a very long period – cf. Vanderstraeten, 2006) the generic features of education sectors – —in the technological form of the equation of education with schooling and common curricular categories across the world – and the political form of their support and diffusion by epistemic communities, professional experts and so on. What they do not explain so effectively is the economic aspect (Dale, 2000). However, more fundamentally, we see in education in an era of neo-liberal globalization, significant shifts in both generic and nation-specific features of the education as a sector, and in the relationships between them. That is to say, education as sector is changing in ways that make existing assumptions and forms of analysis – those that make up methodological educationism – unhelpful, even misleading. We might best elaborate this point by seeking to identify the changing nature of the sector's generic (or transnational) features, and of its political, economic and technical features. The essence of the argument here is that rather than a single set of shared features making up a fundamentally common and undifferentiated – generic– education sector, with the 'generic' being 'mediated' into the national in various ways, what we see is a breakdown of the generic characteristics of the education sector, and their replacement by what may be seen conceptually as a dual – or even triple, if we take into account the development of the sub-national level – set of features framing different 'education' sectors, with the relationship between them not confined to one of mediation, but taking forms such as hybrids and parallel operations. And further, we suggest that the basic characteristics that set the political, economic and technological aspects of the education sector are being framed by the work of international organisations, operating to a broadly common script (Dale, 2006b).

However, when we introduce the possibility of the sector extending beyond the national scale, a rather different story appears. Rather than an assumption of a requisite level of compatibility of national political and economic characteristics, we have been assuming that the forces of globalisation will both make the relationships of the political and economic at the national level problematic, and will themselves be formed into different but parallel sets of demands, definitions and expectations at supra- and sub-national levels. And here the emphases are rather different. At sub-national levels, the stakes concern largely political issues, of representation, voice, etc. At supranational level, the stakes are much more economic, as is witnessed in the constant reiteration of the importance of international economic competitiveness, and the paramount need for education to contribute to a global knowledge economy. We see here clearly the functional and scalar division of education governance, with issues around economic competitiveness shifting 'upwards', and issues around education's role in the distribution of opportunities within national societies remaining at the national level, or moving 'downwards'. The key difference here concerns the nature and status of the generic characteristics. At national and sub-national level they continue to form the terrain on which the political disputes about the distribution of opportunities, etc., are carried out. At the supranational level, however, they become themselves what is at stake, as they are perceived to be 'unfit for purpose' in a global knowledge economy (Robertson, 2005). It is for this reason that we see not just the rise of supranational

organisations in education, but their rise with a particular agenda to reform, reconstruct or transform the grammar of education. And the way in which we might imagine this being carried out is through the effective construction of parallel, or mutually imbricated but distinct, education sectors, and it is this attempted reconstruction of the generic characteristics of education that underpins the functional and scalar division of educational governance, which, in its turn, we suggest, is the key to understanding what should now be compared in education. So, we see a double movement of the generic characteristics of education; at the national and sub-national level, they are largely politically mediated, framed and interpreted in various, but not fundamentally challenging ways; at supranational level, there is rather a project of appropriating them, transforming them, and attaching them to the wider political project.

Representation

What the current era of globalisation has cracked open is the hegemonic status of what is a particular, spatially and temporally located representation of 'national education system' that is fused to, and directed by state power. This is perhaps seen most clearly in the representation of education constructed by the world polity theorists (Meyer *et al.*, 1992), which essentially sees it as a set of common curricular categories in nation-state controlled education systems. In the current era of globalisation, we can see major challenges to this hegemonic status, with a range of social and political forces operating at a number of scales (global, regional, local and national) seeking to undermine the nation state's claims to a monopoly over the sector (even when it is possible to show that it does not, and in many cases never has had a monopoly on the sector). These challenges are coming from within the national state itself (e.g., Singapore – see Olds & Thrift, 2004), as well as from global and international organisations (OECD, World Bank), firms (e.g., Microsoft, Jarvis – see Ball, 2007) and institutions (e.g., universities – see Marginson, 2006).

The idea of 'representation' as a moment in wider social processes is particularly useful in helping us see that discourses about knowledge production in society are semi-otic processes which have ideational and representational moments (Cameron & Palan, 2004). Being able to 'fix' a particular meaning at the ideational and representational by embedding this imaginary in social institutions enables power to reproduce itself and thus give it force (Jessop, 2004). However, as Jessop points out, this spatio-temporal fix is always temporary, and always challenged by the contradictions of capitalism.

There are now a number of competing imaginaries as to what education should look like in the modern twenty-first century that we outline below by way of three (illustrative and not exhaustive) examples. The point of providing these examples is to also show that these imaginaries are also getting some traction at scales beyond the 'national' sector, and if we are to appreciate the political import of these alternative imaginaries as challenges, we must also begin to look at them more systematically.

One particular representation of education is through the use of statistics in the form of indicators (such as with PISA run by the OECD), benchmarks (MDGs etc.) and thresholds. Paradoxically, in this context, the purpose is to make education systems more comparable (though not necessarily more diverse). So, from comparing, or juxtaposing, culturally distinct and diverse educational practices and goals, comparative education is propelled in the direction of ranking education systems against a common set of indicators.

It is also important to note that these statistical proxies for ‘education’ are not intended to represent collectively a means of more closely and commonly defining the existing range of purposes, policies and practices found in national education systems, but to create an overarching and common set of alternative purposes, policies and practices. They are intended not only to make education systems more comparable and commensurable, but to change and direct them in particular ways.

A second powerful form is in the use of new metaphors – for instance, ‘clusters’, ‘networks’, ‘hubs’, ‘hotspots’ – to drive and generate change (Robertson & Olds, 2007). These new imaginaries not only open up the space for new players into the knowledge production business, but they also operate in the parallel and hybrid spaces that are being opened by national states (cf. Singapore, and the ‘Singapore Global Schoolhouse’ – Olds & Thrift, 2005). These new assemblages operate outside rather than inside existing regulatory spaces; they also create institutional forms that are radically different from the knowledge production sector that we knew as the national state education sector.

A third example is the emergence of a powerful discourse and set of institutions that make up the for-profit education sector. There is an increasingly complex and sophisticated set of policy and social practices in this sector, including firms that supply information for investors in the sector, an annual index of publicly listed firms all trading in education services (Robertson, 2006a). This sector articulates with visions for education, as a once decommodified service sector, to be brought into the tradeable services sector regulated under World Trade Organisation rules.

A final example is the challenge to national education systems by the international organisations, including the OECD and World Bank, to re-imagine and rescript their role in modern twenty-first-century society (Robertson, 2005). At the heart of this criticism is the view that national education systems are products of the industrial era and have, as a result, reached their so called ‘use by date’. New visions are currently being offered as alternatives – such as networked schools shaped by personalised learning. While there is considerable variation in the responses by national actors, the idea of personalisation has seeped into the policy discourse of a number of countries.

Conclusions

In this paper we have tried to make three, connected, points. The first is that the chronic tendency within social science as a whole to make the national the focus of all analytic attention is more than ever problematic in an era of globalisation, while the tendency to reify, or fetishise, the national level can be seen to extend to the form of rule – ‘statism’ – and, in the case of comparative education, to the object of study, education. The second is that this exercise demonstrates that the three terms were never actually accurate – the state never ‘did it all’, for instance. And the third and most important point in the chapter is that each of these is in danger of generating from the core categories of comparative education a set of methodological ‘isms’, which have to be recognised and overcome if we are to progress comparative education in an era of globalisation.

However, when the national is still the commonest location of educational governance, ‘the state’ is the commonest form of its governance, and ‘education’ is still the

most useful portmanteau term for the activities we focus on, 'What is now to be compared? The point is, as we have tried to show in this chapter, that the 'nation' and the 'state' of today are not the same nation and state that they were even 10 years ago, and nor are the relationships between them the same. Similarly, 'education' has always been tacitly recognised as 'being' and 'doing' different things, but it has now taken on some qualitatively novel elements. In our view, this makes it all the more important to recognise the nature and the danger of national, state, and education becoming methodological 'isms', frozen in the assumptions of earlier eras. The danger can be seen in Smith's comment in the epigraph to this chapter; the concepts of national, education systems 'derive their power from appearing to be just what they always were'. The implications of this are by no means confined to the methodological. As we have tried to indicate in this chapter, they have very clear theoretical implications. Further than that, when that power is rooted in the maintenance of the idea that nothing has changed when everything has changed, the implications are political. As we have tried to show, 'education' is no longer, if it ever was, the national, or the public, issue, or the set of curriculum categories, that has featured in most studies of comparative education, and as long as we fail to recognise and act on that understanding, we become complicit in concealing the changes and their consequences not only from ourselves but from those we seek to enlighten. We see this most clearly in the way that 'education' is now being represented, where we may see a clear choice for comparative education, of becoming the (unwitting, if we do not see beyond the 'isms') accomplice of a redefinition of 'education' as framed through the medium of statistical representations, which, because of the very fact that it is so 'accountably' embedded, is both more difficult to identify and, especially to budge.

Involvement in forms of statistical representation is particularly ironic for comparative education (Theret, 2005; Novóa & Yariv-Mashal, 2003). It involves the purposive elision of national differences in pursuit of comparability for the purpose of more efficient and effective government, effectively both making national institutional boundaries more porous and laying the basis for both reconstructed and reshaped national education sectors, and at the same time of a new transnational education sector. In so far as comparative education is complicit in this, it is ironic that that involvement definitively undermines the national basis on which it has rested and has taken for granted.

Notes

1. Though the term embedded statism can be found, it is usually as a synonym for methodological nationalism.
2. We take the idea of 'educational system' in this context as included in 'education sector'.

EDUCATION, PHILOSOPHY AND THE COMPARATIVE PERSPECTIVE

Terence H. McLaughlin[†]

This article argues that a philosophical approach to education needs a comparative dimension and that a comparative approach to education needs a philosophical dimension. An analysis of the proper relationship between a philosophical and a comparative approach to education is developed with reference to needs, difficulties and opportunities.

Introduction

Although philosophy is, in one way or another, implicated in much of the work of comparative education, and comparative educationists themselves have not been inattentive to philosophical considerations, the role of philosophy in comparative education has not been brought into clear focus. One expression of this lack of focus is that relationships between the disciplines of ‘philosophy of education’ and ‘comparative education’ are relatively undeveloped: educational studies remain afflicted by ‘compartmentalization’. Regardless of the current state of relationship between formally structured educational disciplines, however, philosophical and comparative approaches to the study of education should be in an informed, sensitive and critical dialogue with each other. This article attempts to analyse the proper relationship between philosophy and a comparative approach to the study of education with reference to a range of needs, difficulties and opportunities. The article has three sections, dealing with ‘needs’, ‘difficulties’ and ‘opportunities’, respectively.

Education, Philosophy and the Comparative Perspective: Needs

In this section I shall articulate and defend two claims: (i) that philosophy needs a comparative dimension (in the context of education as elsewhere); (ii) that comparative education needs a philosophical dimension. Progress in relation to both claims requires attention to how ‘philosophy’ and ‘comparative’ in relation to education are to be properly understood.

Simon Blackburn describes philosophy as concerned with the exploration of the structure of our thought in its application to particular kinds of questions about ourselves (e.g., What am I? What is consciousness? Do I have free will?), the world

(e.g., Why is there something and not nothing? Does it make sense to think that the future might influence the past?) and about ourselves and the world (e.g., How can we be sure that the world is really like we take it to be? What is knowledge and how much of it do we have?) (Blackburn, 1999, pp. 2–3). The particularity (and peculiarity) of these kinds of questions consists in their non-empirical character and in their resisting simple procedures and criteria for pursuit and resolution. Questions of this kind arise from a form of fundamental critical self-reflection that extends to the ‘scaffolding of our thought’ (Blackburn, 1999, pp. 3–4).

One difficulty in offering a general account of the nature of philosophy is that any account is offered from, and is perhaps biased in favour of, *a particular tradition of philosophy*. Blackburn’s (1999) description of philosophy as ‘doing conceptual engineering’ (p. 2) and his dismissal of the proponents of certain schools of philosophical thought as ‘conceptual engineers who cannot draw a plan, let alone design a structure’ (Blackburn, 1999, p. 13) indicates his allegiance to a broadly analytic approach to philosophy. The analytical approach is averse to a conception of philosophy contained in the notion of ‘*a philosophy*’ where ‘*a philosophy*’ is seen as offering ‘an account on the grand scale of the nature of reality, the place of human beings within it, and the implications of all this for how people should comport themselves in the world and towards one another’ (Cooper, 2003a, p. 2). The traditional African beliefs referred to in the article by Bridges, Asgedom and Kenaw in this Special Issue is an example of *a philosophy* in this sense.

An aversion to a conception of philosophy of this kind is captured in Richard Peters’ early denial that philosophy (and philosophy of education) should be seen as offering ‘high level directives’ (Peters, 1966, p. 15; however, cf. Elliott, 1986). Any reference to ‘*philosophies* of education in comparative perspective’ involves the notion of ‘philosophy’ in the ‘*a philosophy*’ sense. As David Cooper (2003a) observes, “‘Philosophy’”, as the name of a very general intellectual activity, does not have a plural, no more than does “music”’ (p. 2).

The reality and significance of contrasting, and partly competing, traditions in philosophy is of clear importance for the concerns of this article, and this matter will be returned to in due course. For our present purposes, however, it is useful to illustrate what is involved in a philosophical approach to education by reference to a particular example of such an approach drawn from the broadly analytical tradition which has been prominent in Anglo-American philosophy of education since the 1960s and which has been interpreted in an increasingly broad way in recent years (on the question of increasing breadth of interpretation see, e.g., White & White, 2001). From the perspective of this tradition, a philosophical approach to education can be described as including interrelated and overlapping tasks of the following kinds (the categorization of tasks here draws in part upon White, 1987; Burbules & Warnick, 2004):

- (1) Analysing an educationally significant term or concept, showing its multiple uses and meanings, for the purpose of clarification. Terms and concepts apt for clarification in this way include (e.g.) ‘creativity’, ‘citizenship’, ‘active learning’ and ‘learning how to learn’. Clarity may not be a sufficient virtue in educational discourse, but (properly understood) it is a necessary one. ‘Analysis’ has been described as

the elucidation of the meaning of any concept, idea or unit of thought that we employ in seeking to understand ourselves and our world, by reducing it, breaking it down, into more basic concepts that constitute it and thereby showing its relationship to a network of other concepts or discovering what the concept denotes. (Hirst & White, 1998b, p. 2)

Analysis here should not be seen as uncovering an essential or ‘correct’ meaning of a term or concept in a putatively value-free way but can include persuasive definition for the purposes of particular arguments and lines of enquiry. The ‘connective’ nature of this kind of analysis, as involving an investigation of ‘how one concept is connected – often in complex and ragged-ended ways – in a web of other concepts with which it is logically related’ (White & White, 2001, p. 14) is particularly worthy of note.

- (2) Deploying the clarity achieved in (1) in a philosophical critical evaluation of an educationally significant term or concept, identifying hidden assumptions, internal contradictions or ambiguities in uses of the term and/or a disclosure of potential or actual partisan or controversial effects which the term has in professional and popular discourses. The notion of ‘critical evaluation’ here indicates that philosophers are interested not only in *clarity* but also in *justification*. For example, once ‘creativity’ has been clarified, the question of the senses, if any, in which ‘creativity’ should figure as an educational aim claims the attention of the philosopher. Analytic philosophers should not therefore be seen merely as ‘poor relations of dictionary compilers’ (White & White, 2001, p. 16).
- (3) Extending (2) into a philosophical critical evaluation of educational or educationally significant practices, policies, aims, purposes, functions, theories and theorists, doctrines, schools of thought and ‘visions’.
- (4) Developing positive arguments and proposals regarding the matters referred to in (3) including the philosophical articulation and justification of fundamental educational aims, values and processes. It is here that the move away from a preoccupation with ‘second order’ to substantive concerns, which has characterized analytical philosophy of education in the last 25 years or so, can be most clearly seen.

The analytical tradition in philosophy and philosophy of education has been described as unified not by shared doctrines but by a range of characteristic methods. It is, however, difficult to pin down the ‘methodology’ of the analytical tradition of philosophy of education as a whole with any precision, although a number of salient features can be safely identified. This tradition, with its characteristic emphases upon matters of meaning and justification, employs a recognizable style of argumentation, characterized by (amongst other things) the clarification and analysis of concepts, premises and assumptions, the consideration of counter-examples, the detection and elimination of defects of reasoning of various kinds, the drawing of important distinctions (e.g., between conceptual, normative and empirical questions), the use of ‘thought experiments’, a particular spirit of criticism and the structured development of argument. The analytical approach to philosophy of education is suspicious of unduly general statements and claims. It seeks a more fine-grained and detailed argument and debate in which attention to questions of meaning and justification act as an antidote to undue

generality. The approach therefore tends to begin its work not from general statements or theories but from specific questions and problems, seeking their illumination, where appropriate, from the resources of broader philosophical argument. (On the analytical tradition in philosophy of education see, e.g., Peters, 1966, Introduction, 1983; Wilson, 1979; Cooper, 1986; Elliott, 1986; Hirst, 1986, 1993, 1998; White, 1987, 1995, 2003; Soltis, 1988; Evers, 1993; Kohli, 1995, Part 1; Haydon, 1998; Hirst & White, 1998a, Part 1, 1998b; McLaughlin, 2000; Heyting *et al.*, 2001; White & White, 2001; Curren, 2003; Curren *et al.*, 2003.)

Although the respects in which education in general has philosophical needs cannot be pursued in detail here, it is clear that much educational thinking, policy and practice is not only apt for philosophical attention but requires it. There is, of course, no suggestion that philosophy alone can fully illuminate, let alone resolve, educational questions. Philosophical reflection in education must be conducted in a close relationship with other disciplines of enquiry and with the insights and imperatives of educational policy and practice (on these matters see, e.g., McLaughlin, 2000).

Although the notion of a 'comparative' perspective on education has yet to be brought fully into focus, it is possible to see at this stage how a philosophical perspective on education, properly understood, requires a comparative dimension. This can be illustrated by each of the features of the analytical approach that have been identified. In relation to (1), the analysis of an educationally significant term or concept, what counts as an educationally significant term or concept is (partly) related to matters of place and time: terms and concepts have a context and a history. Philosophizing about education cannot properly take place in a vacuum, including a societal, geopolitical and historical vacuum. If philosophical analysis of educationally significant terms and concepts is to be sufficiently informed and fruitful a comparative dimension is necessary, at least for any extended philosophical analysis. (On the need for a comparative perspective in philosophizing in general see, e.g., Smart, 2000; Cooper, 2003a. On a historical dimension to philosophical perspectives on education, see, e.g., Oksenberg Rorty, 1998b.) With regard to (2), a philosophical critical evaluation of an educationally significant term or concept, the kinds of criteria invoked for the justificatory judgements being made require assessment and endorsement in the light of appropriately fundamental scrutiny, and this properly involves consideration of the kinds of alternative criteria which a comparative perspective makes available for consideration. Similarly, in relation to (3), a philosophical critical evaluation of educational practices, principles and the like, a comparative dimension is an important resource in the enrichment of the range of possibilities and justificatory arguments open to view. This applies also to (4), the development of positive proposals in relation to the matters referred to in (3). The need for a comparative dimension to philosophy understood in analytical terms is inherent in the philosophical slogan 'Not all your questions answered, but all your answers questioned'. The proper pursuit of philosophy should lead to the problematization of the tradition within which it is conducted and in this, as in other matters, a comparative dimension to philosophizing is important and necessary.

Having attempted to illuminate the nature of a philosophical approach to the study of education by reference to one prominent approach, how can a comparative approach to the study of education best be understood? This is a matter that has

been the focus of a good deal of debate in the discipline in recent years (see, e.g., Crossley & Jarvis, 2000, 2001). An exploration of the notion of ‘comparison’ affords one way of illuminating matters here in a very general way for the purposes of the present discussion. ‘Comparison’ invites attention to: (a) *what is being compared with what* (e.g., teachers, schools, teaching methods and educational systems in differing cultural, national and regional contexts); (b) *the evaluative basis of comparison* (e.g., the norms and principles being invoked in making comparisons); (c) *the reasons and motives underlying the comparisons being made* (e.g., disinterested scholarly enquiry, a search for insights, etc., to be applied from one context to another); (d) *the methods used in making comparisons* (e.g., methods based on natural science, social science, and hermeneutic traditions). The comparative study of education stands in need of a philosophical dimension in relation to each of these four aspects.

In relation to (a), what is being compared with what, the need for a philosophical dimension emerges in relation to at least two matters. The first arises from the general point that many aspects of educational thinking, policy and practice are not only apt for philosophical attention, but require it. Since most of the subject matter for comparison in comparative education is educational in character, a philosophical dimension to the task of comparison is needed simply as a result of the general need of education for philosophical illumination. A philosophical dimension is clearly needed in relation to the ambition of comparative education to develop ‘an increasingly sophisticated theoretical framework in which to describe and analyse educational phenomena’ (Phillips, 2000, p. 298). The kinds of themes that comparative educationists often address in their theorization are rich in philosophical implication: globalization (see, e.g., Crossley & Jarvis, 2000), post-colonialism (see, e.g., Crossley & Tikly, 2004), indigenous education (see, e.g., May & Aikman, 2003), democracy (see, e.g., Davies *et al.*, 2002) and citizenship (see, e.g., Ichilov, 1988), as well as regionally based focuses of attention. The second matter in relation to which a philosophical dimension emerges is the illumination of the contexts in which the educational phenomena are located. These contexts include many aspects (cultural, anthropological, political, religious, etc.) that invite and require philosophical attention as part of the range of approaches and strategies needed to bring a given context into focus.

In relation to (b), the evaluative basis of comparison, the presence of the notion of ‘evaluation’ (with its implication of norms and principles) indicates a role for philosophy in matters of clarification and justification. Here, as elsewhere, the role of philosophy is a contributory one: appropriate forms of empirical enquiry have a place in the investigation of factual aspects of the identification of ‘like with like’. In relation to (c), the reasons and motives underlying the comparisons being made, philosophical considerations illuminate reasons and motives such as ‘a pragmatic science of educational borrowing’ and a ‘reading of the world’, discussed by Robert Cowen (2000). The latter, seen as involving wide-ranging cultural, historical and political interpretation, is ripe for philosophical illumination. With regard to (d), the methods used in comparison, Robin Alexander notes that comparativists write as much about the purposes and processes of comparing as they do about the outcomes, needing to be cautioned against ‘methodolatry’: a preoccupation with methods to the exclusion of actually doing research (Alexander, 2001, p. 513). According to Ninnes and Burnett (2003),

comparative education has been, despite ‘pleas for coherence of focus and method’, characterized by ‘eclecticism’ in that it incorporates ‘a range of theories and methods from the social sciences and intersects a range of sub-fields including sociology of education, educational planning, anthropology and education, economics of education and education and development’ (p. 279).

Be this as it may, philosophical considerations arise in relation to the articulation and defence of the research methodologies used in comparative education (see, e.g., Martin, 2003; Nannes & Burnett, 2003) and some comparative educationists have addressed these philosophical considerations directly (see, e.g., Nannes & Burnett, 2003). Patricia Broadfoot draws attention to the ‘deep methodological divide’ between qualitative methods and those of a more quantitative kind associated with a natural science paradigm, which has characterized comparative education (2000, p. 360). She calls for a more critical, theoretically informed, social science perspective in comparative education, involving a greater self-critical awareness, particularly in relation to the value-laden nature of problems, methods and conclusions (Broadfoot, 2000). She insists in particular that ‘[c]omparative educationists ... need themselves to be willing to engage in fundamental debates about values; about the nature “of the good life” and about the role of education and learning in relation to this’ (Broadfoot, 2000, p. 370). More precisely, she argues, comparative education has a responsibility to carry debate forward beyond ‘means’ alone to ‘ends’.

Education, Philosophy and the Comparative Perspective: Difficulties

If it is accepted that a philosophical approach to education and a comparative approach to education need each other in the ways that have been suggested, the difficulties involved in achieving the various forms of integrated understanding come into focus. Interdisciplinary research in general faces a wide range of well-recognized difficulties. A number of specific difficulties stand in the way of the achievement of the kind of collaborative understanding to which reference has been made. Four interrelated difficulties will be considered here.

The first difficulty arises from the important point that any attempt to philosophize about an educational context must be conducted in the light of a thorough understanding of the context itself in all its aspects, including non-philosophical aspects. This task involves the wide-ranging and complex general difficulties in achieving an adequately broad and deep understanding of educational realities and their ‘background conditions’ in given contexts (Grant, 2000) of which comparative educationists have long been aware. Detailed contextually illuminative work of many different kinds is indispensable as a background to philosophical work both inside and outside a particular context (for recent work of these kinds on some of the contexts discussed in this Special Issue see, e.g., Green, 2000; Tomiak, 2000; Cave, 2001; Harber, 2002; Jones, 2002; Yamashita & Williams, 2002). An adequate understanding of philosophizing about education in the context of Eastern Europe, for example, requires an understanding *inter alia* of the various non-philosophical factors which conditioned the

expression of ideas in the Soviet period and the various adjustments and compromises on the part of thinkers which this required (see the contribution by Godoń, Jucevičienė & Kodelja in this Special Issue).

A second difficulty relates to the aspiration to *relate* philosophical reflection to the educational (and other) realities of a given context. Some forms of philosophical reflection are extremely general (as in, e.g., reflection concerned with the determination of fundamental and general educational aims) and these kinds of reflection may not seek a direct relationship to educational practice and policy-making. Whilst this kind of reflection has its place, it needs to guard against the danger that it might descend into underdetermined and untethered rhetoric, which is both educationally irrelevant and philosophically suspect. Philosophical reflection which is related to, and grounded in, educational realities is often more adequate both educationally and philosophically. Little progress can be made in a philosophical discussion of citizenship education in contemporary China, for example, without attention to the reform of the history curriculum in the post-Mao period (on this matter see Jones, 2002). Oksenberg Rorty (1998a) reminds us that, even though European and Anglo-American countries share some general educational aims, ‘their distinctive political and religious histories, and their different socio-economic conditions, set them quite distinctive moral and educational problems’ (p. 10). Since solutions to (many) educational questions cannot be general, let alone philosophically general, philosophical reflection about these questions must be related to, grounded in and vary in the light of local considerations of various kinds. The task of exploring the relationship between philosophical reflection and educational realities in given contexts is, however, an extremely complex one. In part, this is because of the complexities involved in the general relationship between philosophy and educational policy-making and practice (on these complexities see, e.g., McLaughlin, 2000). For example, philosophical conceptions and principles can neither be simply read off from nor applied to educational realities. Philosophical influence on educational policy-making and practice is often exercised through the pedagogical *phronesis* (or practical judgement) of educational policy-makers, teachers and educational leaders. The general complexities to which reference has been made here are magnified in any attempt to explore the relationship between philosophy and educational policy-making and practice in comparative contexts.

The third difficulty relates to the task of achieving an adequate *understanding* of philosophizing about education across different contexts. One general aspect of difficulty here is practical in character, and this has been addressed in the first two difficulties outlined above. Attention will be focused here, however, on philosophical aspects of difficulty. A good starting point for the achievement of relevant forms of understanding is (perspicuous) *description* of various kinds. However, whilst a description of a philosophical tradition or of the development of philosophizing about education in a given context is necessary for understanding, it is not sufficient (for such descriptions see, in addition to contributions to this Special Issue, the account of philosophy of education in Spain offered by Jover, 2001). One prominent aspect of difficulty concerns the question of understanding *across philosophical traditions*. The analytical tradition of philosophy and philosophy of education, which was given as an example at the outset of this article, is manifestly not immune from criticism, most notably by

the continental traditions of philosophizing to which Paul Standish makes reference in his contribution to this Special Issue. Detailed educational visions derived from a philosophy in the sense indicated earlier (namely, overall and wide-ranging philosophical visions and systems) invite engagement with a particularly complex exegetical and interpretive task calling for considerable sensitivity and judgement. (For resources for this kind of task see, e.g., Deutsch & Bontekoe, 1997. Specifically in relation to the traditions of thought represented in this Special Issue, see, Albertini, 1997; Deutsch & Bontekoe, 1997, Chs. 7–15, 32–40, 43, 45; Masolo, 1997; Weiming, 1997; Cooper, 2003a, Ch. 3, 6, 9. On the relationship between indigenous peoples and Western philosophies see, e.g., Marshall, 2000.) The understanding of Confucian, Buddhist and Islamic philosophy, for example, presents a particular challenge to Western thinkers, not least because of the intricate relationship of these traditions with a whole way of life. One danger confronting Western thinkers is that of ‘orientalism’ inherent in the categorization of non-Western philosophies of education in the light of an assumption that all philosophical traditions that are not defined as Western constitute an identifiable ‘something’ simply by virtue of their being non-Western (Deutsch, 1997, p. xii). Deutsch also usefully draws attention to another danger in our imagining that the thought of another culture ‘has a clear unity and simplicity in contrast to the multifarious character of one’s own’ (1997, p. xiii). In fact, he insists, many of these ‘alternative traditions’ are characterized by depth, range, diversity and contention. There is no such thing, therefore, as a Chinese, Japanese or African philosophy (or philosophy of education) *per se*. A related danger is that of ‘primordialism’, where a particular group identity and its underlying philosophical articulation is seen as a timeless or eternal ‘given’. A related problem is the definition of what can count as ‘philosophy’ (see the paper by Bridges, Asgedom and Kenaw in this issue). A further danger in seeking to understand ‘philosophies’ is that of deducing educational implications from them in an over-simple way. This danger is illustrated by MacIntyre (1998) in his observation that whilst it is possible to ‘fabricate a collage’ out of relevant elements of the philosophy of Thomas Aquinas and describe it as his ‘philosophy of education’, this would be a travesty (p. 96). In these and other matters it is useful to approach the task of understanding ‘philosophies’ and their educational implications by starting from the educational realities that they mandate (for such an approach see, e.g., Halbertal & Halbertal, 1998; MacIntyre, 1998; Mottahedeh, 1998).

The fourth difficulty relates to the task of *engaging in dialogue* with philosophizing about education across different contexts and the related implied task of *making judgements* about the validity or adequacy of the perspectives and arguments encountered. It is important to note that differing philosophical perspectives and traditions do not necessarily stand in a relationship of mere juxtaposition to each other but in relationships of potential and actual disagreement and conflict. Deutsch (1997) insists that

one’s primary concern in the exploration of other traditions ought not to be that of simply finding more of oneself and what is familiar to one, but of learning about other possibilities of philosophical experience that can be opened up to one through cross-cultural encounter. (p. xiii)

Deutsch's claim leads to the thought that one may be a better philosopher and philosopher of education for having embraced a comparative perspective. The greatest difficulty that arises for educationalists from Western liberal culture in embracing a comparative perspective is that of being genuinely open to alternative conceptions, values and forms of argument that may conflict with Western liberal conceptions, forms of argument and values in significant ways (see particularly the contribution of Mark Halstead to this Special Issue). One difficulty here is the prevalence of notions such as 'postmodernism' that seem to call into question in different ways the evaluative project itself (on postmodernism see, e.g., Cooper, 2003b). The notion of 'Western liberal conceptions and values' is not, of course, transparent and unproblematic, although an unanalysed general sense of the notion can be invoked for the purposes of the present discussion (for further discussion see White, 2003). The practical and normative pervasiveness of these liberal 'conceptions, forms of argument and values' across the world is manifest, especially given the presence of democracy as one of its central elements (for the pervasiveness of liberal values in the case of Japan see, e.g., Feinberg, 1993). One general phenomenon worthy of note here is that of traditional forms of philosophizing being put under intense philosophical (as well as societal and political) pressure by liberal and democratic influences. Tu Weiming (1997) describes how the Western Enlightenment tradition gave rise to 'the most devastating disputation that the Chinese mind has ever encountered' (p. 22). Local forms of philosophizing, with their distinctive conceptions, values and forms of argument, face assessment from the putatively 'universal' standpoint of Western liberalism (see the contributions by Penny Enslin & Kai Horsthemke and by Bridges, Asgedom & Kenaw in this Special Issue) and many contexts seek adaptation to Western norms (see the contributions by Godoń, Jucevičienė & Kodelja and by Naiko Saito & Yasuo Imai). The major challenge for Western scholars here is not only that of reinterpreting local forms of thought and practice in the light of Western perspectives in an appropriate and defensible way (on liberal democratic educational aims and values in comparative perspective see Bridges, 1997), but also that of being sufficiently open to the genuine insights contained in local forms of thought. This is important not least because liberal conceptions, forms of thought and values are not unproblematic as they stand, but require enrichment and amendment from other sources. The inadequacies of Western liberalism with respect to securing a basis for contra-individualistic motivation and for communal needs and imperatives are, for example, widely felt. Openness to the genuine insights contained in local forms of thought requires considerable resources of sensitivity and imagination which extend beyond the philosophical. It should not, of course, be assumed that the challenges of dialogue and evaluation are confined to encounters with 'philosophies' such as Confucianism, Buddhism and Islam. There is plenty of scope for the exercise of sensitivity and imagination in the encounter between the analytical and the continental traditions in philosophy and philosophy of education (on this encounter see, e.g., Blake *et al.*, 1998).

The difficulties indicated here are substantial ones, not least the philosophical ones that have been identified. Any suggestion that the significant progress in relation to the difficulties is impossible, however, would seem to call into question the very possibility of a comparative study of education of any ambition and significance.

Education, Philosophy and the Comparative Perspective: Opportunities

What opportunities arise from an acceptance of the claim that a philosophical approach and a comparative approach to the study of education need each other? There is much scope here for a detailed discussion of possibilities. At the very least it would be a good thing if philosophizing about education became more sensitive to comparative insights and concerns and comparative education became more sensitive to insights and concerns of a philosophical kind. However, the need for sustained and sensitive interdisciplinary cooperation emerges clearly from the foregoing discussion. Here, flexibility is important: for example, philosophical aspects of research should not be seen as solely the province of 'philosophers' or 'philosophers of education'.

Dialogue with the unfamiliar is perhaps a key feature of the comparative approach to education. The suggestion here is that philosophers and comparativists in education are unjustifiably unfamiliar with each other's work and that dialogue between them should both enhance their work and indicate real opportunities for collaborative pursuit of their mutual and overlapping research interests.

Acknowledgement I am grateful to Robert Cowen for his advice and assistance in relation to the writing of this article.

COMPARISON: *QUO VADIS?*

Gita Steiner-Khamsi

The history of comparative education in the United States is often told in terms of revolutionary paradigm changes that revamped disciplinary focus, methods, and geographical reach (e.g., Altbach, 1991). Until the 1960s, comparative education in the United States was firmly based in the discipline of history, enamoured with single-country studies, and fixated on educational systems in Europe. By the end of the decade, the field was transformed into comparative *and* international education, with a composition of researchers and practitioners who were multi-disciplinary, cross-national and international in perspective. The name of its professional association was changed accordingly, from Comparative Education Society (CES) to Comparative and International Education Society (CIES). According to standard accounts, disciplinary “orthodoxy” in history gave way to a “heterodoxy” (Paulston, 1993), inclusive of different social science disciplines. Once history was abandoned as the only legitimate disciplinary foundation for the comparative study of educational systems, methodological changes followed suit. For some, the units of comparison became smaller moving from national educational systems to culturally bounded educative sites or communities. For others, they became broader, as the narrow focus on cross-national comparison in North America and Europe was suspended and academic curiosity and professional interests were redirected towards the Third World. In this chapter, I explore the proliferation of single-case studies that occurred at the expense of multiple case studies and other types of studies that involve comparison. I discuss the development turn that occurred in the 1960s and reflect on the repercussions it has had on methodological issues.

The Development Turn

There is a strongly held belief that the development turn of the 1960s was all positive. This general assessment, held by culturally oriented comparative and international researchers in the United States deserves scrutiny. It is accurate that the exclusive focus on Europe was abandoned and replaced with an orientation towards developing countries. It is also true that universities in the United States embarked in great style upon language and area studies in order to understand, but also win the hearts and minds of people in the Third World. Thus, the development turn marked the beginning of area

studies in the social sciences, humanities and in educational research. As discussed in more detail in other publications, the emergence of development and area studies was inextricably linked to the Cold War (Steiner-Khamsi, 2006; Steiner-Khamsi & deJong-Lambert, 2006). The fact that US comparative education went global in the late 1950s and in the 1960s, leaving the exclusive focus on Europe behind, had to do more with the global dimension of US interventions rather than with greater sensitivities towards people in developing countries.

Naturally, the development turn has had consequences for the selection of target countries of research, redirecting attention from high-income countries to low-income countries. In addition, as this chapter will demonstrate, the development turn also had considerable methodological repercussions. The push for single-case studies was clearly visible in the late 1950s and early 1960s when the National Defense Education Act (1958) and the Title VI Foreign Language and Area Studies fellowships created funding opportunities and other financial incentives to focus one's research on one country only. The focus on one geographic area was hardly new for comparative researchers. Given their kinship with historians, most early comparative education researchers have always seen themselves as area specialists, focusing on the history of education in a particular region. However, despite their area or context specialty, they did compare. Their analyses were embedded in contextual comparison. The situation, however, changed with the development turn.

In retrospect, the period of greatest territorial gain in comparative education was also the era of greatest methodological loss: with US political interventions targeting developing countries in the 1950s and 1960s, comparative education gained terrain. The field was no longer restricted to North America and Europe, but now encompassed any country with which the US government either entertained friendly ties or intended to forge a bond. Typically these countries were low-income, developing countries. At closer scrutiny, however, in the wake of paying more attention to developing countries, the project of comparison got suspended; not for its methodological limitations (e.g., difficulty of conducting solid contextual comparison) but oftentimes for chauvinist reasons: What is there possibly to learn from countries that are at a lower development stage? What "bourgeois education" in the United States was to Marxist-Leninist comparative education, and vice versa, education in developing countries was to comparative education in the United States: deemed too inferior to be comparable (see Steiner-Khamsi, 2006). With the boom of development and area specialists in the 1960s, funded by NDEA Title VI or other international fellowships, comparative and international education in the United States shifted towards qualitative single-country studies and lost, to some extent, its comparative dimension.¹

I would like to draw on Harold H. Noah's astute methodological observations. His comments capture very well my own criticism of the narrow research paradigm that emerged during the Cold War in the 1960s, and endured into the present:

Obviously, the 35 years since 1970 has seen tremendous organizational growth [in US comparative and international education]. Now, I will not speak at all; my lips are sealed on whether there has been qualitative improvement. There

certainly are differences. ... It is just very different in one way, but very much the same in another way. There are still, as there were before, lots and lots of single-country studies. And the big question always is: is that comparative education? Couldn't these studies just as well have been published in a sociology of education journal in that country, a political science journal in that country, or in an educational journal in that country? Why is it comparative education? That question still worries me. (Noah, 2006, DVD excerpt 00:15:28 – 00:16:58)

Cold-War Legacies

The development turn surfaced in the late 1950s and the early 1960s. This period marked the formative years for comparative education societies in different parts of the world, including in the United States. The decade coincided with the period of greatest competition between the two superpowers. The race over arms, technology and science was the fiercest during that time. For comparative education researchers in the United States, Soviet education was first an object of admiration, and in the following two decades a counter-reference for all that US education was not supposed to be, or never wished to become. At the founding meeting of the Comparative Education Society at New York University in 1956, the comparison between education in the United States and education in the Soviet Union was placed at centre stage.² Soviet education became a primary point of reference after the launch of Sputnik in 1957, a position reinforced once Yuri Gagarin became the first man in space in 1961. The Soviet downfall coincided with reports in the 1970s and 1980s in which dissidents spoke up against political repression and wrote about the widespread “economy of shortage” in socialist countries.

The influence of the Cold War has endured into the present and is evident in several contemporary features of US comparative and international education: first, the dominance of development and area studies in US comparative and international education, and second, the preoccupation of US comparative education with contrastive analyses of educational systems, conceived as diametrically opposed to the US system. In the United States, Sovietology was soon replaced by Japanology, followed by, after more than a decade of relative inertia, Islamology. Research on educational practices in the Soviet Union, Japan, or the Arab world – all regions that were seen at one time or another as economic or political threats to the United States – attracted great public attention and government funding. Finally, it is noticeable that US comparative education researchers rarely compare US education with education in other parts of the world. The only country that seems to serve as a “reference society” (Schriewer *et al.*, 1998) for educational reform in the United States is Great Britain, and even this is limited to market-oriented educational reforms. It seems there is no cross-national “policy attraction” for US analysts unless the reforms happen to emanate from Great Britain. This is in stark contrast to comparative education research in other countries that typically is enamoured with observing, documenting and publishing on reforms in countries that are perceived as comparable in context.

Language and Area Studies

In the United States, Congress passed the National Defense Education Act (NDEA) in 1958 to improve the quality of education (especially in math, sciences and foreign language instruction), and increase access to postsecondary and higher education by means of student loans and scholarships. A total of 10 areas (“titles”) were listed as eligible for federal funding. In higher education these new areas were Title II (student loans), Title IV (national defense fellowships), and language and areas studies development (Title VI). These funding priorities were initiated in 1958 and are, at a much lower level of funding, available to this date.³

A review of the NDEA budget for 1963 illustrates the preoccupation with socialist countries. The top-ranking foreign languages in the early 1960s were Chinese and Russian. More precisely, 16% of the budget for Modern Foreign Language Graduate Fellowships was spent for Chinese and 13% for Russian, followed by Arabic (11%), Japanese (10%), Spanish (10%) and other languages (Office of Education, 1963, Figure 20). The US–Soviet cultural exchange agreement of 1958 made it possible to take a peek behind the Iron Curtain in the form of organized study visits or tours. The interest in Soviet and East European languages and studies dropped drastically in the 1970s when government funding for foreign language and area studies dwindled. The number of doctorates earned in Soviet and East European Studies at American universities, for example, was at a peak in the decade 1970–1979 (3,598 doctorates), but then dropped by 60% in the period 1980–1987 (Atkinson, 1988).

Although the rhetoric for establishing NDEA was clearly embedded in the language of the Cold War, a great number of foreign language and area studies – regardless of whether they were in socialist countries or not – benefited from the infusion of government funds. In 1958, the US Commissioner of Education designated 83 languages as critically needed, and identified six of them for first priority in development: Arabic, Chinese, Hindi-Urdu, Japanese, Portuguese, and Russian (Spanish was added in 1996, after the announcement of the US-Latin American Alliance for Progress). By the end of 1962, four years after the implementation of NDEA, 56 of the 83 “critical languages” received federal support and 53 centres for area and language studies in higher education were established (Office of Education, 1963).

A brief comparison of US educational reform strategies used during the Cold War and during the ongoing War on Terror is appropriate here. Since 2006, there has been talk of establishing a new NDEA as an educational offensive to win the War on Terror. Education was, like today, directly tied to national and global security, and federal expenditures for education more than doubled in the 4 years after the NDEA of 1958 was implemented (Senate of the United States, 2006, p. 2). Even though the funds were administered by the Department of Education, the language used to pass the Act in Congress was soaked in the language of the military provoking anxieties that the country would lose the race in science, technology and arms. The magnitude of NDEA becomes immediately apparent if we compare the educational measures of the late 1950s with those of today that the US government has initiated to combat the War on Terror. Such a comparison is not far-fetched, since many political commentators compare September

11 (2001) to the launch of the Sputnik (October 1957). Both events were hyped as a shock to the nation and triggered a host of government interventions. In education, the parallel is striking, and reflected in the 2005 National Security Language Initiative,⁴ established by President George W. Bush, and the plan of democratic senators, backed by the Association of American Universities (2006), to pass the so-called New NDEA of 2006. However, if the Federal Government were to allocate the same amount for education in the interest of “national security” as it did with NDEA in 1958, it would cost \$400–500 million, that is, roughly 10 times more than it is spending nowadays for Title VI and Homeland Security fellowships (Brainard, 2005). In both eras – the Cold War and War on Terror – public expenditures for winning the “war” were massive. During the Cold War, however, the allocation of funds to the education sector was considerably higher – in fact, 10 times higher – than today.

Returning to the decade of development in the 1960s, the boost in federal support for higher education generated very attractive incentives to establish area studies as well as development studies in education and the social sciences. In fact, most graduate programmes in international and comparative education, educational development studies, or international education policy studies at US universities were established during the decade of development. Even though the decade ended in the late 1960s, it entirely transformed the field of US comparative and international education in that it moved the field away from comparative historiography and directed attention to (de-contextualized) cross-national comparison on one hand, and highly contextualized but non-comparative single-country studies on the other.

Contrastive Analyses

Andreas Kazamias criticizes the “social scientific metamorphosis of comparative education” (2001, p. 440) of the 1960s for having transformed comparative education into an ahistorical, and to some extent atheoretical field of inquiry. I would like to add to Kazamias’s observation that the early period of social scientific comparison in the 1960s witnessed, in the form of Sovietology and then later Japanology, the most shallow and de-contextualized mode of comparison: contrastive analyses. Methodologically, contrastive analyses need to be regarded as a specific type of comparison. They emphasize differences over commonalities. The typology of comparative case study analyses helps situate contrastive analyses within comparative methodology.

Table 1 presents the distinction made in comparative case study analyses between systems and outcomes (Berg-Schlosser, 2002, p. 2430; see also Przeworski & Teune, 1970). I use “system” and “case” interchangeably, because methodologically a case is a bounded system with its own “causal web” (Tilly, 1997, p. 49) that connects the large

Table 1. Comparative case study analyses

	Most similar systems/cases	Most different systems/cases
Most similar outcomes	msS-msO	mdS-msO
Most different outcomes	msS-mdO	mdS-mdO

number of variables in the case/system. The following table is especially useful for sampling decisions as it helps to make the selection of cases transparent.

In contrastive analyses, the researchers select cases/systems that they perceive to be “most different” from each other with regard to political system, educational system, or other system criteria (mdS), and expects to find different outcomes (mdO). The fourth quadrant in Table 1 represents the contrastive research design (mdS-mdO), in which the most different systems are examined with the expectation to find most different outcomes.

During the Cold War, the field of Sovietology satisfied populist demands for understanding why the US nation fell behind in the space and arms race. As a corollary, it made it acceptable in educational research to engage in contrastive analyses, that is, in comparison that is primarily directed towards identifying difference. As a result the two systems were dichotomized, and each was situated at the end of a spectrum. Soviet education was depicted as a system that relied on political indoctrination, whereas the US system supposedly fostered critical thinking in students. The list of binary constructions is long. Suffice it only to mention one more false dichotomy: the Soviet educational system supposedly emphasized access to education at the expense of quality of education. The dismissal of all that is perceived as typically socialist, such as, for example, universal and free access to education, has had disastrous effects on current reforms in the post-socialist region (see Steiner-Khamisi & Stolpe, 2006). The field of Sovietology was dropped, as some commentators notice (e.g., Foster, 1998), virtually overnight and replaced with Japanology. The new methodology was later on adopted for the research field Japanology producing a multitude of contrastive studies on US and Japanese education.

As with its older cousin Sovietology (see Noah, 2006), Japanology was populist in that it spread, at breathtaking speed, many broad generalizations and exaggerated statements about education. Furthermore – as William Cummings (1989), with reference to an expression coined by Joseph Tobin, has pointed out – American researchers tended to use a “yes, but” approach. The approach acknowledges the successes in the other educational system but at the same time “argues that these successes come at too high a price, a price Americans are unwilling to pay” (Cummings, 1989, p. 296). The exaggerated statements or myths about Japanese education included: inverted socialization paradigm (indulgence in early childhood, discipline in adolescence and early adulthood), education for the nation and the state, *kyoiku mama* (education-oriented mother), rote learning in schools, competition and suicide, elitist higher education, and social inequality. The US attraction for the Japanese educational system evaporated as quickly as it emerged due to the economic crisis in Asia. Within a short period of time, the “cautiously acknowledged strengths of Japanese education” (Cummings, 1989, p. 298) disappeared from American accounts. The Japanese educational system fell from grace and American observers started to make extensive use of studies that documented cram schools, student suicide and teacher burnout in Japan. Critics also emerged within the Japanese contexts. In Japan, the crisis talk surfaced at the turn of the new millennium and was used to justify the need for fundamental reform, such as the far-reaching curriculum reform that was implemented in 2002 (Tsuneyoshi, 2004).

Cross-National Policy Apathy

William Cummings is not alone in observing US disinterest in educational reforms of other countries:

The American interest in foreign educational systems has never been great, and as America has prospered to a position of international pre-eminence it appears that this interest has steadily declined: after all, what could the world teach America? (Cummings, 1989, p. 294)

Cummings published his observation in 1989, at the dawn of a new era in which the other empire, the Soviet Union and its socialist allies, was dissolved. Even more than before, the global posture of US policy analysts is noticeable. The isolationist status of US comparative education research or “self-referentiality” (Luhmann, 1990; Schriewer, 1990; see also Steiner-Khamsi, 2004) as the primary mode with which policy decisions are made in US educational reform, is a relatively recent phenomenon. Historically, the period of greatest US interest in educational systems of other countries (in particular Europe), was the second half of the nineteenth century and early twentieth century. Having this particular period of US comparative education in mind, Harold Noah and Max Eckstein (1969, p. 3) identified the period of educational borrowing, “when the desire to learn useful lessons from foreign practices was the major motivation” as the second stage in the development of comparative education.⁵ In a similar vein, Gail P. Kelly refers to the period in the history of comparative education, when “gentlemen traveled extensively and wrote about differences between nations” (Kelly, 1992, p. 14).

David Phillips coined the term “cross-national policy attraction” (Phillips, 2004; Ertl, 2006) to capture, from a historical perspective, the British interest in German educational provision over a considerable period of time. This interpretive framework is useful to understand the sustained interest of policy analysts of one educational system in the educational provisions, reform strategies, and other institutional features of another. In the case of US policy analysts, however, the inverse applies: an apathy towards experiences from elsewhere. It seems that there are no lessons to be learned from other educational systems and experiences elsewhere are not viewed as instructive for domestic policy development. Exceptions such as UK – United States cross-national policy attraction do exist, but there are, for sure, no contours of any pronounced policy pilgrimage by US policy analysts. In other contexts, cross-national policy attraction is the rule and not the exception. For example, the first few years after the release of the PISA results, numerous policy analysts from different corners of the world flocked to Finland to explore the reasons for the exceptional achievement of Finnish students in language literacy.

The Challenge of Contextualized Comparison

Contextualized comparison, or the move away from contrastive analyses, was only rediscovered in comparative education with the general cultural turn in the social sciences in the 1980s. Social anthropological and historical research, by the 1980s

grown closer together and paradigmatically regarded as siblings rather than cousins, positively influenced the methods discussion in the social sciences, educational research, and comparative education research. Not only did they render the exclusive focus on national education systems problematic by including other units of analyses (classrooms, schools, communities, regions, the world), but they also demanded a more hermeneutic approach to the study of educational systems that, by implication, pays greater attention to cultural and historical context. As a corollary, single-country studies or case studies offered themselves as a methodological tool in which all units of analyses, from the classroom to the globe, were interwoven and in which causal connections between the various units or layers of analyses could be made.

I would like to argue that the cultural turn in comparative education has dominated the field at the expense of other quantitative and mixed-methods comparative studies. Today, qualitative case studies or single-country studies are the most frequently used genre of methodological inquiry in US comparative and international education. To reiterate Harold Noah's point, mentioned earlier (Noah, 2006): "Why is this comparative education?" In principle, single-country studies could very well be comparative. At closer scrutiny, however, the majority of single-country studies published in comparative and international education journals are not comparative. This applies especially to those case studies that refrain from any of the three conceivable types of comparison: comparison over time (historical analysis), across space (cross-cultural or cross-dimensional analysis), or across socially agreed standards (e.g., OECD/IED-type of studies). Arguably, cross-national comparison is but one of several methods of comparison. A more frequently used method in comparative education was, until the 1960s, comparative historiography, when education in a "foreign country" was analyzed and compared over a long period of time. Demands for more cross-dimensional analyses have been made (Bray & Thomas, 1995), but rarely implemented in research. I regard case study research as a very powerful tool for policy analysis under two conditions: the researcher must clearly define the case (what does the case stand for?) and the researcher needs to convincingly construct causal stories within the case (Tilly, 1997, p. 5) by investigating how the various actors, agendas, policy levels, and educational practices relate to each other. As a corollary, a case study must be regarded as a thick description based on a small sample size (small N), but many variables (Ragin, 1997).

For example, in the case study on educational import in Mongolia (Steiner-Khamsi & Stolpe, 2006), we had to come to grips with the 'fuzziness' of case studies (Bassey, 2001, p. 6; see also Hammersly, 2001; Pratt, 2003). The uncertainty of predictions relates to the contextual information in which a case study must be nested. Even though we have, every now and then, included observations made in other contexts, the bulk of our findings were deeply rooted in the Mongolian context of educational reform. The fuzziness of case studies is both a methodological weakness and strength. What accounts for the fuzziness is the complexity of an issue (many variables) that unfolds when attention is paid to the different actors, agendas, units of analysis, and practices within a context. In the Mongolian case study, for example, we consistently used three units of analysis, corresponding to three distinct policy levels (policy talk, action, implementation); the lists of actors, agendas, and

practices varied for each chapter in the book (Steiner-Khamsi & Stolpe, 2006), and would be too long to reiterate here.

Solid comparative studies or “contextual comparison” typically draw from information, which are specific to the case(s), as well as from comparison with other cases. The problem I observe, however, is that many studies either do one or the other. That is, they either focus on one case – and are highly contextual within that case – but lack a broader frame of reference or perspective, oftentimes because the researcher (over-)emphasizes contextual differences and, thus, refuses to compare. Or, they are very exact with describing, for a number of cases, changes over time but miss out on important details for each case. These methodological differences are not merely nuances for they produce different theories, depending on which method of inquiry and perspective is utilized. For example, in the fascinating intellectual debate on whether there is an international convergence towards a single (international) model of schooling, methodological considerations are instrumental for determining whether the scholars believe or disbelieve in an international convergence of schooling that supposedly results from globalization.

Globalization is commonly viewed as an act of de-territorialization (Appadurai, 1990). By implication, globalization studies investigate the transnational flow of money, communication, beliefs, or, as is the case with comparative educational research, the travel of educational reforms from one cultural context to another. As students of globalization, we are able to draw on an established tradition in comparative education with investigating policy borrowing and lending (Noah & Eckstein, 1969; Holmes, 1981) from one context to another, and by implication, with examining transnational or global phenomena. In this key research area of comparative education, the cultural turn in the social sciences that, more specifically, corresponds to the development turn in comparative education, has had vast repercussions for the study of transnational policy borrowing/lending or globalization in education. What we are witnessing today is a bifurcation of comparative borrowing/lending research with one branch featuring cross-national comparison, and the other emphasizing culture or local contexts. Within this binary space, one group of scholars – associated with neo-institutionalist sociology – investigates long-term changes to identify a convergence of national educational systems, beliefs, and practices over time (Meyer & Ramirez, 2000; Ramirez, 2003; Baker & LeTendre, 2005; Kamens & Benavot, 2006). Diametrically opposed is a group of researchers, representing a specific orientation within cultural anthropology, that produces single-country studies to emphasize that global or “external” forces are heavily reinterpreted and adapted locally, and therefore only have a limited impact on local structures, beliefs, and practices (Anderson-Levitt, 2003).

Although the disagreements between the two camps – neo-institutionalist sociologists and anti-neo-institutionalist cultural anthropologists – have ignited a lively debate on strengths and shortcomings of each interpretive framework, we lack a discussion on methodological constraints and disciplinary blind spots. The single-case studies presented in Anderson-Levitt’s book criticize neo-institutionalism or world culture theory from an anthropological perspective. In her edited volume (Anderson-Levitt, 2003), each of the nine case studies reflects on how exogenous influences in education (global forces) have been interpreted in a particular community (local encounter).

As announced in the title of the book, the case study authors investigate “local meanings” to visions and pressures of “global schooling,” and find a multiplicity of (local) meanings. Their criticism builds on this finding, and serves them as an argument to denounce the homogenizing effects of globalization that world culture theory has asserted. The contributors illustrate that, although choice, student-centred learning, outcomes-based education, marketization of schools, etc., went global, they neither replaced already existing models nor do did they mean the same in various cultural contexts. For example, choice with regard to the language of instruction, propelled by US missionaries in Tanzania (Stambach, 2003) is, for a variety of reasons, a different “thing” altogether than the choice in math instructional methods that factions of the PTA association in California were combating (Rosen, 2003). Such variations matter a great deal to the contributors of the edited volume for these differences reveal that individuals in a particular community have a shared understanding of what global reform models mean in their own cultural context. They criticize their antagonists, the scholars of world culture theory or neo-institutionalist sociology, for taking global schooling models at face value without scratching at the surface, and examining how they play out differently at the community level. To phrase it more bluntly, world culture theorists seem to have mistaken “brand name piracy” such as choice, outcomes-based education, student-centred learning, etc., hijacked from one corner of the world and catapulted to another, as heralds of an international convergence of education.

In contrast, neo-institutionalism or world culture theory acknowledges local “variations” (Ramirez, 2003, p. 247) of the global model of schooling, but regards them either merely as manifestations of “loose coupling” between official and enacted policy, or views them as part of a world culture that promotes difference and diversity. It simply is not interesting to comparative sociologists to analyze how and why exactly the same school reform – let’s say “choice” – is interpreted and implemented differently in various cultural contexts. There is little to gain for them in the way of making better sense of trends at system level. The fact that policy-makers in different parts of the world justify choice, vouchers, privatization of education, and a host of other neo-liberal reforms in terms of “progress” and “justice” only reconfirms their theory on the international convergence in education.

Anthropological research has much to offer for understanding how globalization plays out in communities. They have the methodological tools to understand what “globalization” means to groups and communities: why “it” is appropriated or rejected, and how “it” is adapted and modified to their cultural contexts. By analyzing the local encounters with global forces, we learn more about cultural contexts than we do about “globalization” per se. In contrast, defining the global or “the-out-there” (Anderson-Levitt, 2003, p. 17), is not the strength of this kind of anthropological research. In fact, in a few case studies presented in Anderson-Levitt’s edited volume (2003), the external forces or globalization (“out-there”) was actually “in-here.” These are a few constructions that I noticed in the volume: The authors either assumed that the global is manifested in neo-liberal reforms (choice, economic efficiency programs), personified in specific groups viewed as outsiders (Russian immigrants in Israel, US missionaries in Tanzania), or, if all other methods of distilling the global from the local failed, simply used a quasi-subtractive method (the residual from what already

existed locally, was established as the global) and thus run the risk of having given attention to anything new. However, not everything that is “out there in the larger world” (Anderson-Levitt, 2003, p. 55) qualifies as global. Precisely because the global is frequently “in here,” several anthropologists have pointed out that concepts of spatial determinism or “the local,” are of limited value (e.g., Camaroff & Camaroff, 2001), and at the same time acknowledged the disjunctures of various transnational developments (Appadurai, 1990). This other group of anthropologists forces us to explicitly address the blurring lines between global and local, between external and internal, and to render the overlap of these two spaces to an object of study.

The endeavour to investigate the impact of globalization on education is more ambitious than it appears. The greatest challenge is to avoid falling into the trap of first establishing national boundaries, only to demonstrate afterwards, that these boundaries have indeed been transcended. Reforms do not have a home base, a territory, or a nationality, and therefore do not “belong” to a particular educational system. Individuals conceive reforms and, depending on where they are geographically and institutionally situated and how well they are globally networked, succeed in having their ideas disseminated worldwide. Important for comparative research is therefore the question as to why policy-makers and analysts *refer to* globalization, that is, generate reform pressure by pointing at educational reforms in other countries.

Comparativists Who Understand

By way of concluding my methodological observations, I highlight a few of the challenges of comparison that I mentioned earlier. The development turn of the late 1950s and early 1960s reinforced a tendency that already existed in comparative educational research: a great attention to context (culture, history, language) and a reluctance to compare unless a strong case could be made for comparability of contexts. As Noah mentions (Noah, 2006), the majority of articles in the journal of the US Comparative and International Education Society (*Comparative Education Review*) are single-country studies. Authors who do compare risk being criticized for being culture-insensitive or for engaging in de-contextualized comparison.

Given the caution towards comparison, the question of comparability has taken on monumental significance. Of course, nothing is comparable per se (Tilly, 1998; Ragin, 1997). Unless the researcher identifies a commonality, or more accurately constructs a specific dimension against which two or more cases/contexts can be compared, comparison is ruled out. Establishing a *tertium comparationis*, that is, generating, justifying and applying a construct against which two or more educational systems are compared, has become one of the major preoccupations of comparative researchers. The *tertium comparationis* changed over time. From a historical perspective, “civilization”, “modernization”, “development” and “democracy”, only to list the major constructs utilized in North American comparative education research, has each served as an interpretive framework or as *tertium comparationis* for justifying comparison across contexts or cases, or – in early comparative education research – across national educational systems. The early comparativists, such as Sadler and Kandel, used civilization theory to

construct comparability. Groups, people and nations that were perceived to be at the same stage of “civilization” were deemed comparable (Steiner-Khamsi, 2002; Welch, 2000). Since the newly formed nation states of the nineteenth century were supposedly at the same (high) stage of civilization, the transatlantic transfer of educational models was justifiable. Similarly, US and British researchers at the turn of the last century believed that African Americans, Native Americans, and Africans (and later all colonized people in the British colonial empire) were regarded to be at the same (low) stage of civilization. Since these groups were perceived to be comparable, transfer of educational models from one continent (North America) to another (Africa) was viewed, methodologically and morally, as permissible. A good case in point is the transfer of “adapted education” from Hampton and Tuskegee (schools in the segregated South of the United States) to Achimota (colonial Ghana) in the 1920s (Steiner-Khamsi & Quist, 2000).

There is a need to write a historiography of comparison that accounts for changing notions of comparability. With the proliferation of indicator research in the 1980s and 1990s, development was framed in quantitatively measurable terms (HDI, GDP, GNP, etc.). Arguably, the quantification of development makes the justification for comparison too easy for comfort. Coefficients tend to conceal, perhaps more than theoretical concepts, the assumptions of a stage model which ranges from 0 (“not developed”) to 1 (“developed”). At the same time, we need to acknowledge positively that the vast number of development indicators is evidence that definitions of development have become diversified. Even though each and every international organization advances its own stage model with regard to dimensions that matter to them (e.g., economic dimensions for development banks, children and women’s rights for UNICEF, absence of corruption for Transparency International, etc.), we lack a critical reflection of how data banks on development and other indicators, established at each and every international organization, actively contribute to the construction of “development” or “under-development”.

As mentioned earlier, we have behind us more than two decades of growing skepticism about the place and purpose of cross-national and cross-contextual comparison (Steiner-Khamsi, Torney-Purta & Schwille, 2002). Attacks against large-scale country comparisons are not singular incidents. Furthermore, they are not carried out by cultural anthropologists only. Nor are these attacks exclusively directed to sociologists, as the debates around world culture theory seem to suggest. However, these attacks neglect the existence of researchers in comparative studies that simultaneously contextualize *and* compare. For example, Charles Tilly emphasizes, not only in his widely read historical analyses of nation states (or “national states” as he labels them) and citizenship, but also in his methodological contributions to comparative sociology and history, the need to simultaneously examine intra-national and transnational interactions. He reminds researchers in comparative studies to explore the “causal stories” that are embedded in each case or context and that rest on “different chains of cause-effect relations” (Tilly, 1997b, p. 50). To name one concrete example, his comparison of several European “revolutionary situations” in the early 1990s, and his discussion of the different political “outcomes” in these Central and Eastern European countries, is one of his methodological masterpieces integrating cross-national comparison and contextual analysis. For the research field of comparative policy studies in education,

Tilly's methodological approach helps us to understand why, in a given context, one policy solution is selected over another and how external factors influence and are woven into local politics.

In comparative education research, the group of scholars advancing contextual comparison has been quite productive. This group is very visible in one of the traditional research areas of comparative education: cross-national policy borrowing and lending. Embedded in a theoretical framework of system theory (Luhmann, 1990), Jürgen Schriewer and his colleagues propose to study the local context in order to understand the "socio-logic" (Schriewer & Martinez, 2004, p. 33) of externalization. According to this theory, references to other educational systems serve as leverage to carry out reforms that otherwise would be contested. Schriewer and Martinez also find it indicative of the "socio-logic" of a system that only specific educational systems are used as external sources of authorities. Which systems are used as "reference societies" and which are not tells us something about the interrelations of actors within various world-systems. I found the concept of externalization useful for comparative policy studies as it enables us to understand how "global forces" are sometimes locally induced with the purpose of generating reform on domestic developments (Steiner-Khamsi, 2004). I found that it is precisely at a moment of heightened policy contestation that references to other educational systems, to "international standards in education" broadly defined, or to globalization are made. I concluded that cross-national policy borrowing, discursive or factual, has a certification effect on domestic policy talk. Teasing out the interrelation between the local and global requires a bifocal focus that enables us to investigate – in meticulous detail and across various policy levels – the local context, and to simultaneously compare the particular case with other cases that had either a similar or a different policy outcome. Comparativist after comparativist, from Michael Sadler to Brian Holmes to Robert Cowen, warned against analyzing education out of context and using comparison in ways that blindly advances cross-national policy borrowing. Robert Cowen (2000) revisits Sadler's hundred-year-old question: "What can we learn from the study of foreign systems?" Cowen illustrates that, in practice, the comparative study of educational systems has fuelled a "cargo-cult", that is, a wholesale export and import of educational models across national boundaries. Cowen is among a growing group of researchers in comparative studies that insist on the need for more contextualized comparison. This group of researchers attempts to seriously challenge the contention that those who compare do not understand, and those who understand do not compare.

Notes

1. It is important to keep in mind that the shift of comparative education towards single-country studies did not necessarily occur in other countries and continents. In fact, the comparative education section of the European Educational Research Association (EERA) excluded all abstracts and presentations that lacked an explicit comparative dimension and delegated them to other sections of EERA. There was a lively debate at the European Conference for Educational Research in Geneva (September 2006) whether presentations dealing with one case only qualify for the comparative education section.
2. Study of Soviet education was the only area specific topic at the 1956 meeting. All other topics dealt with theories, methods, or concepts of comparative education (see Campisano, 1988, p. 35; Brickman, 1966). George Z. Bereday was asked to compare education in the United States with Soviet education

- (Bereday, 1957). The other three topics, scheduled by the co-organizers William Brickman and Gerald Read, were: (1) the theoretical foundations of comparative education; (2) the current importance of the subject as an area of study and research; and (3) an examination of definitions, aims, and values of comparative education and the concept and general principles of comparison. The participants discussed the practical applications of comparative education in the second half of the programme.
3. In 2005, 60 universities were eligible to administer Foreign Language and Area Studies (Title VI) fellowships. The budget for 2005 fiscal year was \$28.2 million and 926 year-long fellowships and 635 summer fellowships were funded. The Title VI international education programs remained the largest source of federal funding in which education is explicitly tied with national and global security. It is followed by the Homeland Security fellowship (created in 2003) which disbursed \$15 million and the National Security Education Program with a budget of \$8 million in 2005 (Glenn, 2005).
 4. In 2002, the US army reported the “serious shortfalls of translators and interpreters in 5 of its 6 critical languages” (Senate of the United States, 2006, p. 3): Arabic, Korean, Mandarin Chinese, Persian-Farsi and Russian. The National Security Language Initiative is supposed to remedy the situation by producing 2,000 “advanced speakers of critical languages” by 2009 that could be employed by the US army, intelligence and government offices (Liebowitz, 2006, p. B29).
 5. Noah and Eckstein (1969) identify the following five stages in the development of comparative education: (1) travellers’ tales, (2) educational borrowing, (3) international educational cooperation, (4) studies on society and schooling, including national character studies, and (5) social science foundation of comparative education. Noah and Eckstein have been criticized for their assertion that the early philosophical and historical emphases of comparative education have been replaced with one devoted to the social sciences, and especially for their enthusiastic endorsement of quantitative research methods in comparative education. Their historical account of the five stages is in line with what other scholars have noted. Perhaps, their enthusiasm about the great potential of quantitative research could have been more guarded, but – despite assertions to the contrary (Masemann, 2006; see also Steiner-Khamsi 2006, note 12) certainly there is no doubt that history and philosophy were the foundation of early comparative education research, and any other educational research for that matter, in the United States and in Europe.

DIGITAL TECHNOLOGY AND EDUCATION: CONTEXT, PEDAGOGY AND SOCIAL RELATIONS

Andrew Brown

Introduction

Digital technology, and particularly information and communications technology, is frequently, but rather obliquely, referred to in contemporary academic comparative education. Most commonly the capacity to enable rapid international communication and networking is invoked as a facilitating factor in the process of globalization, or more generally as a key component in the formation of contemporary societies, be they identified as postmodern, late-modern, post-industrial, knowledge-centred or some variant of these. Very rarely, however, is sustained attention given to the characteristics and uses of these technologies themselves. This is a pity, since lack of critical scrutiny can lead us to accept some questionable assumptions about what digital technologies do and can do in relation to education and society.

It is all too easy to get drawn towards utopian visions which, for instance, view virtual worlds as new frontiers in which material constraints and physical oppression can be cast aside in the creation of new digital democracies, throwing open access and opportunity to disenfranchised and marginalized groups. Likewise, the virtual dystopian complement of this, the potentially unbounded and unregulated moral and cultural corruption of society, is equally easy to envision and elaborate. A comparative perspective, which by definition grounds and contextualizes activity, on the uses of digital technology would caution and protect against the collapse into any single unitary perspective. Comparison as an activity demands difference, diversity and, at its best, dialogue, and as an academic activity requires explanation, understanding and theoretical development. With respect to digital technologies, however, such academic comparative scrutiny is largely absent.

This lack of specific attention to digital technology constitutes a further lost opportunity in the development of comparative education. Cowen (2006) argues that:

the academic field of study called comparative education must always deal with the intellectual problems produced by the concept of context (the local, social embeddedness of educational phenomena) and transfer (the movement of educational ideas, policies and practices from one place to another, normally across a national boundary); and their relation. (Cowen, p. 561)

The academic study of digital technology and education presents copious opportunities to explore the pedagogic, social and cultural dynamics of embedded educational and cultural practices, and offers an ever-expanding constellation of examples of the transfer of technologies and practices from one context to another. Above all else, it offers rich opportunities for the exploration of the effects of re-contextualization, both as these technologies and associated practices move from one context to another and as the technologies themselves act as a conduit for the transfer of knowledge and the bringing together of individuals and groups, and their pedagogic, cultural and social practices. In the light of this, rather than address the local and global impact of digital technology in general terms, in this chapter I will address a number of dimensions, and specific instances, of the educational use of digital technologies in a range of contexts.

In planning and compiling the *World Yearbook of Education 2004* (Brown & Davis, 2004), which addressed the theme of digital technology, communities and education, Niki Davis and I focused on the uses of digital technologies by individuals and groups in a variety of contexts, both in their own learning and in the creation of learning communities and networks. As in this chapter, we worked with a broad conception of digital technology, taking this to include both technologies for the production and manipulation of digital artifacts, such as digital video and audio, and digital communication technologies and media, such as the internet and mobile telephony, signifying a convergence of digital production and distribution. We also set out to explore the use of digital technologies in a wide range of contexts, for instance in individual and collective activities, formal and informal educational settings, and economically rich and poor communities. The resulting collection was correspondingly diverse in the perspectives adopted and the substantive focus of the papers, ranging from consideration of the impact of digital technology on pedagogic modes and school curricula through the technological augmentation of everyday cultural practices and economic activities of children and adults to the extension of the locality, networks and community from geographic into virtual space.

In this chapter I will take up some of the key themes explored and consider these in the light of recent developments in practice. In particular, I want to explore the relationship between the practice and its context in relation to the production and reproduction of social relations in and through education, a distinctly sociological concern but not incompatible with Cowen's framing of academic comparative education. Engaging with digital technologies and their uses challenges our conceptions of what constitutes a context (by, for instance, the facilitation of virtual communities) and, though their capacity to act as a conduit within and between contexts, foregrounds the need to understand the processes and effects of transfer.

Learning Technologies

Alexander's (2001) international comparison of primary education in five countries illustrates the complexity of the relationship between the practices of formal education and the historical and contemporary political, social, cultural and economic conditions of the societies in question. The organization of pedagogic spaces, modes of regulation,

the content of the curriculum, student expectations, the construction of identities, the recognition of achievement and so forth are interrelated, are shaped by a complex of factors from the systemic to the individual level and vary across contexts. Digital technologies present a number of challenges to these practices, but clearly, given the manner in which practice is shaped in different contexts, these challenges take different forms and have diverse consequences.

As Kress (2004) has argued, the manner in which information is presented on the screens of computers and portable digital devices, for instance, challenges existing notions of literacy. As multi-modal forms of presentation and representation become increasingly common, a demand grows for the facility to produce and interpret not only linear written text, but also audio, digital still images, animation, video and so on. The bringing together of these forms of representation into complex non-linear hyper-texts further extends what we might consider to be basic communicative competence in the digital age:

The media of the new screens provide, simultaneously, means for the production of text and for its dissemination. Given the facts of social diversity, the disappearance, or attenuation, or absence of central power, and above all the displacement of the state by the market as the telling source of power, there is now no longer a canonical mode of representation. Rather, the characteristics of the audience (now in any case no longer seen as citizens but as consumers), their needs, wishes and their real or attributed desires move into the foreground. Representational mode becomes a matter of design: does this group prefer image or writing? Moving image or still? What ensemble of modes will serve best my rhetorical needs vis-a-vis this audience? (Kress, 2004, p. 38)

The potential impact of digital technologies on schooling is itself multi-dimensional. The incorporation of competences relating to the use of digital technology into the curriculum of the school clearly transforms the content of the curriculum, but more than this, argues Kress, the productive potential of the creation of multi-modal texts demands the radical revision of underlying models of learning from the reproduction of meaning to the individual and collective production of meaning, from a curriculum based on transmission to a curriculum based on design. Furthermore, as Jewitt (2003) has observed, the move away from the acquisition of 'competences' to the fostering of creativity and innovation, with the consequent reshaping of the curriculum and of pedagogy, creates a need for transformation of the practices of assessment within the school:

The multimodal reshaping of the construction of curriculum entities and the practices of reading brought forth by the multimodal context of learning, in particular computer mediated learning, have important consequences for literacy and assessment. There is a need to move beyond language in order to understand the complexity of learning and literacy in the multimodal environment of the classroom. Further, in order to assess what it is that is learnt assessment needs to re-focus in order to attend to the full range of modes involved in learning. (Jewitt, 2003, p. 100)

In this way the use of digital technology both within and beyond the school has the potential to provoke transformation in the curriculum, in pedagogy and in assessment by virtue of the increasing importance given to multi-modal communication, and in particular production, in contemporary schooling. Digital technologies can also be incorporated into the school as pedagogic resources, and used in teaching and learning across the curriculum (for instance, in the development of virtual and managed learning environments, the use of digital visual and audio production, the use of the internet to access information and facilitate collaboration). Whilst much of the literature on digital technology and education presents these transformations as necessities (a thinly veiled form of technological determinism), there is marked variation at the level of practice. This is unsurprising because, from studies such as Alexander's, we already understand that the practices of schooling are diverse and are the product of a complex of influences. Digital technology and its associated practices and potentials, inside and outside formal education, are made sense of, and incorporated into and transformed by, systems of schooling in the context of this diversity and complexity.

Studies of the use of digital technology in specific contexts present a predictably varied picture of the realization of this potential in practice. As part of Module 1 of the Second Information Technology in Education Study (SITES M1), a survey of the use of ICT in primary and secondary schools in 26 countries was carried out (Pelgrum & Anderson, 1999). This revealed substantial variation in the extent to which new technology was used in schools, and highlighted differences in access to new technology and variation in teacher knowledge as key factors in this. Module 2 of the study (SITES M2) followed this up by collecting reports on innovative pedagogical practices (locally defined and identified by national expert panels) from each of the participating countries (Kozma, 2003). In her analysis of the resulting 130 case studies, Law states that there is some evidence of a shift towards "more collaborative, student-directed, enquiry-based and productive modes of learning" (Law, 2004, p. 151). This statement is made, however, on the basis of examples of what could be considered by the expert panels to be best practice and thus not necessarily representative of practice more generally. Grouping these cases into six activity types (ranging from innovative scientific investigation and project work, through media production and online courses, to more conventional task-based learning and expository teaching), Law then explores the role played by the teacher and the pedagogic strategies they use.

The picture that emerges is that whilst there is evidence of substantial innovative practice using new technology, in terms of the kinds of activities set, the role of the teacher and the kinds of pedagogic strategies they use are somewhat more conventional. Law observes that whilst innovative practice is almost equally represented in the case studies from the five regions covered by the study (the Americas, Eastern Europe, Western Europe, Southern Africa and Asia), the distribution of innovative pedagogy varies markedly. From this she suggests that whilst the dissemination and transfer of activity types between regions is relatively well established, the transformation of pedagogic practices or teacher roles is somewhat less common and more difficult in practice. These, it could be suggested, are less prone to change as they are tied to both the professional identities of teachers and local pedagogic cultures. The range of what is pedagogically possible in one region, or country, or school, for

instance, in making the transition from predominantly didactic forms of pedagogy to more facilitative approaches, can be very different from another. The next phase of the SITES study (Plomp, Pelgrum & Law, 2007) includes exploration of the factors within and beyond school that might act to shape pedagogical practice and the use of digital technology in the classroom, and the contextual factors amongst these that might dispose teachers and schools to innovative practice.

In wide-ranging and large-scale multinational studies such as SITES, it is difficult to explore the relationship between digital technology, pedagogic practice and the impact on student attainment in any meaningful way (given the diversity of forms of schooling). Some sense of this relationship can be gathered from more detailed and nuanced studies in specific, more limited contexts. Take, for instance, the evaluation of the use of interactive whiteboards in London schools, carried out by Moss and colleagues (2007). Substantial investment has been made in the provision of interactive whiteboards in schools in economically wealthy countries. These enable teachers to develop teaching materials that incorporate multi-modal resources (including image, sound and movement) and to use these interactively with classes of students. Moss and colleagues set out to ascertain the impact of large-scale investment in this particular pedagogic technology across London, focusing particularly on the process of learning and teaching, student and teacher motivation, student behaviour and attendance, and standards of student attainment in core curriculum subjects. In this study, once again, the manner in which the technology is used in teaching is highly variable, with the most innovative practice being most evident in the practice of those leading in the introduction of the technology.

In assessing the potential of this technology to transform pedagogy, the researchers observe that this depends on what the teachers think it is for. They find that teacher thinking about interactive whiteboards revolves around the potential for greater pace of delivery, increased multi-modality of teaching resources and a more interactive form of class teaching. However, the extent to which pedagogic change can be fostered depends on how deeply the technology is integrated into the pedagogic approach adopted and how the facilities offered by the technology relate to established forms of pedagogy in the classroom and the character of the particular subject area being taught. Put simply, speed of delivery, or the use of a variety of forms of representation, may or may not be beneficial in the learning and teaching of particular aspects of particular subjects. The potential of the technology thus relates to the existing pedagogic practices and to the pedagogic cultures and curricular content of the area being learnt and taught. Whatever the perceived potential and observed practice, the research was unable to find evidence of any relationship between student attainment in the core curriculum subjects and increased use of interactive whiteboards in the year of the study.

The point here is that, again, the form of realization of this digital technology in practice relates to the context in which it is embedded. As the technology moves from place to place, its meaning changes. The technology itself is both re-contextualized and re-contextualizing. Kress and colleagues see digital technology as transforming modes of representation and communication and, through this, demanding a transformation in our models of learning and practices of education. In the practice of formal, and informal, education these technologies and their usage are radically contextualized,

and, as international studies such as the SITES studies and more localized studies, such as Moss and colleagues, demonstrate, factors such as the pedagogic culture of a context (at any level from a system to a specific classroom), the skills and understandings of teachers and the expectations of the students act to shape what is possible and lead to a diversity of practices, which conform and diverge in varying degrees from any imagined ideal. There is more to be understood, though, than the dynamics of the contingency of practice. These practices have social consequences and potentials, and to explore these I want to shift attention from one side of the pedagogic relation to the other and to look at the engagement of learners (though a neat distinction between teachers and learners can sometimes be difficult to sustain over time), with a particular interest in the strategies by which differentiation is achieved. I will also shift attention from the physically defined settings of schools and classrooms to virtual pedagogic, and other, settings.

Pedagogic Spaces

Changing modes of communication and representation do not necessarily attenuate the tendency of education to produce and reproduce social and cultural differences in the distribution of attainment and life chances. Gino's (2006) study of visual communication in an economically deprived urban neighbourhood in Israel, for instance, has explored the manner in which children from three culturally diverse groups living in close proximity draw on their distinct cultural histories in making and interpreting images. These children inhabit the same physical neighbourhood, but in their everyday lives have limited opportunities for interaction with children from the other communities. Visual communication, and in particular the making of images to represent aspects of their experience of living in the neighbourhood, can be seen as offering an opportunity to share experiences and perspectives and the creation of a common space and mode of communication that bypasses linguistic differences. However, the cultural differences between the groups give rise, despite working together to construct and share their work, to very different kinds of image, not only at the level of visual conventions, but also in terms of what can be represented.

The move to the visual here could be seen as reinforcing rather than attenuating cultural difference. This raises interesting questions with respect to the potential of computer-mediated multi-modal representation, both in relation to learning to make sense of a diversity of forms of text (where and how might this take place?) and the potential of intercultural communication (to what extent do online communities, with ready-at-hand shared communicative practices and understandings, reinforce divisions constructed and played out in neighbourhoods such as these). Here we have three communities in a tightly bounded physical space with shared common resources and experiences, but whose networks of identification are defined elsewhere and stretch beyond this setting. Online communication offers different possibilities, by virtue, for instance, of its dominant visual conventions, to each group, and both provides the potential to evade, for better or for worse, interaction with other groups prominent in their physical neighbourhood, and to reinforce existing social, cultural and, ultimately, economic differences.

A study of three secondary schools serving distinctly different communities in post-apartheid South Africa by Dowling and Brown (in press) explores the relationship between the characteristics of a community (including the culture and practices of students and parents, and the positioning of schooling and teachers in relation to this community and its aspirations) and pedagogic practices and relations within the schools (including the layout of classrooms, the use of texts, the modes of interaction between students and teachers, and the teaching and learning strategies of teachers and students). How school students position themselves in relation to their immediate locality and community, and how they envisage their future trajectories in relation to these communities clearly has an impact on their orientations to virtual communities and networks.

The school students at a predominantly white school located in a wealthy suburb, for instance, saw themselves as part of a global network and held aspirations that extended across this network (which was consistent with the aspirations and identifications of the school). In contrast students at a predominantly black African township school identified more strongly with their immediate community, but those that sought to leave this community (including teachers who aspired to pursue other careers) saw individual effort, within a supportive community, in formal education as the means to achieve this (Dowling & Brown, in press). Whilst this study does not concern digital technology directly, it does demonstrate the complex relationship between community and pedagogic practice in a way that might lead us to think carefully about assuming that virtual spaces are socially and culturally neutral, and to consider how they might act as contexts for the production and reproduction of social inequalities as do physical pedagogic spaces and practices.

Doherty (2006) provides an illustration and analysis of the complexity of projecting pedagogic practices and attendant assumptions, from one culture to one or more others, by way of an online distance education programme. This study focuses on an MBA unit offered internationally by an Australian university. In designing this online course, care was taken to respect the cultural identities of the participants, and to treat the diversity of experiences and perspectives of the participants as a pedagogic resource, for instance, in setting up small group discussions around the workplace narratives of the members of these, deliberately formed, culturally diverse groups. This in itself presents a paradox that is difficult to manage. Individual members of the groups become privileged informants on, and thus heavily identified with, sets of culturally marked localized practices. This representation of self through the abstraction and re-description (for an international audience) of workplace experience clearly bears the danger of defining individuals and groups in relation to the dominant culture or cultures of the programme. It can also lie in tension with the aspirations of participants who have made a positive commitment to enrol on an 'international' programme as a means of extending or supplementing their cultural identities and gaining access to what they might see as being a potentially valuable international or global discourse.

Other 'troubles' identified by Doherty more predictably revolve around sometimes systemic assumptions of cultural homogeneity, like the ethnocentric default naming conventions in the virtual learning environment, the presumption of knowledge of textual conventions in assessed coursework and the effects of time/space displacement on

provision of feedback to participants. Though Doherty's analysis – and related work on international programmes, such as Singh and Doherty (2004) – goes further than this, the main point to be made here is that online courses in virtual settings are as much party to the play of pedagogic, social and cultural identities as any localized, located and demarcated face-to-face educational programme. Indeed, they may provide particularly fruitful contexts for the further development of the 'sociology of pedagogy' (Singh & Luke in Bernstein, 1996, p. xiii).

Collis (2006), in a collection of papers exploring "the patterns and dynamics of the network society in its policy dimension" (Castells & Cardoso, 2006, p. xix), considers the transformation of education in corporate, professional and higher education settings in the light of the shift to a knowledge economy. She focuses particularly on the potential of e-learning to support productivity in a situation where, citing a New Zealand Ministry of Economic Development statement on the skills needed to sustain contemporary knowledge economies, 'know-why and know-who matters more than know-what' (Collis, 2006, p. 216). Though this clearly echoes a long-standing aspiration of broadly progressive forms of education, Collis observes that much of the practice in e-learning, in which digital technology is used in the management and delivery of education and training, particularly in corporate settings, works in a contrary direction by delivering de-contextualized fragments of knowledge through depersonalized managed learning environments. Collis presents a number of counter-examples in which digital technology, in particular the use of Internet-based resources, online interaction and digital repositories, has and could be used to foster corporate cross-disciplinary knowledge building and sharing, the development of physically remote but mutually supportive professional communities of practice and modes of assessment in higher education that foster reflection, sharing and cumulative knowledge building.

It is notable, however, that once again whilst digital technologies are presented as key drivers of the development of the knowledge economy, the conditions for the appropriate and productive use of digital technology in education are far from in place. The productive use of electronic portfolios in higher education, for instance, is seen as requiring greater institutional investment, flexibility of accreditation bodies, reform of the practices of lecturers and transformation of the expectations of students. As Selwyn (2007) has observed, the gap between the aspirations of advocates of educational technology, like Collis, and the current limited, rigid and constrained usage of digital technology evident in higher education is not easily breeched. The use of digital technology in higher education is, Selwyn argues, shaped by a range of forces at various levels within the system, from governmental concern with global economic competitiveness, through the 'new managerial' concerns of university administration and the commercial interests of the software, hardware and system providers to the experience, interests and concerns of university students. The development of productive engagement with digital technology in formal higher education from this perspective thus requires macro and micro political engagement if the aspirations of educational technologists are to be realized.

Whilst schools and higher education institutions struggle to incorporate creative and flexible uses of digital technology and establish programmes in which the collaborative co-production of knowledge is ostensibly prioritized over transmission, there are

communities of physically dispersed agents, collectively and productively engaged in the co-construction of knowledge, collaborative activity and the sharing of information and strategies thriving, to varying degrees, on the Internet. Most notable are the flourishing informal communities based around shared interests, such as fans of a particular television programme or computer game, or those with an interest in particular technological, cultural or political activities, or shared identities and practices. These communities do not, however, escape the play of cultural and social capital that marks similar endeavours in the 'space of places'.

In a study of Internet fan sites, Whiteman (2006) explores the manner in which authority is established and maintained in online interaction. Far from being open to the free play of positions, perspectives, voices and identities, these sites, though highly productive in the exchange of ideas and information and in the production of commentary on their specialized, and related, areas of interest are highly regulated in and through the contributions made by participants. The strategies deployed by participants act to establish a range of possible legitimate identities and positions mark out who can say what in which settings. The strategies can be viewed as pedagogic in that they act to induct participants into particular modes of engagement and interaction in addition to producing and reproducing knowledge about their chosen area of interest. In conducting the research, Whiteman deploys a broadly comparative strategy in that she looks at two distinctly different sites (though how they might be distinguished beyond surface description is as much a product of the analysis as a starting point). One site, *City of Angels* (COA), is dedicated to the US television series *Angel* and the other site, *Silent Hill Heaven* (SHH), concerns the *Silent Hill* series of videogames.

By analysing postings in a sample of the discussion lists, Whiteman explores how authority and status are established in these fan communities, and the manner in which affinity to particular objects is achieved and regulated. She identifies continuities and discontinuities between the two sites, and is able to explore the different strategies that are deployed by participants in the establishment of an online identity, in claiming authority, in building and regulating a community, and so on. In each case a balance between openness and regulation is achieved in what are ostensibly completely open contexts. Each, however, has its own distinct culture and exhibits the deployment of range of pedagogic strategies through which participants are inducted into appropriate behaviour, and are included, positioned and excluded (Whiteman, 2006). Though not formally constructed as such, these are pedagogic spaces and within these spaces social difference, relations and structures are produced and reproduced.

Digital Divisions

Access to digital technology is clearly not uniform within or between contexts. For those who see digital technologies as a key contemporary educational resource, the differential access to these technologies is a central concern in addressing what is commonly seen as the 'digital divide', with relative wealth or poverty of access clearly discernible between rich and poor communities, regions and countries. Whilst access to these technologies is clearly an important issue, this chapter has attempted

to establish that it is not the only issue in understanding, and addressing, social and cultural inequity in, and beyond, education. The struggle to ensure more equitable access to digital technology has to be accompanied by endeavouring to understand how, through different modes of engagement with and through these technologies, inequalities are (re)produced. Not to do so invokes the danger of the fetishizing of technology, and the pursuit of access as a social project in and of itself.

This is evident in the One Laptop per Child (OLPC) project, initiated by Nicholas Negroponte and other faculty of the Massachusetts Institute of Technology Media Lab. The aim here is to develop a low-cost laptop computer that can be widely distributed to children in both the ‘developed’ and ‘developing’ worlds (see <http://laptop.org>). The laptop and its software have been developed, it is claimed, to exemplify a ‘constructionist’ approach to learning and thus facilitate ‘learning learning’. Though it is claimed that this is an education not a technology project, the development of the laptop, rather than the principles of its use, have been to the fore. This project has not been universally well received. The Government of India, for instance, turned down the offer to participate on the basis that it would divert funds away from more established needs (The Hindu, Tuesday 25th July, 2006). Others have argued that, with even small amounts of money able to make a distinct difference to life chances in desperately poor parts of the world, through, for instance the provision of fresh water and vital medication, this effort is misplaced. Aside from this, the project itself has run into a number of problems relating to the production of the technology to specification and budget and relating to assumptions made about the conditions in which people live, difficulties in meeting the costs of running the machines and the provision and maintenance of basic infrastructure.

The very assumption that the provision of a laptop (or, in this case, a simplified device that bears only limited similarity to a commercial laptop) and selected software (though not, in this case, established business and educational software) will make a substantial contribution to the educational and life prospects of the school students in this vast array of social, economic and cultural circumstances, is itself open to serious question. Even in classrooms in the USA, doubt has been cast by researchers of the value added by giving one-to-one access to laptops. For example, Dunleavy, Dexter and Heinecke (2007), in a study of two middle schools, found that a one-to-one ratio of laptops to students in the classrooms studied did not automatically add value, and suggested that the high cost and the management challenges presented to teachers by the provision of laptops creates a demand for thorough professional development to ensure that teachers are able to create and manage appropriate learning environments.

This does not necessarily mean giving up on digital technology in all but the most economically privileged circumstances (and thus opening the divide further). An alternative strategy is to select and deploy digital technologies in a way that is more carefully attuned to the specific context and circumstances of their use. In the light of the studies cited so far in this chapter, a focus on teacher development would seem to be particularly valuable. Leach and Moon (2002) explore the ways in which digital technologies can be deployed in the education of teachers in wider attempts to reform schooling and to meet national and international objectives, such as universal primary education. They present a number of examples from contexts ranging from poor rural communities in sub-Saharan Africa attempting to rebuild education in the

face of war and disease to urban schools in rich Western countries attempting to provide for increasingly linguistically, culturally and economically diverse populations. In all cases, the creation and maintenance of a sufficiently large teaching force with appropriate knowledge and professional skills are seen as key challenges, which digital technologies and new approaches to teacher education can help to meet.

The strength of the approach proposed and of the examples given is the contextual sensitivity and appropriateness of the interventions. In many cases conventional forms of teacher education are themselves not feasible, given the scale of the enterprise and the levels of resources available. In these settings, the use of communications technologies to facilitate teacher learning and networking can enlarge the possibilities for teacher development far beyond the conventional investment in buildings and other physical facilities that concentrate resources in one area thus creating distance between professional development activities and the context of their eventual realization.

The Digital Education Enhancement Project (DEEP) is one such research and development project which focuses on the use of digital technologies in fostering the development of the pedagogic knowledge and practice of teachers, and exploring the impact of technology enhanced strategies on the motivation and achievement of school students, in 12 schools in the city of Cairo in Egypt and 12 schools in towns and rural areas of the Eastern Cape Province in South Africa. As part of this, Leach and Moon (2004) explored the use of handheld computers by teachers in this project, finding that these small, portable, flexible and easy to use devices became easily integrated into teachers' daily workflow and had a substantial impact on teacher professionalism, organization and planning, collaboration and shared learning, the development of new classroom practices and the self-esteem of teachers. Studies such as this give some indication of the potential of new technologies in teacher education and development. It should be clear, though, that the outcomes are not a function of the technology but of its interaction with contextual factors in the setting within which the technologies and their related practices are embedded. This means not only that care has to be taken in assuming that these technologies/practice can be transferred elsewhere to similar effect, but that the perceived effectiveness of the intervention itself is likely to be transitory as, for instance, the technology takes on new social and cultural meanings over time, and as other conditions change.

Conclusion

Digital technologies are viewed as enabling rapid communication across distances. They enable the production and distribution of information and digital artifacts, in the form of text, graphics, sound and video. As these artifacts move from one place to another, whilst their form might remain stable (or might not), their meaning, potentially, transforms as they shift from one system of signification to another, and as they are read and reread by different agents bringing different meanings and understandings to their interpretation. This is nothing new, and indeed is the stuff of that strand of academic comparative education which attempts to understand the relationship between systems and practices through addressing, for instance, the borrowings, transfers and translations between one system and another. So practices associated with child-centred

education in England, such as the public display of individual children's work as a way of celebrating individual achievement and encouraging collective endeavour, come to mean something very different when transferred to the classrooms of rural Indonesia. This re-contextualization constitutes a transformation as practices are plucked from one network of meaning, or culture, and replaced in another.

Viewed in this way, these practices cannot be understood as having a given essential meaning, but rather can only be understood in relation to the context of their realization. The movement of digital artifacts from one context to another can also be understood in the same way. The spaces through and in which they travel are, however, virtual as well as geographical (and the 'and' here is of central importance). It is not just the digital texts and artefacts, though, which meet this fate; it is also the digital technologies themselves.

The emphasis in this chapter has been on understanding digital technologies and their educational usage, both formal and informal, in relation to the contexts in which they are embedded. These contexts can themselves be embedded in other contexts. Individual schools, for instance, are embedded in particular groupings (defined, for example, by the ages of the school students, modes of funding, geo-political location and so on) within particular systems of education (defined, for example, in terms of nation or region or trans-national network of interlinked or associated institutions and so on). Each higher level of organization acts to provide a reservoir of meaning potential for its constituent parts, which in turn, through the realization of this higher level as a repertoire of instances, enables us to describe, understand and explain its characteristics. Classrooms thus have to be understood in relation to the systems in which they operate, and in turn act to constitute the system as instances of it. This relationship operates at any level from individual action to trans-global systems.

The formal and informal pedagogic spaces that have been considered in this chapter are clearly not socially neutral. Just like any material setting or community, virtual settings and communities are marked by the play of social and cultural capital, and through this patterns of social relations are produced and reproduced. Whilst the shift from reproduction of knowledge and artifacts to production and dissemination that is facilitated by digital technology can be seen as potentially subverting formal educational institutions, in practice existing patterns of social and cultural relations and their associated practices act against this. The perceived need, for instance, to train teachers and students to use specialized technologies in particular ways is one example. This inverts the notion of transformation of education by new technologies by reading these technologies as requiring new competences, of teachers and students, which must be acquired before they can be used effectively in pedagogic settings. This creates potential deficits and patterns of distribution of competence, and thus inclusion and exclusion and success and failure in the use of technology in particular sanctioned ways.

Increasingly, the technologies themselves are already part of the everyday experiences of students and teachers. These technologies are not, however, equally part of the everyday lives of all students (and so the degree of resonance between the culture, practices and common competences of, for instance, the home and the school will vary), nor are the material and symbolic resources (such as teacher knowledge and expertise) to be able to incorporate them into the curriculum equally available to all

schools. Even if they were, the relationship between the cultures of the children and the cultures of the school would be different. The framing of the 'digital divide' as being predominantly about access to appropriate hardware and software fails to address this. The OECD study carried out in 23 countries by Venezky and Davis (2002) noted that schools were clearly aware of the potential inequalities that the use of digital technologies in schooling might cause, but the strategies to overcome this that they cite relate only to helping low-income families to gain access to these technologies. The report notes that few schools had data to enable them to monitor differences relating to gender, income or achievement.

None of these are determining relationships, but involve potential and meaning, and thus, of course, entail facilitation and constraint. Much of the discussion of the relationship between education and digital technology within and between contexts confuses potential with practice and possibility with necessity. Consideration of digital technology from a comparative perspective, which acknowledges the social embeddedness of the phenomena with which it engages and seeks to understand what happens as entities move or are manifest in different contexts, can help us to avoid, or at least mitigate, these confusions and connotations. The disembedding, or rather re-contextualizing, potential of digital technologies also presents a challenge to comparative education in questioning the utility of the boundaries constructed around contexts (for instance, around national systems) and, indeed, constitutes a challenge to the very notion of a boundary as elements from one context are projected into (and read and reread) in others. Methodologically and conceptually, engagement with the uses of digital technology in formal and informal educational settings provides an opportunity for the enlargement and further development of the productivity of a comparative approach, both academic and applied.

RETHINKING CONTEXT IN COMPARATIVE EDUCATION

Michael Crossley

Concern with context penetrates to the heart of comparative education. It is reflected in much of the early writing within the field, and it remains central to many contemporary intellectual positionings, discourses and developments. Contextual issues are also central to many of the most passionate theoretical and methodological debates that are to be found in the research literature – past and present. Thus questions of context reveal much about the history of comparative education, at the same time as they inspire and shape some of the most challenging research and scholarship at the cutting edge of the field today.

This chapter explores the nature and implications of such debates, and of the contextual themes that play a strategic role in shaping the future of some of the most innovative approaches to comparative and international education worldwide. This is done with reference to developments that have made a significant contribution to the evolution of research in comparative education, and to my own related work within this multi-disciplinary field.

Historical Reflections and Paradigmatic Tensions

Tensions between positivistic forms of comparative research in education seeking generalisable laws and predictions, and more hermeneutic/interpretive perspectives developed to generate insights and improved understanding, can be traced back to the intellectual foundations of comparative education as a specialist field of enquiry. While details of this history can be readily found elsewhere (Brickman, 1960, 1966; Wilson, 1994; Crossley & Watson, 2003), the implications of related paradigmatic debates for contemporary innovation and creativity in both theory and methodology repay careful reconsideration.

The seminal influence of Marc-Antoine Jullien's "plan" for comparative education in the Parisien intellectual climate of 1817, for example, established the positivistic foundations of the field with efforts "to deduce true principles and determined routes so that education would be transformed into an almost positivist science" (cited in Fraser, 1964, p. 20). For many Western writers Jullien is seen as the founding "father" of systematic research in what was, then, a new field. Jullien's influence is alive and well today where it is reflected in the efforts of international agencies, such as UNESCO and the Organisation for Economic Cooperation and Development

(OECD), to produce annual collections of international education statistics to facilitate global comparisons. It is also visible in the work of bodies such as the International Association for the Evaluation of Educational Achievement (IEA) that has pioneered cross-national achievement tests and the construction of international league tables (Postlethwaite, 1999) – and in the OECDs own influential Programme for International Student Assessment (PISA) surveys (OECD, 2004).

While there is much that can be learned from the current enthusiasm for cross-cultural achievement studies, attention also needs to be given to their limitations and to the dangers of their misuse – be it unintended or not. Finland, for example, has consistently done well in cross-national league tables, while South Africa has experienced disappointing results. The visibility of such rankings can inform and inspire qualitative improvements, but it can also prove to be damaging and unhelpful, as argued by Reddy (2005) in the South African context – and, perhaps more surprisingly, as Simola (2005) points out for Finland. What unites these two very different cases is attention to the limitations of large-scale comparative surveys in taking adequate account of the influence of contextual and cultural differences. Reddy (2005, p. 76) for example, argues that the potential benefits of cross-national achievement studies will only be realised in South Africa if:

participating countries contribute more towards the shaping of such studies to meet their own needs. The power relations inherent in cross-national research also deserve greater recognition, and mechanisms need to be set in place to help diminish these differentials. Information derived from multi-country studies needs more careful analyses if it is to be relevant to specific local contexts ... and it is also important for the culture of the international organisations that promote and coordinate such work to change so that they can better accommodate the implications of different experiences and contexts.

Secondly, as Simola (2005) demonstrates, distinctive pedagogic assumptions and values are embedded deep within cross-national achievement tests, and, somewhat ironically, these often prioritise formalistic forms of teaching and learning that many educational decision-makers and stakeholders claim to be challenging for being inappropriate for the demands of the twenty-first century. Issues of context thus loom large if we are to better understand the dilemmas that are associated with cross-national achievement testing, the use of league tables and the dangers of their “backwash” effect (see also Dore, 1976 and Little, 1997) upon pedagogic and professional cultures in education worldwide.

Returning to the historical and epistemological foundations of such debates, it can be seen how concern for context also underpins one of the central questions faced by comparativists in many fields and disciplines – that is, how can we best learn from experience elsewhere? It was such questions that inspired challenges to Jullien’s positivistic foundations for the field, and to nineteenth-century preoccupations with the international transfer or “borrowing” of educational policy and practice (Phillips & Ochs, 2004; Phillips & Schweisfurth, 2006). Michael Sadler’s widely acknowledged influence upon the emerging field of comparative education at the outset of the twentieth century clearly reflected a challenge to such positivistic assumptions, and represented a socio-political re-positioning that both recognised the dangers of the

uncritical international transfer of policies and practices, and highlighted the significance of context and culture in the development of education systems (Sadler, 1900; Higginson, 1979; Sislian, 2003). In subsequent years leading comparativists such as Isaac Kandel (1933), Nicholas Hans (1964), Vernon Mallison (1975) and Edmund King (1979a) developed and applied their own distinctive approaches to comparative research, consistent with the spirit of Sadler's influence and the interpretive-hermeneutic paradigm. By the 1960s, however, a resurgence of "scientific" approaches to research in the social sciences was evident in the Western literature. This favoured quantifiable data that offered the prospect of law-like generalisations and the possibility of more robust educational planning and social engineering. Positivistic aspirations were thus refashioned in the form of post-war contributions seeking to advance the "science" of comparative education. Noah and Eckstein (1969) are well known for pursuing such work in the United States, while in the United Kingdom, Holmes (1965, 1981) sought to advance the scientific model by promoting what he called the "problem approach" to social science and comparative education.

Interpretive and hermeneutic traditions, nevertheless, remained influential with many comparativists, championed by writers such as Grant (1977), King (1989) and Kazamias (2001). By the 1970s renewed rigour and enthusiasm were also stimulated by advances in the "new sociology of education", critical theory and qualitative approaches to research in the social sciences. Stenhouse's (1979) Presidential Address for the then UK Branch of the Comparative Education Society in Europe (CESE) characteristically advocated greater attention to case study informed by detailed qualitative fieldwork (see also Crossley & Vulliamy, 1984/2006). At the time, this was seen to challenge current practice and pre-occupations with policy, by opening up new units for analysis at the micro level, and focusing the attention of researchers more firmly upon observed practice and the lived experience of research subjects. For many observers this was seen to exemplify:

the change which has taken place since the 1960s in all aspects of social study (including the study of education). "Phenomenological" or "locally significant" dimensions of the educational scene are now given more attention in terms which the prime participants would use. (King, 1979b, p. 1)

My own work contributed to such developments by arguing for greater attention to be paid to local professional contexts in developing countries, as a way of challenging the uncritical international transfer of curriculum reform strategies (Crossley, 1984). New "voices" were thus increasingly being heard and, in combination with the influence of critical theory, the politics of different discourses was increasingly recognised at all levels of the research process. Masemann's work on critical ethnography (1982) illustrates this well, and her CIES Presidential Address on "Ways of Knowing" (Masemann, 1990) drew direct attention to the significance of contextual issues in epistemological debates concerned with the nature, characteristics and quality of comparative education. More could be said, but while it is not the intention to rehearse the details of this history here, it is useful to observe how what came to be called the "paradigm wars" inspired further methodological advances that both reflected and contributed to major theoretical developments across the social sciences. A related overview of

such historical trends and their influence on comparative education is also provided elsewhere (see Crossley *et al.*, 2007). More pertinently for the present analysis, these are all developments that in large part wrestled (and still do) with the place of context in both theoretically and empirically orientated research and scholarship. It is to the nature and significance of more recent intellectual developments, to the centrality of context in such processes, and to their implications for the future of comparative and international research in education that we now turn.

Reflections and Reworkings: Rethinking the Place of Context in Comparative Research in Education

While tensions between positivistic and interpretive forms of comparative education continue to influence the research landscape to the present day, the impact of critical theory, postmodern perspectives and other related epistemological and theoretical positionings has been profound. Recent decades have experienced dramatic paradigmatic challenges and innovative “re-imaginings” for comparative education, as growth in the research profile of the field has been spurred on by the intensification and impact of globalisation worldwide (Crossley & Watson, 2003; Dale & Robertson, 2005).

This history may seem to be familiar territory for some readers, but by taking a different view of events, the main thrust of this chapter is to argue that it is contextual factors and increased awareness of their significance in both educational research and educational change, that underpin many of the most significant developments of current times. This, in turn, points to the very real potential of comparative research in education to contribute to increased understanding of such issues, by drawing upon the field’s wealth of directly relevant experience. This can now be illustrated by revisiting and reflecting upon selected paradigmatic shifts, and future possibilities, in greater detail from this explicitly contextual perspective.

Perhaps, most obviously, it can be seen how qualitative researchers such as Stenhouse and Masemann played a significant role in shifting the focus of comparativist’s attention away from a concentration upon both the nation-state context and the analysis of policy at the macro level. Contributions to Crossley and Vulliamy’s (1997) volume illustrate this well with reference to studies of education and international development that employ ethnographic, case study and other research strategies that access the micro-level contexts of schools and communities throughout the South. While such studies, and influential European research by Broodfoot, Osborn and colleagues (1993, 2000, 2003), often combined local level context sensitivity with broader social and political analyses, Bray and Thomas (1995) made a further contribution by highlighting the importance of multi-level analysis through the construction of a helpful three dimensional theoretical model. In this model:

The authors observed that much research remained at a single level, thereby neglecting recognition of the ways in which patterns at the lower levels in education systems are shaped by patterns at higher levels and vice versa. (Bray, Adamson, & Mason, 2007, p. 8)

Again, however, Bray and Thomas were advocating the juxtaposition and comparison of different levels of context.

In a related series of developments, efforts to better understand local perspectives and the voices and needs of practitioners helped to inspire the application of action research and practitioner researcher strategies in comparative investigations – so reducing the extent of the gap between the researcher and the researched. Stuart, Morojele and Lefoka's (1997) study of classroom practice in Lesotho demonstrates the potential of such forms of action research, and Choksi and Dyer's (1997) reflections on their collaborative research in India draw attention to the benefits to be gained from context-sensitivity generated through North–South collaboration. Influenced by writers such as Freire (1971, 1982), Chambers (1994) and Kemmis (1997) the potential contribution of participatory and practitioner approaches to comparative and international research has become increasingly recognised by the academy as well as by governments, development agencies and funding bodies. This has further stimulated the generation of a variety of innovative models that include Participatory Rural Appraisal (PRA) (Chambers, 1994; 1995) and participatory action research (Selner, 1997). Participatory approaches to research have thus become increasingly acknowledged for what they can contribute to educational development and community empowerment in context.

Similarly, much of the rationale for the application of postcolonial perspectives (Hickling-Hudson, 1998; Hickling-Hudson, Mathews & Woods, 2003) draws upon:

an interpretive approach blending history and epistemology in specified locations [that] is useful in showing how interwoven is the postcolonial present with the colonial past. (Hickling-Hudson, 1998, p. 328)

Here concern is given to understanding the world from the perspective of the South, the formerly colonised, the marginalised, from their own distinctive vantage points – and informed by their own political and contextual sensitivities. Not surprisingly, critical theory often informs such comparative research (Burns & Welch, 1992; Apple, 1993; Rizvi, 2004), inspired by a commitment to ensure that research plays a part in challenging unequal power relations and in influencing the nature and direction of change (Foucault, 1972; Habermas, 1978; Apple, 2001). A special issue of the journal *Comparative Education* (Crossley & Tikly, 2004) explores such postcolonial possibilities for comparative and international research in education, reflecting upon this in the light of a related critique of postmodern influences upon educational research.

Where both postcolonialism and postmodernism have much in common is in their critique of globally orientated meta-theory and the assumptions of enlightenment science, along with their celebration of diversity, difference and context. To cite Gadamer “all knowledge reflects the socio-historical contexts of its production” (cited in Hammersley, 1995, p. 14). By drawing attention to the political and intellectual contexts of knowledge production and legitimation, researchers thus began to focus upon the deconstruction of dominant world views and to explore the relationship between politics, knowledge and power. According to Cowen (1996a, b) such advances came late to the field of comparative education though there is now much work within the contemporary literature to suggest that these influences are increasingly significant – if

somewhat indirect and marginalised from policy-making arenas. This need not be so, however, as demonstrated by the edited collection by Ninnes and Mehta (2004) titled *Re-Imagining Comparative Education: Post foundational Ideas and Applications for Critical Times*; and work in progress, by Larsen and Mehta (forthcoming), exploring the impact on education of the insecurities that have been generated in North America by the events of September 2001. For present purposes, however, it is the contextual sensitivities that engage with the philosophical foundations of post-modernist, post-colonial and post-structuralist thinking that are seen to have much to offer comparativists, and it is selected research initiatives that capture elements of such potential that are the focus of the next sections.

Changing Research Contexts, Emergent Trends and New Possibilities

Despite the many and varied paradigmatic advances of recent decades the global research context is currently one in which positivistic conceptions of the social sciences are once again prioritised in many quarters. In the UK and United States, for example, neo-liberal ideologies, combined with the interests of the state and managerialist principles have had a powerful impact upon the nature and focus of research environments and processes (St.Clair & Belzer, 2007). Sustained critiques of social and educational research have argued that too much work lacks a coherent body of theory, is neither authoritative nor cumulative enough, and is often unhelpful for policy and practice (Hargreaves, 1996; Kennedy, 1997; Hillage, 1998; Tooley & Darby, 1998). In responding to this, policy-makers, research funders and other powerful stakeholders have engaged with what Furlong (2004) refers to as the “big science” approach to research-based evidence. This many see as silencing other approaches, most notably those qualitative strategies that have contributed most to the study of practice in context. Vulliamy (2004) challenges the global impact of such trends with direct reference to their implications for comparative education in his 2003 Presidential Address for the British Association for International and Comparative Education (BAICE). In doing so he points out how comparative researchers must now contend with:

growing international interest in systematic review methodology and its associated privileging of quantitative research strategies, such as randomised controlled trials, in evidence-based policy. (Vulliamy, 2004, p. 261)

This is the intellectual and professional context in which many in the educational research community – including comparativists – must now work. It is in the light of this that possible ways forward are now considered, arguing along with Furlong (2004, p. 343), that:

we need to defend a rich and diverse range of approaches to research, promoting debate about quality within different sub-communities and encouraging open discussion across epistemological and methodological boundaries.

Indeed, it is also argued that this is even more important in the arenas of cross-cultural, international and comparative research – where differences in world views add significantly to the complexities, and ethical, political and contextual implications (Hayhoe & Pan, 2001). In exploring possible ways forward the chapter now draws upon examples of innovative comparative research, along with aspects of my own work, that it is suggested hold potential for future trajectories in context-sensitive comparative and international research in education.

In looking to the future, reference is initially made to two related arguments that help to draw a number of contextual themes together. Firstly, this revisits my own concerns to “reconceptualise” comparative and international research in education in ways that more effectively acknowledge the potential and limitations of different approaches to, and modes of, comparative education (Crossley, 1999). Secondly, this argument is developed along with efforts to encourage an increased “bridging of cultures and traditions” (Crossley, 2000; Crossley & Watson, 2003) within the field and between, for example, paradigmatic and disciplinary positions, theoretical and applied studies, policy and practice, micro, macro and other levels of analysis, the humanities and the social sciences, studies of the past and the present and research in the North and the South. It is argued that such efforts could do much to help to address many of the challenges raised about the impact, authority and accessibility of educational and social research that are noted above – and that this is possible even in contexts experiencing the difficulties and dilemmas generated by problematic changes in the broader research environment.

Moreover, while this bridging process may encourage a blurring of boundaries between constituencies, paradigms and personnel, this should not be seen as equating in any way to an intellectual or professional compromise or bland search for consensus. Rather, as argued elsewhere (Crossley & Watson, 2003), it prioritises and values the ongoing creativity and originality that the juxtaposition of different world views may generate – and, most pertinently here, improved awareness of the implications of cultural and contextual differences. This “bridging” thesis therefore celebrates and values difference – and the potential of different comparative educations – and applies comparative perspectives and processes to generate new creativity. Bakhtin’s understanding of such processes is helpful in this respect when he suggests that:

A meaning only reveals its depths once it has encountered and come into contact with another, foreign meaning. ... We raise new questions for a foreign culture, ones that it did not raise itself; we see answers to our questions in it; and the foreign culture responds to us by revealing to us its new aspects and new semantic depths ... such a dialogic encounter of two cultures does not result in merging or mixing. Each retains its own unity and open totality, but they are mutually enriched. (Bakhtin, 1986, p. 7)

In the light of this conceptual and theoretical positioning, much can be gained from examples of ways in which recent comparative studies have been developed around international collaborations between Northern and Southern research teams, while

linking theoretical scholarship with studies designed to inform policy and practice in context. Three such research projects stemming from my own work over the last decade were carried out in collaboration with colleagues at the Universities of Bristol and Bath, and personnel working within universities, colleges and ministries of education in Belize, Kenya, Rwanda and Tanzania.

The first study (1994–1999) was designed to document the nature and quality of teaching and learning in Belizean primary schools – and to help evaluate the impact, in practice, of the DFID funded Belize Primary Education Development Project (BPEDP) (Crossley & Bennett, 1997). The second two-phase study consisted of the formative and summative evaluation of the implementation of the Primary School Management Project (PRISM), designed to train head teachers in leadership skills in Kenya (1996–2000). This was combined with a reflective and historically situated analysis (2001–2005) of the theoretical foundations of the project and its associated research and evaluation strategies (Crossley *et al.*, 2005). The third study (2000–2002) examined the implications of globalisation for education and training policies in Rwanda and Tanzania (Tikly *et al.*, 2003).

For present purposes these initiatives can be seen to build cumulatively upon each other. While each had a different substantive focus, all were funded by the UK Department for International Development (DFID) and all prioritised improved stakeholder partnerships and process goals designed to contribute to the strengthening of research and evaluation capacity within the South. From the outset, this was seen to include ways of improving the context-sensitivity, and cross-cultural research skills and experience of all involved – including the Northern partners.

The substantive findings of each specific study can be read elsewhere, but it can be seen how they collectively demonstrate different dimensions of the bridging thesis in practice. It is therefore the process goals and associated research strategies that are most illuminating for present purposes. In all three cases the research was carried out by international teams of researchers – emphasising long-term collaboration between organisations and personnel in both the North and the South. This had the advantage of combining insiders familiar with the cultural contexts involved, with outsiders who can bring fresh and challenging perspectives – a strategy much commended in the international literature (Spindler & Spindler, 1982). In the Belizean and Kenyan studies emphasis was also placed on involving practitioners in forms of participatory or action research and evaluation. This is consistent with Delanty's (1997) proposal for social research to be conceptualised as 'discursive practice', whereby problems are democratically identified, defined and examined. In a related vein, Chambers, an advocate of participatory research in development work, calls for the researcher's role to be transformed in similar ways so that:

[f]rom planning, issuing orders, transferring technology and supervising, they shift to convening, facilitating, searching for what people need and supporting. From being teachers they become facilitators of learning. (Chambers, 1994, p. 34)

In these three studies bridges were thus built between the North and the South, between researchers, policy-makers and practitioners, and between insiders and outsiders. In

addition, all three studies were multidisciplinary in nature, provided research training that bridged paradigmatic boundaries, incorporated macro and micro levels of analysis and located contemporary policy critique within a thoroughly researched historical framework. Finally, each of these studies usefully illustrates the possibilities and dilemmas that are encountered when efforts are made to investigate development issues with increased sensitivity to what Arnove and Torres (2003) call the “dialectic of the global and the local”. In this respect we can see how these initiatives, designed partly to help strengthen local research and evaluation capacity, are firmly grounded in perspectives that are at the heart of disciplined and context sensitive comparative and international research.

Today the influence and potential of such collaborative approaches to research are being explored further in the form of a new DFID funded Research Programme Consortium (RPC) led by Leon Tikly, Angeline Barrett and colleagues (www.edqual.org/). This focuses upon studies designed to help improve the quality of education in low income countries, and the mode of operation continues to foreground long-term, international partnerships and research capacity strengthening (Crossley, 2006).

A second area where an increased focus upon context holds considerable potential for future comparative research relates to the work of a parallel DIFD-funded RPC focused upon access to education (www.create-rpc.org), and to the earlier discussion of cross-national achievement studies and associated league tables. In a recent BAICE Presidential Address, Lewin (forthcoming) draws upon the initial work of the Sussex-led RPC on “Access to Education for All” and demonstrates how improved understanding of such issues can be gained from innovative uses of statistical data sets in ways that draw attention to, rather than mask, local variations and contextual differences. To quote Lewin’s (forthcoming) concluding remarks:

[A]s the EFA processes have unfolded, at least in the poorest countries and those most dependent on external assistance, convergence in diagnosis and prescription has overshadowed more and more divergence in context and patterns of exclusion. If this persists it is at least arguable that progress will be hampered by homogenised goals and targets applied without much contextual grounding or dynamic relationship to changing circumstances.

Indeed, by paying close attention to context, this statistically oriented research helps to indicate how quantitative and qualitative research can make complementary contributions that have important potential for policy critique and development, and for the advancement of theory – in this case relating to school access and retention, and to the pursuit of the Millennium Development Goals.

Similarly, the critique of cross-national achievement tests, the use of league tables (of all types and in all sectors of society), and target setting, deserves increased attention from the comparative social sciences – ideally incorporating mixed method (Osborn, 2004) collaborations between quantitative researchers and qualitative personnel attuned to contextual implications. Goldstein (2004, p. 13), for example, draws upon a distinguished career in statistical methods but engages with comparative critique and context sensitivities in a most challenging way when he argues that organisations such as UNESCO should challenge their:

current orientation ... which appears to derive from official philosophies of target setting and centrally determined “benchmarks” which have prevailed within certain parts of the Anglophone world since at least the mid 1980s. Nevertheless, from the perspective of those countries identified as likely to fail to meet current targets, a locally contextualised perspective would seem to offer more potential for improvement. It is, after all, just those countries that are in most need of help.

In reflecting upon the significance and impact of the IEA studies, Goldstein (1996, p. 126) holds similar sentiments, calling for more careful and insightful studies of test procedures, conclusions and implications and noting that:

when educational systems have different aims and curricula, interpretations of student performance need to be related to such different contexts.

A third and final group of examples of innovative context-sensitive research can be drawn from recent advances in the application of narrative research to comparative studies. Trahar’s (2006) edited volume is one of the first books to explicitly address such combinations, and the individual chapters make a valuable contribution to the methodological debate, at the same time as they point to future possibilities. As Hayhoe (2006, p. 9) argues in her Foreword to this volume ... through narrative research:

people in different contexts share their thoughts and experiences about educational changes brought about through globalisation, and contribute to the reconceptualisation of comparative research and notions of internationalisation in ways that reflect their distinctive geopolitical locations.

Narrative approaches can thus build most effectively upon other qualitative traditions that have already played a part in advancing interpretive and hermetic research, but it can also help to bridge such work with theoretical perspectives such as postcolonialism (Fox, 2006), and arts-based investigations in which story, poetry and other forms of representation are used to understand context (see Holmes & Crossley, 2004). Bainton (2007), for example, has recently completed doctoral research that developed a “critical narrative” approach to explore the impact of Western education on indigenous knowledge in the Indian Himalayan region of Ladakh. In this highly innovative study the researcher prioritised post-structural and narrative approaches, combined with Buddhist philosophy, in order to interrogate the livelihood practices and educational experiences of rural communities in Ladakh. Here, his own experience living and interacting with local farmers, sculptors, poets, priests and families, was the well-spring for policy critique and theoretical insights where:

[t]he productive tensions between the different aspects of the critical narrative approach allows for a tentative comparative analysis of possible counter hegemonic knowledge production. In this regard, Buddhist philosophy, as a form of “indigenous theory” is seen to offer new forms of critique while at the same time giving a hopeful reading of the possibility of human agency. (Bainton, 2007, p. i)

In such research, the analysis of uncritical international transfer is central, and context is both the focus and the methodology – context is the heart of the study itself.

Conclusions

Rethinking the place of context in comparative education, it is suggested, has much to offer all engaged in both educational research and educational development. Indeed, as Schriewer (2006a) has shown a “culturalist” approach can be identified within comparative studies across the social sciences and has long “been geared towards examining phenomena not in disjointed isolation but in terms of their historical affiliation *to*, and dependence *on*, more encompassing societal and cultural contextual conditions” (Schriewer, 2006b, p. 1). Implications of the present analysis, in turn, hold potential for future research trajectories in many fields and disciplines across the social sciences. The year 2002, for example, saw the American Sociological Association launch a new journal simply titled *Contexts*, designed to take “sociological research out of its ivory tower and into a real world perspective” (ASA, *Contexts* Brochure). In the realm of psychology, innovative and challenging advances by Rogoff (1990), Wertsch (1995) and Elliott and Grigorenko (2007) reflect many comparative principles, by demonstrating how sociocultural theory understands individual, personal growth as shaped by the cultural and social contexts in which it occurs. Similarly, in exploring future directions for global economic development, the BBC Reith Lectures delivered by Jeffrey Sachs in 2007, also locate increased contextual sensitivity at the heart of future international policy deliberations designed to reduce poverty, tackle climate change and prevent war (Sachs, 2007). Returning to the field of comparative education, Stromquist prioritises similar concerns for international equality and equity with implications for improved linkages between stakeholders and constituencies. She argues that the influence of comparative and international education:

is determined not only by its intellectual value but also by the proximity of its practitioners to the circles of power. Those wielding influence are not academics but rather the staff members of international organisations and their transnational counterparts who subscribe to dominant, market-oriented development models that are not substantiated by empirical research. (Stromquist, 2005, p. 107)

The future for comparative and international research across the social sciences will therefore be exciting, challenging and increasingly engaged with the nature, role and impact of context.

In this chapter new ways of exploring the significance and implications of context have been explored, in the light of its long acknowledged place in research and scholarship in this multi-disciplinary field. It is argued that further revisiting and rethinking of such implications could make a significant contribution to the future of comparative and international research in education. Vulliamy (2004), nevertheless, returns to the paradigmatic issues discussed at the outset of this chapter and warns that:

A concern for sensitivity to cultural context has been a key part of the field of comparative education in England – all the way from its pioneers ... to current exponents ... Such a concern for cultural context also pervades sociological traditions underpinning the development of qualitative research ... The challenge for future comparative and international researchers in education is to harness the symbiosis of these two traditions to resist the increasing hegemony of a positivist global discourse of educational research and policy-making. This global discourse threatens to undermine the findings and analyses of comparative education research by either completely disregarding cultural context or relegating culture merely to existing as an extraneous variable to be statistically analysed.

It is hoped that the critical reflections presented here help others to challenge the uncritical international transfer of educational and social research paradigms and policies, that they contribute in some way to future directions for comparative education, and that they help to demonstrate the extent to which “context matters” more than is often realised, not only by policy-makers, but also by many researchers working in education and across the social sciences.

BIG STORIES, SMALL STORIES: BEYOND DISPUTATIOUS THEORY TOWARDS 'MULTILOGUE'

Sonia Mehta

Dedicated to Rolland G. Paulston

That there was a time when a war could be waged between 'relativists', who claim that language refers only to itself, and 'realists', who claim that language may occasionally correspond to a true state of affairs, will appear to our descendants as strange as the idea of a fight over sacred relics.

Latour, B. (1999)

By Way of Introduction: A Small Story

As an 'international' student of comparative education, I entered the field of comparative international education, bringing with me a very different academic tradition and cultural history. I saw the field as a *darbar* (or 'King's court', in Hindi) of theories, presided over by an organizational structure that positioned it within a certain range of disciplinary academic frameworks. This disciplinary lexicon was further disciplined by professorial choice of syllabi. This was a powerful court, and its arguments were familiar, if distant. I made haste to learn its language. I paid attention to the glittering promises of the largest stories: the upliftment of all humankind, and the promise of progress. I wore these as mantels in my own grand design of scholarship. Inevitably, I was disenchanted: there appeared no way to articulate the different and separate (and to me, precious) sets of stories I carried around with me like a secret. There was a reason I had come into the field with my own small stories, thinking they meant something in a larger canvas, and I was not alone: other students came with other small stories. I found my stories becoming more obscure, as language failed them and socio-educational practice left them on a distant margin. There was no advocacy for them in the *darbar* of comparative education studies, more out of neglect and insularity rather than specific malignancy. My stories, and those of some of my fellow students, were simply unimportant, less immediate or translated and changed as they slowly became grafted onto more powerful research options in more powerful and pervasive educational discourses. Mine was only one small story, and this problem was only a nebulous one in the larger scheme of educational problems, but it led me to consider this curious placing of stories in an educational and social, and intimately human context. I have

two dear friends to thank for their wisdom in helping me escape this effacement of self, and the compression of teeming human variety into stifling binary logic. Peter Ninnes and Rolland Paulston, with their separate approaches to scholarship and their immense humanity, compassion and vision showed me a fluid and malleable landscape of understanding and another possible reality for myself and for what I do through education.

Disputatious Times in a Disputatious Field

This essay-in-understanding is situated in the context of comparative education studies in Anglo-America. I begin by tracing some of the scholarship done in the field that begins to open the way for new and different ways of doing comparative education research, while at the same time marking the upheaval this has caused within its scholarship. Comparative education has been struggling with its own stories. The field of comparative education has been seen as diverse and eclectic (Laska, 1973; Paulston, 1994), the selected expression of knowledge in a field of immense possibilities (Schriewer, 2000). Modernism has been long seen to dominate the field, but the field is also seen to be moving towards ideologies that are other than modern (Paulston, 1999; Rust, 1991; Kelly, 1992; Welch & Masemann, 1997; Cowen, 1996, 2000). There have been various interrogations of what is excluded from the histories of comparative education and its origin stories, and concern for excluded narratives (Cowen, 1996, 2000; Ninnes, 2002). Cowen, revisiting a comparative education preoccupation with identity and ‘early ideologies’, suggests a reflexive and critical look at the literature, and in so doing, points out an implied critical value of all “small stories”:

(If) a good comparative education would combine an understanding of the intersection of the forces of history, social structures and individual biography, then it is crucial to absorb the theme of personal identities into our literature. ...[A]ny reading of the contemporary world in terms of the scale of diasporas and migration suggests that comparative education is now too separated from a literature about ‘the other’ which it helped to pioneer. (Cowen, 2000, p. 336)

Masemann, in 1990, wrote “It is quite likely that the spread of linear fragmentary forms of education as we now know them will be slowed or halted”, “in a world that can value diversity” (Masemann, 1990, p. 473). She also advocated “looking beyond what might be an adaptive form of response ... where the ‘sacred knowledge’ is being generated by academics and researchers” (1990, p. 469). Masemann, Cowen and others, in my reading, are among those advocating alternative ways of thinking about education in a diverse world, and are implying that there is a need for non-linear, connective forms of education which can address the world of diversity we now engage with. The influx, however small, of postcolonial and postmodern ideas, largely due to the search for more relevant and inclusive ways of thinking about comparative education studies, signalled a shift or turn in orthodox comparative education origin stories. I suggest that this was a shift/break in the sense that it disrupted the prevailing story of what comparative education is or could be, but also a turn, or a move, away from the

largely modernistic premises of the field in Anglo-American Comparative Education. This ‘turn’, (Paulston, 2004)), has been met with vigorous condemnation by those in the field who would prefer the familiarity and predictability of a vision of the world as seen by the founding fathers of comparative education and education in general. The latest in this heated debate is the essay by Epstein and Carroll, “Abusing Ancestors: Historical Functionalism and the Postmodern Deviation in Comparative Education” *Comparative Education Review No. 49* (2005). Three years before that (2002), Nannes delivered his paper, “Origin Stories and the Discursive Constitution of Comparative Education” at Stanford University, USA. In 2005, Paulston drew his final maps, specifically referring to this collision of scholarship and knowledge cultures. These maps will be explained later in this essay.

Nannes, through his work, interrogated the origin stories of comparative education and traced (and also displaced) the dominant discourse of comparative education by using Critical Discourse Analysis (CDA) by looking at texts and publications that are being used to tell the story of comparative education (Nannes, 2002). In 1994, Paulston brought to the attention of the comparative education community, and to education theory at large, a map of the diverse perspectives present in the field. In doing so, he also introduced a particular way of looking at theory and research, one which was inclusive rather than exclusive of the various knowledge communities in comparative education. Rolland thus succeeded in marking important engagements the field has with multiplicity and difference. Representations of knowledge continue to change and grow in comparative education studies, as Paulston’s mappings of the field show (2004).

These remain disputatious times. Old orthodoxies are being contested just as local skirmishes accelerate into disciplinary wars; even if the old battles between the ‘scientific’ and the ‘non-scientific’ did not continue to divide scholarship. Beyond that, critiques of the ‘birth’ of the social sciences pointed out that the Enlighteners, for all their elegance and beauty of reason and humanitarian ideology, shaped a society hostile to social differences, and non-western cultures (as also non-scientific knowledge cultures), and had the unfortunate social effect of promoting harsh intolerance towards human diversity, and of carving social differences into individuals and groups (Seidman, 2004) This is not to say that social differences have not been asserted into individuals and groups far before the Enlightenment had anything to do with it, for reasons of religious or social categories, separating sect, caste, male, female and so on. In education discourse, however, as perhaps in other sites of identity building, we are still fighting over sacred relics, our small or big stories. There will always be the shrillness of acrimonious debating over the validity and ethics of one theory against the other as long as some ways of knowing are seen to be more valid or more valuable than others.

In this field, we have long been engaged in various non-harmonious ways of telling educational and sociological stories – a debate which has become recently tense and embattled, with the inclusion of the ‘post’ enlightenment theories, (postmodern, post-structural, postcolonial among others) the advocacy or condemnation of which have led those in the field to align their positions along both sides of an dichotomous theoretical divide. I suggest that this is an artificial divide: being opposed to the ‘universal stories’ of modern sociology does not imply an opposition to empirical science or to the idea that human studies may make a better world. It does imply however, that the

privileging of scientific truth over all others is seen to limit epistemological choice and a full understanding of human diversity. Discarding dichotomous divisions also suggests that an understanding of the human condition in society would be more enhanced by *not* discarding the promise of explanatory accounts of social realities, but replacing their rationales of ‘truth’ and social ‘progress’ with rationales of social justice and critical moral reflexivity, replacing their comparisons of models and functions with genealogy and narrative. Academic communities continue, however, to be invested in opposing theoretical stances linked with power, prestige, institutional sanction, personal ego or other reasons, maintaining the divisiveness of differing knowledge cultures. The theoretical divide is particularly harmful to students and studentship in the field of comparative education studies, but it could also have the larger effect of circumscribing research which has direct implications on individuals and institutions that plan and implement policy decisions based on education research, and specifically comparative education research. Binary logic and territorialism in academia also serves to decimate our own simple (and complex) humanity.

This essay-in-understanding seeks to take a view broader than the contentious one, to find the landscape that empowers and privileges learning, rather than territory, so that those engaged in the business of shaping ontological choice may first be engaged in the practice of unlearning, (a term coined by Heredero, 1989, in the context of social awareness) learning and relearning, in other words, ‘reflexivity’, a term used to refer to the practice of understanding a text through its own constructedness, or the understanding of the researcher through the constructedness of her own stories. To do this, I use Rolland Paulston’s last research and maps to identify and navigate “Big” and “Small” stories towards a comparative methodology that is inclusive of the process of how these stories are constructed and how they become big or small, and as Paulston shows through his maps, how narratives “see” and place each other in an interrelated web of connection. Using mapping methods and interpretations of CDA, my essay continues the discussion of how to *do* the ‘multiple’ (to map multiple knowledge perspectives) as both meta- and mini-narratives, specifically combining a modality of CDA and postmodern social cartography into pedagogy for comparative education studies. For those suffering post-enlightenment language fatigue, let me say that this is (simply) an exercise in enabling more *choice* in language and register, through which to describe our various worlds and views. Our interconnected and contentious, globalised milieu of academics, academic activity and institutions makes it possible to look upon the various wars of ideas and disenchantments, and ask, what is it that serves the purpose of a learning and teaching community at the end of contestation and disagreement?

Big and Small Stories

McCarthy and Dimitriadis problematise the organisation of knowledge in schooling itself following the industrial age: “Against the tide of ... currents of change, however, mainstream educational thinkers ... have tended to draw a bright line of distinction between the established school curriculum and the teeming world of multiplicity that flourishes in the everyday lives of youth beyond the school” (2001, p. 2), pointing out

one of the problems of excluding some stories from bodies of knowledge intending to teach and instruct. If seen through a genealogical lens, when binaries are adhered to, two separate bodies of knowledge are conceptualised, one in which there are dissenting opinions and theories, which may be excluded or rejected from other bodies of knowledge, and another which includes local beliefs and heterogeneous ontologies, which are unfixed and transgressive. At this impasse comes into play the deployment of authority and investiture, constructing the discourse of legitimate/academic/official knowledge, deemed 'knowledge' and excluding as 'not knowledge' the alternative body of knowledge, in its genealogical sense, choosing one knowledge culture above the many.

Mini-narratives (small stories, local, experiential, subjective and disruptive/transgressive/interrogative of meta-narratives) and meta-narratives (big stories, global, theoretical, objective and exclusive of small stories) then become discourses exclusive of each other. This bifurcation has particular effects on the wider process of research and understanding. Firstly, there is the erasure of voices as stories struggle to become part of a dominating discourse and the loss, or translated versions of those stories as they become part of the visible discourse (of research, of 'thick' or metaphoric sociological description, of policy and so on). Secondly, there is what I call the invisible problem (invisible since erasures have occurred), of denying the most plural view to the student of educational issues, a significant problem for a field that bases its identity in the cross-cultural and multi-disciplinary. The problem of erasures occurs between languages and identities, between experience and struggle. We are then faced with the problem of making problems; how questions are framed and logic laid out when knowledge orientations are effectively kept out. We are also faced with problems of inclusion, and what to include what not to; what is counted as knowledge, what then becomes 'legitimate' in the discourse.

Big and Small Narratives

Big stories, or meta-narratives, are overarching theoretical ideologies, or universal stories. Mini-narratives, or small stories, are specificities, subjective anti-theories that are ubiquitous (everyone has their own small story). Any narrative when 'grafted' (Sommers, 1999) on to a binary code which sets up a system of rules of exclusion and engagement (e.g., of social naturalism or religious values) may become a meta-narrative. The binary code then transmogrifies the narrative into a more potent force of authority and power, giving it 'naturalised' or 'god-like' sustainability in the face of evidence to the contrary. Which also means that there is an opposition built into this binary division, making its alternative an undesirable thing, contrary to the 'natural' or 'truthful' set of rules the meta-narrative is grafted upon. For example, the meta-narrative of the Enlightenment is so 'naturalised' as a state of social being that it is monolithic enough to spawn any number of theories addressing the 'natural' need for society to better itself, supporting the truth claim that this is a universal aspiration. My point here is not to demonise the desire behind meta-narratives, or to demonise any narrative for that matter. What I mean to do here is to highlight that part of the process in the formation of meta-narratives that becomes internalised, entrenched and

taken for ‘truth’ myths about the state of society, or individuals in it. Sommers, in her essay tracing the building of a meta-narrative suggests that narratives, when they become meta-narratives, cannot be easily destabilised. Based as they are on a binary logic, they have two important effects: they create and maintain boundaries of inclusion and exclusion, becoming epistemological “gatekeepers” (1999, p. 145), where the more ‘valid’ knowledge cultures become those based on this foundational knowledge schema or binary logic, and the less ‘valid’ are deemed those based on contingent logic. Thus, knowledge cultures are set up to be opposing and mutually exclusive.

I suggest that small stories more often than not interrogate meta-narratives, are plural and local, sometimes referred to as subversive discourse when they appear in opposition to the meta-narrative. Mini (small) narratives question the authority of a meta-narrative and are usually the site of uncovering the limitations of theory. Andreas Musolff (2006) calls small stories “source concepts” and has analysed the organisation of source concepts into mini-narratives in the construction of social debates. Mini-narratives are those useful vehicles used in sociological studies for the benefit of a researcher who goes on to construct the pattern of these ‘incipient stories’, or ‘experiential narratives’ according to Conle (1992, pp. 165–190) against a conceptual framework, or, in other words, a big story of choice. However, small stories are what their proponents say they are, and are to be unknown until they are brought into a public domain. In this durbar, turning to Paulston’s map of knowledge cultures within big and small stories provides a welcome disruption: All stories are mapped as texts, ‘telling’ a particular kind of story which then has certain effects and implications. More importantly, the map provides a way for texts to talk to each other, and for stories to find connection. As a student faced with competing claims of truth and power, it is invaluable to be able to see this landscape as *one* system of interaction, which may then be remapped to alter the dynamic presented there. In the end it is about the need for a choice of an alternative language, access to the alternative and the ability to craft one’s own register within the languages of both meta- and mini-narratives.

Paulston did his final map for the 2004 CIES Annual conference. It was a conference at which he could not be present because of his failing health, but it provided a rich, generative signpost for possible futures for the people in comparative education studies. The next section is devoted to the map he drew by hand (reproduced here electronically), followed by my reading of the map and its possibilities for crafting a different pedagogy for comparative education studies.

Rolland asked, “How are we to practice our comparative art in this time of heterogeneity and tumultuous change?” To date, several options have been presented. One is to hold fast to the eternal truths of our founding fathers. Another is to embrace and privilege the cultural differences of Others. And there are also those who would avoid the issue altogether, using a strong dose of scientific rigour – and, perhaps, cultural blinders. In contrast, I would like to argue for the re-inscription of all “big stories” into a space, or field, of little stories. This ontological and epistemological turn from a binary logic of exclusion offers the possibility of a more diverse and interactive cartographic representation of our field. Thus, the perspectives constructing knowledge debates may be mapped into webs of difference that are open to other actors and other possible stories. This is not to argue for a neutral position or a neutral language

in which to compare difference. All theoretical choices offer a view of the world in their own terms, and all can be critiqued from the position of another theory. We can, of course, insist on the absolute validity and orthodoxy of our view and attempt to exclude other accounts as deviant. Or we can embrace Clifford Geertz's great 'refusal' to impose a single reductive story on the wonderful varieties of human understanding. At the end of a long scholarly road, I opt to join those who willingly attempt what may seem to be an impossible task, 'to acknowledge the partiality of one's story (indeed, of all stories) and still tell it with authority and conviction' (J. W. Scott, 1991, pp. 42–43). while mapping it into the debate field of comparative education. In this way, we begin to visualise how our field may be seen – constructed as a representation, a picture of our complex multidimensional reality" (Paulston, 2004).

Paulston's map (reproduced in the following pages) shows the ontological divide that separates spaces where it is possible for small stories to emerge while also illustrating the conditions for such possibilities.

Paulston's map describes and maps five discourse genres through their core values, ontology, epistemology and disciplinary focus. The discourse genres chosen here are idiographic, nomothetic, ethnographic, agnostic and cartographic: explained fully in the table of genre attributes following the map (Table 1). It might be useful for readers to imagine 'text' as narrative – written or spoken, with its specific beginning, its present events (a middle) and its ends, denouements or conclusions that fix the narrative or its world view with a particular knowledge culture.

Although the map shows opposite knowledge constructs, these need not necessarily be opposing unless the value systems of narrators (mappers) are constructed to be opposing. I would suggest that the circular nature of the map of knowledge cultures shows also what is left out of one's own narrative when it appears alongside another's. Thus the map begins a dialogue or a 'multilogue' (engaging communication on multiple levels), towards an unlearning and relearning as one re-maps and interrogates the map itself, and one engages with other narratives, because the 'other' is now in relational discourse with 'me'. It is hoped that the map and its coordinates will provoke its own debate. For the purposes of this essay, it has led me to reconfigure my own theoretical positions and to rethink my own knowledge culture. A commentary on possible pedagogical modalities for the field of comparative education ends this essay-in-understanding.

An original of the map reproduced here is to be found with the University of Pittsburgh's Occasional Papers series (USA) (Figure 1).

Doing the Multiple: How Postmodern Social Cartography and Critical Discourse Analysis Work Together

The question remains of how to operationalise multiplicity and subjectivity. I suggest a modality called multilogue, which constitutes a number of pedagogical themes. At the level of *text*, Critical Discourse Analysis (CDA) focuses on social, historical and political contexts of discourses. This school of thought looks at the relationships between discourses, the effects of discourse on human subjectivity, and how power and

knowledge circulate through these effects (Foucault, 1980). In Luke’s writing (1999), according to Foucault and Derrida, language and discourse are “not transparent or neutral means for describing or analyzing the social world. ... (Foucault) refers more generally to reiterated key words and statements that recur in local texts of all kinds. Such statements appear intertextually across texts and comprise familiar patterns of disciplinary and paradigmatic knowledge and practice” (Luke, 1999, p. 163). Derrida questions whether authoritative interpretations are at all possible, being that all texts are polysemous (the dynamic play of difference where multiple, unpredictable and idiosyncratic meanings can be made by multiple readers in multiple social contexts).

Thus 'text', in social cartography becomes 'narrative'. Multiple users of the map can re-map, re-tell their texts in relationship to the other narratives on the map.

CDA therefore begins from certain assumptions of "systematic asymmetries of power and resources between speakers and listeners, readers and writers (that) can be linked to their unequal access to linguistic and social resources" (Luke, 1999, p. 167). Fairclough and Wodak (1997) further elaborate on the task of CDA as being both deconstructive and constructive. According to Fairclough and Wodak, the deconstructive moment of CDA disrupts the power dynamic of textual and verbal events and problematises the themes of these events. In its constructive task, CDA allows for a vast resource for students to critically analyse social relations by distributing the resources of discourse in an equitable process.

According to a review of CDA literature done by Peter Nannes (Nannes, 2002), Critical Discourse Analysis assumes discourses, through language, to be forms of social practice and that they are dialectically constituted within social situations that are also constituted by them in a mutual process. Nannes shows us how discourses have material effects that can shape, reproduce, disrupt and reshape relations of inequality and is therefore a form of social action. In the treatment of textual material (written word), CDA makes use of some degree of systemic functional linguistic methods. Employing lexical and grammatical features of texts, as argued by Halliday and Hasan (1989), have three functions:

At the level of 'field': texts represent and portray the social and natural world

At the level of 'tenor': texts construct and effect social relations

At the level of 'mode': texts develop identifiable conventions in particular media

'Field' also represents texts as the written and spoken word as particular selective views of the world, or 'subject positions. 'Tenor' may be seen as 'reading positions' that the text set out as social relations. Texts, by their 'mode' of establishing reading positions can position readers, situating them in identifiable relationships of power and agency vis-à-vis the text.

In CDA, typically, subject positions (of texts) have analysed cultural assumptions in the textual macro-structure, focusing on selective traditions of values, ideologies, 'voices' and representations. Such techniques allow the text to be analysed to demonstrate how they structure and stipulate social relations between human subjects and "how they build differential relations of power and agency between readers and writers, between students and textbooks" (Luke, 1999, p. 170). Through this perspective, discourses may also be seen as discursively reconstituted by the very discourses that may have been deployed to limit and divide them. Thus, because of the repeated action made by students and teachers upon the texts of the discourse, these discourses are ultimately in the hands of those who are acting upon them. The topic of analysis, such as value and beliefs systems about education, or poverty alleviation, is what people say or think it (the topic) is (Game & Metcalf, 1996).

CDA studies the interpretive grid, as it were, of what *is* said, in text and speech, what is *not* said and what *cannot* be said. This method focuses on the specific condition under which 'reality', 'truth' and 'knowledge' claims are made and sustained, and the conditions under which particular discourses and imbedded discourses are seen as

more dominant than others. In a sense, CDA becomes a key process in the creation of a map made by multiple users, as the critical step towards working out the coordinates of the map.

Foucault described how some discourses and not others become prominent in particular contexts, the conditions of this prominence and the maintenance of it and the relationships of power between their mutual functioning, and their transformation whether independent, reciprocally or co-relatively (Foucault, 1972). CDA allows one to interrogate discourses by questioning how various spoken, written and symbolic texts constitute and define knowledge, learner, educator, academic and institutional identities within the relationships of power and social-historical conditions through which these discourses are manifest. CDA are not only concerned with the contents of documents, but also with the process of their development and outcomes.

The challenge of mapping multiplicity would be engaged when there is more than one mapper working on creating a map of knowledge constructs. As Paulston (1996, p. xvii) points out, mapping recognises and patterns *difference*: “[A] spatial turn in comparative studies would focus less on formal theory and competing truth claims and more on how contingent knowledge may be seen as embodied, locally constructed, and re-presented as oppositional yet complementary positionings in shifting fields.” Paulston gives us a general outline of the process of mapping in six stages:

1. Choosing “the issues and debates” to be mapped
2. Choosing the “range of texts that construct these debates”
3. Conducting a “close reading and macro-analysis” of these texts (or narratives)
4. Identifying the “range of positions in the intertextual mix”
5. “Sharing”: Paulston recommends identifying textual communities that share ways of seeing and communicating reality and their locations in the mapping. One might also find differences.
6. “Re-mapping”: The last, and I feel, most significant point in the mapping process, regarding pedagogy, is Paulston’s recommendation to test the map with individuals or knowledge communities involved, and then to re-map as desired and or share conflicting interpretations of the map.

The mapping process requires a choice of coordinates along which to map the various stories told by the text. This can be negotiated through differences or similarities, which also have divergences within them, leading to re-mapping. CDA may come into the mapping process at anytime and with any narrative, the analysis of which would alter its place on the map.

Multilogue

The concept of multilogue (my coinage) questions the idea that pedagogy of difference can be crafted exclusively from the classroom. In the end, the space of most fluidity may be found in spaces other than the traditional (such as classrooms), perhaps in

cyber-space versions of a combination of CDA, which uses language to deconstruct discourse, and postmodern mapping methods, which mobilises the positioning and situatedness of the actors who choose to be within the discourse, and other processes-oriented tools of critique and representation. The concept of multilogue extends the pedagogical sites of meaning construction from the classroom, to any environment through which common and/or different space is represented. It takes the concepts of dialogue and multiplies them so that there may be the creation of an internal and external map, as well as the ability to share and discuss the differences that these maps manifest. The communal space that represents mapping discourse as a group, presents, I argue, the means by which to change ontological and epistemological coordinates, introduce new ones. Thus, the actors of the discourse are to be engaged in the construction of a deeply meaningful way of creating 'knowledge', or perhaps even 'problem-solving', in a fashion that allows for personal expression as well as collective interaction with others in the discourse.

Rolland Paulston had made it his life's work to construct and reconstruct knowledge perspectives in order to be and become more and more reflexive and inclusive. Going beyond the contentious debates of modern against postmodern, orthodoxies against heterodoxies, he looked upon the future of international scholarship in terms of its heterogeneity: networks and synergetics. This is the manifestation of a belief in multiple realities, with space for both big and small stories, multidimensional, complex, mutable and embodied, where intertextual relationships take over what meta-narratives left out. Thus we move from shared and isolationist histories, the big stories of national systems and social movements, and the interruptions of small dissensions and other stories, or mini-narratives to a process of synergy and continually changing discourse.

Multilogue works under the following conceptual framework:

- Concern for Otherness and Othering, as constructive and destructive concepts
- Recognition of the simultaneous existence of multiple voices
- Acute and self-conscious bias towards enabling tentative and silenced voices
- Recognition of the existence of liminality, hybridity, transitions/transitologies and of motion in all narratives and knowledge cultures
- Recognition that deconstruction and reconstruction, situatedness and fluidity are empowering and desired in a learning process
- Recognition of the existence and effects of power
- Recognising the limits of each story: that all knowledge is partial and is built through the interaction between reader and texts as well between multiple communications
- Recognising that everything is dangerous, and that being able to engage reflexively at all levels keeps us generating connective forces rather than static, silencing forces

Combining CDA and postmodern social cartography gives us a way of operationalising a sort of 'multilogue'. According to the 1920s literary theory of Mikhail Bakhtin, all utterance is dialogic in that it anticipates the response of the addressee and is accented towards another. That is to say, we are defined by our own perceived relationship to others through speech. Bakhtin wrote about the intrinsic connectedness of temporal

and spatial relationships in cognitive and meaning-making situations. However, it was Foucault and Lefebvre (1974) who privileged space over time, signalling the end of ‘despatialised’ history. Rebecca Martusewicz’s *Seeking Passage: Post Structuralism, Pedagogy, Ethics* describes Serras’ idea of ‘noise’ (often dismissed as so many small stories): “Serras writes about the ‘beautiful noise’ or the ‘excess empirical’ of every text and every claim to knowledge, in the spaces of meaning that escape the capture of representation” (2001, p. 13). If inquiry were to be so pedagogically configured as to *include* that noisy third through a process of multilogue, such as is possible with the mapping process, then there is a space and perhaps many spaces open to the knowledge within the ‘excess empirical’. In effect, it may open the discourse of other potential meanings and forms, the creative process of applying all the plural parts of the individual learner, eclipsed or suppressed desire and understanding of the human condition, into the public and private sites of knowledge creation.

Beyond the Postmodern: In Conclusion

Postmodern themes in pedagogy are useful because they change the entire paradigm by which to approach knowledges, while they also destroy the system of paradigmatic boundary-making. Stronach and McLure (1997) show quite effectively how a re-reading of educational research, or perhaps an undoing of it, break not only the practise of boundary-making and maintaining, but also unearth ‘new’ insights into old research. In that sense, postmodern pedagogies, are both micro and macro: micro in that they are concerned with the minute details of research relationships and macro because they are concerned with effects and actions and influences outside and beyond these details.

Perhaps the strength of comparative education studies lies in the ability (or possibility) to allow diversity in the field to actually inform the field. It is after all, one thing to present differences in theories and concepts, quite another to operationalise them in the research of the field. Presenting theories may mean that they are presented as far-away, static spaces to use or not depending on the context defined. My argument has been for a way of presenting a multiplicity of views that allows for a process as well as for the ‘interference’ of personal agency (whether teacher, learner or Other), and that also allows for the possibility of movement, of relationship, of perhaps, connective tissue. Multilogue, as CDA and postmodern social cartography addresses the unexamined effects of power within an experiential knowledge paradigm (when mapping takes place as an investigation into desire), allowing all actors to place themselves self-consciously within a discourse. Multilogue, ultimately, breaks the barrier and the power relationship between instructor and instructed, engaging both in the learning process. Only a collective can produce a working model of multilogue, and this suggests a next phase in traditional ways of doing research. In a sense, it begins with a readjustment of values, as an invisible pedagogy, a process begun before the manifestation (mapping) of stories and the shared learning (re-mapping) is done.

Through Rolland Paulston's work, and the extensive interpretations of CDA done by Peter Ninnes and others, it has become possible to look through and then beyond both the harsh exclusions of meta-narratives and the sharp subjectivities of mini-narratives towards processes that illustrate possible connectedness (rather than the static divide) of these knowledge cultures or choices, as well as their dependence on each other. For a student trying to tell a story or a set of stories through a space competing for validity of various kinds, working through text and through visual, spatial media could provide an escape and a personal affirmation in the face of the monolithic censure of academic legitimation. The backlash from those who felt we have to contain and discipline the field into a more secure, predictable community surely understand that there is really no going back, because the past was never static and because the content, people and places of comparative education are variegated. The studentship of comparative education is globally engaged, whether contentiously or seamlessly. Indeed the identities of most are plural, culturally, ethnically and even perhaps ethically.

It is a fearsome thing, to think of the unimaginable stories that await representation; mapping the unimaginable is an uncomfortable, unpredictable thing. I want to echo Rolland Paulston and Peter Ninnes, and offer the challenge of allowing the self-conscious and biased process of mutilogue to become the choice of method, rather than choice of theoretical consolidation to become a method. Theory thus becomes vehicle, towards the unpredictable outcomes of research. Simply put, we need to start at some point, which will necessarily and admittedly be limited and myopic, but intensely subjective and intimate, hence invaluable. Then we continue, in Paulston's conceptualisation, to think in terms of a circular and netted map, rendering the 'starting point' of research only vestigial in its linearity, focusing, not on endings (although there will be conclusions) but on continuation and learning through debate and discourse. In the end, it will be the students of comparative studies that push boundaries in any meaningful ways, but only if there is the freedom to embrace the impossible, the subversive and the unthought-of, and the alternative, whatever that may be. At a pedestrian level, it would mean the incorporation of reflexivity into every teaching event, asking of all research, "What is the alternative? Where, and who is the Invisible", as Susan Star does (1991) in her essay on the 'Sociology of the Invisible', being able to name known alternatives and then to allow other alternatives to name themselves. This is not to imply, in any way that 'post' anything is the new and glittering direction in which we should all aspire to go. That reinforces only that we should *not* remain in the grip of one or the other orthodoxy. However, it would take real courage of academic spirit to have the landscape of context (the multiple present), of history (the multiple past) and of abstraction (multiple possible futures) in the service of learning above service to agenda or ego. It is a messy direction, but I feel, infinitely generative. Advocates of obedience to sacred texts may do so because of the predictability of method and inquiry. If predictability means 'being safe', then by all means let us be safe. Should we then not also be safe to be different and differing, and should we not also have a safe space in which to engage these differences? Comparative education, as any field of cross-cultural investigation deserves at least that.

COMPARATIVE EDUCATION IN TWO ASIAN CONTEXTS: A JUXTAPOSITION AND SOME QUESTIONS

Wang C., Dong, J. and Shibata, M

Introduction

The history of ‘comparative education in China and in Japan is fascinatingly different. Both countries, of course, share many aspects of cultural history, major belief systems, and some aspects of governmental tradition (including the tradition of Confucian assumptions about social and political harmony). Yet the individual (but overlapping) histories of the two countries are powerfully different and have taken them in dramatically different directions at various points in the late nineteenth and twentieth centuries.

It is possible to provide a juxtaposed account of these developments, but writing the histories is, paradoxically, a job for the future: it will require a great deal of subsequent work to define and to dispute these ‘histories’ in a serious and comparative way.

A great deal of work has already been done on the various ‘comparative educations’ of Europe, or Europe and North America. Certainly with individual accounts of comparative education being assembled for a range of countries, and for professional Societies the basic sorts of information that permit thought are beginning to be assembled.

But we are nowhere near yet in terms of grasping the comparative sociologies and geographies of ‘comparative education’: How do the shape and style of comparative education change over time, affected by the politics and sociology of specific contexts?

We Are Not Sure

Therefore, it is suggested that these ‘histories’ of comparative education in China and Japan – which are here merely juxtaposed – are an indication of some of the work which needs doing in the future. The ‘histories’ of comparative education in East Asia need defining and rescuing. These brief sketches are a first step, a hint about unresolved issues, a sketch of the ways in which knowledge – comparative education – is related to social context. As authors, therefore, we have chosen to keep our sketches separate.

China: The Evolution of Chinese Comparative Education [Wang C., Dong, J.]

Most accounts of comparative education stress the English-speaking tradition, but there is also a major tradition of comparative education in East Asia.

A number of Chinese scholars in comparative education say that the Chinese comparative education has experienced similar development stages as in the Western countries (Li, 1983; Cheng, 1985; Wu & Yang, 1999). Since 1949, Chinese comparative education has been heavily influenced by political, social and cultural changes in the country and has gone along a bumpy road.

The Stage of Prehistory

In ancient China, there was discussion about education from a comparative perspective, and at a later stage, articles or reports on foreign education by travellers spread. It is hard to say that at this stage there was any comparative study in education. During the period of the Spring and Autumn (770–476 BC), the historical records show that both Confucius and Mencius once made comparisons about politics, cultures as well as education of the Xia, Shang and Zhou Dynasties (Wang, 1999). By the seventh century of Tang Dynasty, Huang Zunxiang's 'Records on Japan' and Xuan Zang's (602–664) 'Records on West Regions' presented broad pictures on education in both Japan and India (Li, 1983; Wu & Yang, 1999; Wang, 1999). The exchanges of cultures and education with neighbouring countries such as Korea, Japan and India can be traced back to the Han Dynasty (202 BC).

The detailed introduction of foreign education to China started in the late sixteenth and seventeenth centuries, mainly by Western missionaries in written form (Li, 1983; Wu & Yang, 1999). The education systems, teaching methods, together with history of Western education, became increasingly popular in China, which resulted in a great and long debate nationwide in the nineteenth century.

The Stage of Description and Borrowing

China has a long tradition of culture and civilization of five thousand years. In the past dynasties, the cultural superiority complex in the Chinese academic field resulted in neglecting the study of foreign cultures including education. Only during the Opium War of 1840, when foreign industrial and military forces opened the door of China to the outside world, there began the self-questioning of Chinese intellectuals on outward looking ways for China in all fields. In this regard, education played an important role.

In the late nineteenth century and early twentieth century, nationwide debate on how and what to learn and borrow from foreign experiences including education began among intellectual circles, as well as all walks of life, and practices copied from foreign education systems were experimented in education. The debate on 'Chinese Essence, Western function (Zhong Ti Xi Yong)' which built the notion that '[t]he Oriental worships Dao (the spiritual civilization) and the Western worships

techniques (the material civilization)' reached its peak during the May 4 Movement, a new cultural movement. The Movement to some extent was anti-tradition, namely, anti-Confucianism. The refusal of anything foreign was taken as one of the major obstacles impeding China's progress towards modernization. In response to this, the strategy of Western Democracy and Science was put forward. During this period, comparative education gradually earned its reputation within the more general field of educational studies (Cheng, 1985; Wu & Yang, 1999).

A number of articles, translated books and even teaching materials on foreign education with a descriptive and introductory nature were published and adopted. The first publication on comparative education in a real sense was found as early as 1901 (late Qin Dynasty) in a journal entitled 'World Education'. In the same year, a four-volume teaching compendium introducing education in Germany, France, United States, Britain and Japan developed by the Hubei Provincial Education Department was adopted. One additional publication was the 'Status-quo of World Education' edited by Lu Feikui in 1911 (Li, 1983; Cheng, 1985). The three publications sparked a start in comparative studies in the field. In the following years, more than 40 books on comparative education either edited or translated by Chinese scholars were published. Luo and Wei translated the work of Kandel on Comparative Education (Cheng, 1985; Wu & Yang, 1999). The publication introduced the methodology of comparative education to China, which was widely adopted by Chinese scholars in the field of comparative education.

All the publications on comparative education at this stage were mainly focused on the introduction of Western education together with the research findings of Western comparative education.

The Stage of Professional Study

The term 'comparative' was first found in a book entitled 'Education in Germany, France, Britain and US from a Comparative Perspective' edited by Yu Ji in 1917 (Li, 1983). It was written mainly on the basis of similar work by a Japanese Scholar and hardly had any extra work by the author himself. The real start of comparative education research was after the May 4 Movement in 1919 with the introduction of Russian education and lectures of a number of American educators such as Dewey, Monroe, Michael, etc., who were rather influential in the field of education as well (Wang, Zhu & Gu, 1985).

This period of comparative study can be represented by four books which are the most important and influential works in the field of comparative education written by Zuang (1929), Zhong (1935), Chang (1936–1937) and Luo (1939) (Cheng, 1985; Wu & Yang, 1999). They were based on the comparative analysis of education or school systems in a wide range of countries with a detailed analysis on education at different types and levels in Germany, France, Britain and the United States.

Zuang's publication of "Comparative Analysis of Education in a Variety of Countries" resulted in a required course in comparative education being established in China Normal University and departments of education of universities (Li, 1983).

The works written by Chinese scholars at this stage can be streamlined into three categories: first, a thematic introduction of different types of education in a number of

countries in a juxtaposed manner; second, a full picture of education depicted country by country; and third, an integrated description of the first and the second above (Wu & Yang, 1999). The methodologies, that is, the historical approach, adopted in the studies were mainly copied from colleagues in Western countries.

Changes and Development in Comparative Education After 1949

Unlike the Western tradition of comparative education (to my understanding, the development stages of comparative education in Western countries are more or less linked to the works published by the eminent scholars in the field), after 1949, the founding of new China, the development of the Chinese comparative education are closely linked to the political, social and cultural changes in the country. This can be roughly categorized into four stages represented by zips and turns.

The first stage was from 1949 to 1957, which was a period of nationalization and reorganization. This stage witnessed a process of taking over the system of education and the ‘old regime’ institutions of the republic – and formulating a highly centralized control over education. The education system and aspects such as organization and structure, education theories and practices, and even teaching curricula and textbooks were solely patterned on the Soviet model. Chinese comparative education was no exception. Since there was no ‘comparative education’ in the Soviet Union, comparative education in China was abolished both as an independent discipline and teaching subject (Li, 1983; Cheng, 1985). The education researchers and studies focused only on the Soviet system. In the 1950s, a large number of Soviet works on education, that is, history of education, pedagogies, educational psychology, etc., were translated and published in China (Wu & Yang, 1999).

The late 1950s till the first half of the 1960s showed a stage of a ‘great leap forward’ in Chinese comparative education. In line with the ‘great leap forward’ movement in the economic field and the adoption of a positive foreign policy, the exchanges with other countries in the world were increased rapidly in all areas including education. In the meantime, the friendly relationship with the Soviet Union was abruptly broken in the early 1960s. As a result, radical changes occurred in all spheres of society including education. At this critical moment, China had to turn its eyes on other parts of the world. Comparative education in China followed along the same line. Five research institutes on foreign education study were established in universities, that is, Peking University, Qinhua University and Beijing Normal University, from 1961 to 1964, focusing on education in Western Europe and North America, Soviet Union, Japan and Korea (Wu & Yang, 1999; Wang, 1999). The main assignments of these research institutes in the mid-1960s were first to learn and study, and second to collect information and materials. The only in-house publication was a journal named “*Trends of Foreign Education*” edited by the research institute of Beijing Normal University (Li, 1983; Wu & Yang, 1999).

In line with the state ideology, Marxism, Leninism and Maoism were taken as the guiding principles of comparative education. The theories and methodologies adopted

in the comparative field were historical materialism and dialectics advocated by Marx, Lenin and Mao. Other schools of theories and methods in comparative education of Western origin were largely rejected and even criticized.

The 'Great Cultural Revolution' (1966–1976) saw another stage of stagnation in the field of comparative education. Anything foreign was abandoned and criticized as rubbish and anti-revolutionary. Chinese comparative education was again the victim. All research establishments on foreign education study were dismissed and a number of eminent scholars in the field persecuted (Li, 1983). Though there were piecemeal studies on foreign education in the early 1970s, they were solely for the purpose of political needs (Li, 1983; Cheng, 1985; Wu & Yang, 1999).

1977–1985 experienced a phase of rehabilitation and recovery of political, economic and social order along the lines of the pre-Cultural Revolution period, in which education was also in the process of recovery. Hence, China switched its national focus on the nation's economy with the adoption of the open-door policy in political and socio-economic affairs. From 1979 onwards, the issue of change and reform of educational structure was put on the national agenda; a decision on the reform of the educational structure (May 1985) was adopted. This change was represented by a nationwide system reform of education, which covers almost all spheres of education. Chinese comparative education also experienced a period of recovery and impressive development.

The Ministry of Education organized a seminar on the recovery of Chinese comparative education in 1977, with participation by the scholars from the previous four comparative research institutes (Li, 1983). The four research institutes were not only re-established but also expanded in both institution and research area terms. In addition, new research institutes or units were built, such as the comparative education research unit in the National Institute of Educational Research (1979) and a foreign education research section in the department of education headed by Professor Wang Chengxu of Hangzhou University (1979).

The last two decades have witnessed an unprecedented stage of development in Chinese comparative education, which is represented by the establishment of the guiding principles of comparative studies in the field. The shift of national focus on economic construction resulted in adjusting the national objectives in education and its research orientations. In terms of comparative education, Deng Xiaoping's 'education should be oriented to the modernization, world and the future' is taken as directive ideology for building the discipline together with the theories, view points and approaches of Marxism and Leninism. In addition, comparative researches and studies were on the laws and successful practices of global education to serve for the construction of socialist modernization with Chinese characteristics (Zhang & Wang, 1979). Along with this line, the different theories and methods from abroad have been introduced to the field and widely adopted by the scholars of comparative education in consideration of the national context.

The foci and topics of concern are changing with the political, socio-economic and cultural contexts in the country. In the late 1980s and early 1990s, keeping in mind that the dual objectives of comparative education were to 'centre on the excellence of education' and to 'promote educational development and reform' in China in

conformity with the national development plans, the starting focus of comparative study was mainly on education systems of six developed countries, namely, United States, Soviet Union, Britain, France, West Germany and Japan, ranging from pre-school education to higher education including secondary technical and vocational education, teacher education and education administration (Li, 1983; Wang, Zhu, & Gu, 1985; Gu, 2005). In the meantime, the research focus was also on second-hand materials about foreign education so that information and data which might be helpful to the reform and adjustment of the education structure of the country were processed and analysed to serve practical needs.

Following the increasing advocacy of national open-door policy, the international exchanges in terms of personnel and documentation were greatly encouraged and accelerated. The professionals in the field of comparative education had wide opportunities to study and research in countries of their interests with the first-hand materials and their own experiences. Diversification was the main feature at the 1990s stage. The foci and topics of comparative education were widely expanded and getting more specific. In addition to studying on theories and practices of education structure reforms of other countries, there were themes like cultural tradition and education modernization, education and market economy, education and social progress, etc. The diversification was also in terms of theories and approaches adopted in the field of comparative research. A large number of books on comparative education mainly from Western countries were translated and published in China. In the meantime, the adoption of our own philosophies and methods in the comparative study was encouraged. The study became analytical rather than descriptive. Chinese comparative education 'entered a stage of thematic studies'. In other words, comparative education research has shifted "from macro research such as system studies to a micro one, that is, curricula, teaching modes and methods, etc. They are all closely related to the education reform and development in China" (Gu, 2005).

The diversification is evident in the publications of comparative education as well. A number of research findings and publications came into being with a wide range of topics. Since the 1980s, the publications in the field can be sorted into four categories: (1) teaching materials for higher education institutions, the most important of which were 'comparative education' edited by Professors Wang, Zhu and Gu, which was the first teaching material after 1949, with the first edition published in 1982 and the second 1985, and the other entitled 'comparative pedagogics' developed and edited by Wu and Yang in 1989 and revised in 1999; (2) comprehensive and thematic research works, that is, a three-volume short history of comparative studies of Chinese and foreign education edited by Zhang and Wang published in 1979, a pioneering work in Chinese comparative education which intends to place the comparative analysis of the history of both Chinese and foreign education in a broad frame of historical and cultural context of the world and is expected to provide both theoretical and practical bases for the education reform in China; (3) selections and translated articles; and (4) series, the most influential two sets were 'series of foreign education' with more than 30 volumes in the late 1970s and 1980s and 'comparative education series' with 9 volumes with a wide extent of topics like Gu and Xue's 'introduction of comparative education: education and national development', Wang's 'history of comparative education', Wu's 'comparative teaching theories', Hao and Li's "comparative study on education legislations in differ-

ent countries', etc., in the 1990s (Li, 1983; Wu & Yang, 1999). Since the early 1990s, China has entered its second round of reform and opening and speeded up its process of integrating into the international community led by the United States. An increased number of scholars were involved in collaborative projects with international agencies and education institutions of other countries. The areas of comparative education studies have been greatly broadened and kept abreast with the international field, that is, the cultural perspective of study, international and indigenous education, etc. The current comparative education in China is developed along two lines, one is on academic or professional studies with in-depth analysis, and the other is based on practical needs. The former is more focused on the theoretical and scientific researches and has a limited impact on policy-making and practices and the latter is centred on evidence-based studies and has a stronger impact on the current practices in education.

'Policy-makers in an increasing number of countries are becoming aware of developments in education and training necessary to meet the challenges posed by globalization. Comparative and international education studies are able to provide the information needed by these policy-makers to assist them in their quest for educational practices and innovations necessary to meet the challenges' (Wilson, 2003). It is evident in China. The comparative practice is becoming an indispensable part of decision-making processes in education in China. The National Centre for Education Development Research and other departments for international exchange and cooperation in the Ministry of Education are the main components to undertake the mission of comparative studies and information provision. There are a number of special issues, bulletins or references on comparative analysis and descriptive introduction of strategies, policies and practices in all areas of education of both developed and developing countries circulated mainly in the ministry.

During the period of recovery, the academic societies in the field of comparative education emerged. The Research Society of Foreign Education (later changed to the China Comparative Education Society (CCES)) was founded in 1979 and admitted into the World Council in 1984. The Journal of the Society, '*Foreign Education*'¹ was created in 1980. The first National Conference of the Society was held in 1978 with 50 participants and the latest 13th National Conference in 2005 with 260 participants (including scholars from Hongkong, Taiwan and postgraduate students in comparative education). The membership has been raised from 130 in 1981 to more than 500 in 1989 (Beijing Normal University, www.compe.cn).

In the 1980s, comparative education as either compulsory or elected course was introduced to the bachelor programmes at normal universities or the departments of education of comprehensive universities. Started from 1979, comparative education as an independent discipline was introduced to both Master and Ph.D. programmes (Wu & Yang, 1999). For instance, Hangzhou University introduced comparative education for graduate students by Professor Wang Chengxu in 1980. At a later stage, a Masters' course was offered in 1982 and Ph.D. in 1984 in the same university (now named Zhejiang University). Nowadays, Ph.D. degree in comparative education is awarded in 7 universities and Masters' degree courses are offered in 30 universities (Wang, 2006; Gu, 2006).

The main bimonthly academic journals and periodicals are: *Comparative Education Research* of Beijing Normal University (also known as *The Journal of the Society*),

Prospect for Global Education of East China Normal University, *Foreign Education Review* of North East China Normal University and *Primary and Secondary Education Abroad* of Shanghai Normal University. In addition, the translation and publication of Chinese version of *Prospects* of UNESCO International Bureau of Education (IBE) started in 1980. More and more reports and documents prepared by the international organizations such as UNESCO, UNICEF, UNDP and World Bank have been translated into the Chinese language and added to the publications of comparative education in China.

JAPAN: Introduction

[Masako Shibata]

This part of the chapter tries to trace the history of comparative education in Japan. Comparative study emerged and began operating not necessarily in the university in the case of Japan and elsewhere. The ideas and operation of comparative study have been outlined essentially within the processes of the construction, destruction and reconstruction of the modern state and society. On this analytical ground, I understand that comparative education as a field of study is a modern project. This article on Japan, therefore, starts with my understanding of the development of Japan as a modern state before looking at how the study has been shaped as an academic field in the university. The processes of Japan's steep learning curve in inspecting and absorbing foreign models demonstrated a slow genesis of the history of comparative education in the country. That is to say, this field of study has been shaped within the generative and regenerative processes of a modern Japan, its society and its education.

To attest this, a number of *modern* aspects of comparative education will be discussed with special reference to Japan. They are: firstly, the concept of the *state* and its power as the major theme of the study; secondly, the unchallenged, linear notions of *progress*; and thirdly, the aspirations of *science*.

The Onset of Japan's Steep Learning Curve in Learning from the Others

In nineteenth-century Europe and America, education was regarded as an important social institution for the development of the country. The French, the English and the Americans, for example, recognized that finding 'better' education and absorbing it were a key and a most effective strategy for improving their own education. During this period, their educational bureaucrats spared time and labour to inspect foreign education. So did the Japanese. They had sought better education in more advanced societies outside the country to make it rich, powerful and enlightened.

Japan's steep learning curve in studying foreign countries had started before the country became a State in the Meiji era (1868–1912). Feudal fiefs in the Tokugawa shogunate (1603–1867), despite the Shogunal tradition of isolation policy, invested in, or turned a blind eye to, the travelling of their young *samurais* abroad. Some of the fiefs, like Satsuma and Choshu (Satcho, in short) whose *samurais* later played the

central role in the Meiji Restoration, had appealed to the shogunate to recognize the need of absorbing knowledge in Europe and the United States. In this respect, those fiefs were foresighted in arguing that this would ultimately meet the ‘national’ interest. As a result, 60 *samurais*, of which 37 were from Satcho, went to Western countries, mainly to England (34), the United States (30), France (5) and Holland (2) (Ishizuki, 1972, p. 104). In the process of the construction of the modern Japanese State, those who opened their eyes to foreign countries – exclusively Europe and America, but not Asia – assumed leadership of State affairs in the coming era. The passenger list shows the names of chief personnel in the Meiji regime, such as the Ministers of Education and professors of Tokyo Imperial University. Eventually the Shogun himself dispatched 80 men to France (27), Holland (18), England (15), Russia (6), the United States (3) and other countries (Ishizuki, 1972, p. 104).

In deconstructing the semi-feudal Tokugawa ancient regime and constructing a modern Japan, advanced technology was not only what Meiji leaders felt was wanting in the country. What drew their attention was the ‘progressiveness’ of Western societies, which, for them, implied civil societies where a sense of individualism and social equality are based. Often in the West, the term modern is associated with the advancement of technology and the construction of democratic and equal society (Bendix, 1967). In this regard, Meiji leaders were clear-sighted that becoming modern and being recognized as such by the Westerners was imperative for the Japanese State to claim its legitimacy and to enforce its political independence against them. Arinori Mori, a former *samurai* student in England and America, and arguably the most influential Minister of Education (1885–1889) in Meiji Japan, was a great admirer of those civil societies and their social values. Like some other national leaders in Japan, he was profoundly inspired by Christian faith as well. What those *samurai* students saw in Western societies greatly influenced the blueprint of Meiji educational policy. In the government’s inspection voyage to the West, the top envoy noted in 1871 that:

Nothing is more important than schools for improving social conditions and uprooting social evils. [A sound national foundation] depends on education, on education alone. ... Our people are no different from the Americans or Europeans of today; it is all a matter of education or lack of education. (Kume, 2002, p. xiii)

Meiji leaders were also far-sighted in maintaining that ‘things outside the schools would matter and govern things inside the schools’. Since this stage, the government and educators in Japan, to different extents and from different approaches, had tried to reflect the social values of Western societies upon the educational ideas and system of the country. Especially from the late nineteenth century until the middle of the twentieth century, drastic changes took place in education through the absorption of ideas and systems which were, strictly speaking, foreign to the country. For the Japanese government and educators, a major purpose of studying foreign countries was to build a country of an acceptable approximation to the modern State, industrial technology and civil society in American or European terms. The kernel of the State legitimacy and the national pride was winning the recognition of Western countries as a country with those qualities.

In line with this idea, Tokyo Imperial University started as a remarkably international institution in the country with 24 Western professors (43% of the total). The government directed that higher education had to be given through foreign tongues, and a good command of Western languages was an elite factor in Japanese higher education (DoE, 1876, p. 26; DoE, 1893, p. 112). Studying in the West became central to career development in the Japanese academe. Professors and students in other Imperial Universities too received governmental funding for their study abroad. Through these institutional windows to the West, the national academic elite were equipped with ‘advanced knowledge’.

Since then, the theme of counter-balancing attraction to the West and exclusive pride in ‘self’ has been recurrent in the politics and education of the country. In the Meiji period, Japan’s learning curve had made drastic strides along with the growth of the economy, the military and a sense of national pride. Eventually, those foreign professors were replaced by Japanese returnees from the West, and the Japanese language became exclusively dominant in instruction in the university. Since then, for the most part the Japanese academe has remained practically monolingual. In the so-called ‘catch-up’ processes, there could be seen a sense of superiority to Asian countries. Prominent educators advocated that a modern Japan should detach itself from its ‘old Asian ill-fated friends’ such as China and Korea (Fujita, 1995, p. 33). To the Western audience, the government proudly introduced Japan’s achievement in the Philadelphia International Exhibition in 1876: ‘Learning is ... to be equally the inheritance of nobles and gentry, farmers and artisans’, and ‘Males and females are admitted without distinction’ (DoE, 1876, pp. 20–22, 125). It was important for the Japanese to show a credible face of modern Japan in the mirror of Western civilization.

On the whole, education had operated mainly as political, social and cultural benchmark of the national development until it became ‘science’. Therefore, within the context of the construction of a modern Japan, her steep learning curve continued for the ultimate sake of the national defence. The dominant theme of ‘progress’ continued to be sought within education outside the country. Europe and America had long been the teachers of Japan until its economy superseded theirs in the 1980s. Even after, or because of, Japan’s defeat by the United States in the Second World War, this political and academic inclination remained powerful.

The Linearity of Social Development and the Notion of Science

The demise of the nationalist Emperor State reinforced the Westward direction of the Japanese academe. There was also a growing aspiration for the reconstruction of democratic societies in the post-Second World War world. Both Japanese and American educators undertook the drastic reform for the democratization of Japanese education by recognizing a democratic Japan as crucial not only for Japan itself but also for the Asia-Pacific region.

Apart from the education reform as such, the US occupation has left influence on the development and direction of the post-war Japanese academe. During the occupation,

prominent Japanese educators supported the US authority in rewriting the educational ideas of pre-war Japan. This cooperation offered by the Japanese was enormously useful for the US authority and, to the surprise of the United States itself, far-reaching (Shibata, 2005). Tokiomi Kaigo, for example, worked with the Americans for screening and rewriting school textbooks. Mantarou Kido too played a leading role in the Japanese Education Reform Committee, which, according to a US official's memory, 'more than any other agency, including the Occupation itself, had brought about the achievements in Japanese education' (Trainor, 1983, p. 119). Many of those Japanese who created the basis of Japan's new education had exerted professional authority in the post-war Japanese academe.

Masunori Hiratsuka was a student who had cultivated his intellectual capacity with young Professor Kaigo in Tokyo Imperial University from the pre-war period. Hiratsuka eventually became the leading founder of the Japan Comparative Education Society (JCES, initially called the Comparative Education Society in Japan). Born in a clergyman's family, he was inspired by Pestalozzian pedagogy. He often claimed strong Christian influence on his commitment to education. Hiratsuka's devotion to comparative education was also largely based on his earlier missionary schooling (Hiratsuka, 1975). His undergraduate work at Tokyo became a book, *Kyuyaku-seisho no kyoiku-shiso* (The Educational Philosophy of the Old Testament). And another one of his works, *Nihon Kirisuto-shugi-kyoiku bunka-shi* (The Cultural History of Christian Education in Japan), drew the attention of the US occupation authorities, and was translated by them into English. As a professor of Kyushu University and later the director of the National Institute for Educational Research, Hiratsuka operated these two institutions as the pioneer and centre of comparative education in Japan. His achievements have been commemorated by the JCES in the Hiratsuka Award from 1990.

Coinciding with the foundation of the Comparative Education Society in North America in 1956, more studies of foreign education began to take place than before in Japan as well. The chair of Comparative Education was first established at Kyushu in 1952. Hiroshima, Kyoto and Tokyo followed suit. The JCES started with 94 members in 1965 (827 in 2005). In 1975, the Society first published its own journal, *Nihon Hikaku-kyoiku-gakkai Kiyou* (renamed *Hikaku-kyoiku-gaku Kenkyu* in 1990), under the editorial board headed by Tetsuya Kobayashi at Kyoto.

Despite the steady growth of the Society, this field of study did not win a proper academic recognition in the Japanese academe. Comparative educationists put up with a marginal reputation as 'experts' on other countries. In general, the study of comparative education was thought to offer a merely descriptive summary of foreign educational affairs or to be used as an excuse for scholars' travelling abroad (Ikeda, 1975). Indeed, a lengthy work of a 10-volume series written by those who shared interest in foreign education, *Sekai no kyoiku* (Education in the World) showed largely the description, and not analysis, of educational policies and systems abroad (Kido *et al.*, 1958). Scholars in comparative education were aware of the reputation, the practices of this kind, and the problems they had to deal with. The JCES put as its prime aim at the first conference in Hiroshima: "How to introduce comparative education into university education". Since then, the Society has striven to make the field of study as an academically authorized

subject of university study. The Society thought that it would not be possible to deal with the 'low level' of work in comparative education, without having established its own 'methodology' (Ikeda, 1975). In this period, it was accepted in Japan and elsewhere that educational research joined 'science'. Kido stated that the purpose of the research is to 'know the facts' (Kido, 1958). However, such popular debates on science and methodology themselves did not make an innovative development in Japan. There, the studies concentrated on the introduction of the theories and methodologies of Hans, Kandel, Bereday, King, Holmes and others (Ando, 1965; Ikeda, 1969). By doing this, despite the growing attention to this study field in the post-war world, comparative education as an academic field in Japan had not surpassed the infantile stage (Suzuki, 1958).

Nonetheless, within comparative education circles around the world, the JCES as an organization had grown solidly and became a founding member of the World Council of Comparative Education Societies (WCCES) in 1970. In 1980, the Society by itself managed to organize the 4th WCCES Congress in Tokyo. The main theme of the Congress was 'Tradition and Innovation in Education'. In reference to this main theme, 'Moral Education' was also put up as a sub-theme. In post-war Japan, educators have hardly been able to discuss these issues, such as 'tradition' and 'moral education', without failing to recall pre-war 'wrong' education and its denial by the United States after 1945. As Japan's new education started by denouncing pre-war education which had long been controlled by the Emperor State, the power of the State remained as the dominant theme in practically all fields of educational study in the post-war period. For the Japanese in general, these issues are reminiscent of pre-war ethnocentric nationalism, and, for some people, are a potential for its resurgence. The themes of the Tokyo Congress reflected the Japanese preoccupation with this discussion. It was especially strong before the end of the Cold War, but has never been forgotten.

There was also a legacy of the war and the occupation in the development of comparative education in Japan. By the 1980s, Japanese industries have grown in capitalist ways, well enough to alarm the United States itself who had pushed Japan in this line after the war. While the American leaders were feeling their 'Nation at Risk', Japan had achieved a major position in the economy in the world, in particular in the Pacific Rim. It was broadly assumed that the pattern of education and human resource application in Japan was a strong basis for its 'miraculous' success in developing the industries and the national economy (Asian Development Bank, 1991). Structural-functionalists also suggested that economic growth would be contingent on the stock of human capital, and the quality of human capital would depend on that of education. In the 1980s, Japanese education had attracted a great deal of attention from around the world (King, 1986). Along with other 'centres' of comparative education, Tokyo earned the privilege of being a World Congress organizer after London (JCES, 2004).

At the same time, the 1980s was also a period when Japan was expected to make larger contributions to the international community than before. The Ad-hoc Education Reform Council (1984–1987), summoned by the Nakasone Cabinet (1983–1987), called for the internationalization of the school and the university in Japan. Based on the governmental plan of '100,000 Foreign Students' in the Japanese campuses, they accepted an increasing number of overseas students. Accordingly, 'international education' became popular, and courses with name of this kind or alike were rapidly

installed in the university curricula. As of 1993, 168 courses on comparative international education were offered in 62 universities and 3 research institutions throughout the country (Umakoshi, 1996).

Given the Japanese position in politics, economy and education in the world, the Japanese eyes were beginning to shift, not literally but culturally, from the West to the East. With the growth of Japan's monetary contribution to international institutions, a larger number of positions than before became available for the Japanese to take up. In this context, along with the government, educators also regarded offering Japanese experience as a model as important and useful, in particular, to developing countries. Although themes and panels on Western education were still dominant in the JCES conferences, there could be seen a burgeoning of those on Asia from the late 1970s (JCES, 2004). From this period, this eastward tendency has remained in comparative education in Japan. It is characteristic that all the books which deserved the Hiratsuka Award (the 1st in 1990 until the 15th in 2004) were on Asia, except for one volume on Germany and the other one on Australia.

Overall, then this interpretation of Japanese education owes many insights to the intellectual tradition of comparative education developed in Europe. Firstly, the Japanese learnt that it was important for the State to take the lead in educating the people to establish its own model. This way would lead the country to its political and social stability, its economic prosperity and its security. They also learnt that it was important and very useful to inspect other models. This way would enable the government and educators to know what would be 'better' or what would be more 'advanced' education. And data and their systematic presentation would help the proving of this view.

Indeed, comparative education is a modern project (Cowen, 1996). The Japanese have pursued the aspiration of the ideas of 'liberalism', 'democracy', 'civil society', 'science' and 'development'. Although the belief of the Japanese in these values has elevated their steep learning curve, the chasing of these ideas and the belief as an academic act appeared to be linear and not complex enough. A strong focus on data collection, concentration on descriptions and the simple aspirations of positivism, what can be called the practices of 'an error in *episteme*' (Cowen, 1999; Cowen, 2002), have long been addressed as problems in Japan too. Nonetheless, they seem to have not been seriously grappled with. In dealing with demands for new 'knowledge', this field of study in Japan is seen as incapable of overcoming its anachronism (JCES, 2004). It is still a modern project. Perhaps it has missed an old theme, education as cultural practices. For sure, adherence to the linear notions of social development and knowledge will not be helpful to come to grips with the changing pattern of formal education in a globalising world.

Conclusion

What is interesting (among other things in these juxtaposed accounts) is the way in which there is a mix of comparative education as action and comparative education as a way of thinking. Of course these motifs can be found almost anywhere (as for example in the United States or in France) but the dramatic histories of modernization and re-modernization in China and Japan make the motif there very complex.

What is also quite fascinating is the way in which the politics of war and revolution affect what is seen as ‘comparative education’. These potential histories are different from the changes marked by shifts in schools of thought, of disputes about method, and struggles over the decline and fall of departments or journals which are so much part of the literature about ‘comparative education’ in northern Europe and northern America.

Thirdly, on the basis of these accounts (juxtaposed above), a fascinating motif for future research is the question: what happens when the link between comparative education and the State is visible and strong? How does the State as a comparative actor begin to affect comparative education as a way of thinking (and vice versa)? Maybe there is *no vice versa*.

Thus, there is a final and permanently relevant question to be raised also, which in one way, subordinates all of the themes above. For future work, one of the most important single questions to ask is: Through which lenses or (in a different vocabulary) through which categories of description, may an interpretation of comparative education in East Asia be built?

Notes

1. 1990, the journal ‘Foreign Education Trends’ of Beijing Normal University was replaced as the journal of the Society and later changed its title to ‘Comparative Education Research’ in 1992.

NATIONAL CULTURAL IDENTITIES, DISCOURSE ANALYSIS AND COMPARATIVE EDUCATION

Eleftherios Klerides

Introduction

The notions of nationhood and cultural identity have long been fundamental motifs in Comparative Education (CE) (Mason, 2006; Ninnes & Burnett, 2004; Tikly, 1999). In the literature that the field has produced since at least the turn of the twentieth century, they appear either as underlying assumptions or as objects of study. They are an important part of the working professional and intellectual capital of comparative educators, to the point that they are said to be amongst the “unit ideas” of the field (Cowen, 2002a; Cowen, 2002b).

In recent times, Cowen (2002b, 1996) has called for a rethinking of how to treat these unit ideas within CE. The necessity to renegotiate them is part of a wider call for re-imagining the field in the new millennium (Ninnes & Mehta, 2004; Kazamias, 2001; Crossley, 2000; Broadfoot, 2000; Watson, 1999). Such a call is believed to be mandated by a changed or changing world, in the words of Kazamias (2001, p. 439), “the new *cosmos* of late modernity” and notably, by what is seen as a pressing need to incorporate into comparative educational research the complex new views of identity, culture and nation that have emerged or are emerging not least through post-structuralism, postmodernism and post-colonialism (Ninnes & Mehta, 2004; Ninnes & Burnett, 2004; Cowen, 2002b; Tikly, 1999).

Even if the world has changed or is changing, it does not necessarily mean that older perspectives on these unit ideas should be automatically dismissed. Their renegotiation does not imply developing an ahistorical thinking. Rather, the practice of their redefinition should be viewed “as one of consolidation and maturity that builds cumulatively, confidently and critically upon past achievements” (Crossley, 2000, p. 329). Hence, historical interpretations of these concepts in the field should be reviewed to assess which ideas can be kept, which should be readapted and which should be discarded.

This chapter seeks to contribute towards the re-conceptualisation of these unit ideas in CE through a critical engagement with both the traditions of the field and the new views of nationhood and national identities. It starts with an analysis of the historical literature of the field, seeking to sketch how these concepts were construed and what implications did their understanding carry for the study of education across settings.

This is followed by an outline of the emergence of new perspectives on identity and nation in other fields of study such as Cultural Studies, Sociology and Sociolinguistics. It is argued that these new perspectives make urgent a rethinking of how CE appreciates these notions and that a new agenda for comparative educational research arises out of their re-articulation. It is then suggested that discourse analysis is a helpful approach in putting into practice the new research priorities and in reaching new complexities in understanding identity formation in school practices. The main argument being forward here is that discourse analysis can be *a theoretical and methodological bridge in the study of identity and nationhood across cultural settings*. The chapter finishes with a call for looking beyond economic aspects of education and globalisation into a cultural and historical motif of analysis reinvented, however, along the lines of the new emancipatory views on nationhood and cultural identity.

Nationhood and Cultural Identity in the Comparative Education Canon

The notions of identity, nation and culture, and their study in different settings have always been a central theme in a particular strand of CE. For example in the work of Kandel (1933), Mallinson (1975) and Schneider (1966), there was the idea of “national character”. Hans (1958) also stressed through his “factors” (notably race, religion, language and political philosophies), an extended concept of national culture and identity. A cultural framing also characterised the Sadlerian dictum that “the things outside the schools matter even more than the things inside the schools” (Sadler, 1964, p. 310).

Underpinning this early historical literature of the field was a certain cluster of claims about the nature of nationhood and national identity. These were often perceived as natural and objective entities, existing “in the very nature of things”, to use Gellner’s terms (1983, p. 48). This assumption is reflected in the literature as a tendency to write and talk about these concepts in terms of an organicist and naturalist wording. One example of this tendency comes from Hans. He distinguished between “immature” and “mature” nations, and drew an analogy between national communities and human beings as follows: “The growth of nations can be compared with the growth of an individual” (Hans, 1958, p. 11). The parallelism between a national group and a human being is also manifested in the work of Kandel who also ascribed to each and every nation characteristics and qualities that are similar to a person. Nationality, he writes, “is for a people what personality is for the individual, the expression of its life and culture” (Kandel, 1933, p. xxiv).

There was also a tendency in this literature, notably in the work of Mallinson (1975), to make nationality equivalent with such terms as “national consciousness” and “national feelings”. This terminology reveals the way in which he and other comparativists thought about identities – they were inner and innate essences. This thinking is particularly dominant in their views on the notion of “national character”. Mallinson, for instance, defined it as a “fixed mental constitution”, a determinant of a nation’s behaviour rather than a form of national behaviour. He also ascribes its origins “to the existence of a number of relatively permanent attitudes – to these prime

values – common to a nation” (1975, p. 14). In his writings on the concept, Kandel, recognising the danger of generalisations, defined it as a strong possibility towards collective behaviour in specific ways. As he put it, “certain groups are likely to act in ways different from other groups according to their history, traditions, environment, ideals, and intellectual outlook” (1933, p. 23). Even so, he could not also escape essentialised generalisations such as “the Englishman dislikes to think or formulate plans of action” and “the Englishman, more than any other national, believes that an ounce of practice is worth a pound of theory” (1933, p. 25).

The above statements also highlight a specific reading of *cosmos*. In the eyes of these comparative educators, the world was inevitably and fatally organised into a league of unique and independent nations, each with its own distinct identity, culture and destiny in the world. The work of Mallinson is also indicative of this reading. He wrote that each and every nation was “master of its own fate, owing no obedience to any power above or outside it, and free to determine itself as it best thought fit” (1975, p. 265). In the literature studied, however, there was no consensus on what constituted a nation or a national identity. On the contrary, comparative educators often defined them on the basis of a range of combinations drawing upon ethnic and civic criteria. Nationhood were said to be determined by ethno-cultural elements such as a common language, a common religion, collective historical experience, a shared set of traditions and customs or a common descent; or, by such political-territorial features as a common territory, a body of civic values and aspirations common to all citizens or a *patria* of common institutions and laws.

The essentials of cultural identities and nationhood were further understood as being there from birth, unified and continuous, changeless throughout all the changes, eternal. To cite Mallinson again, national character was described as “the totality of dispositions to thought, feeling and behaviour peculiar to and widespread in a certain people, and manifested with greater or less continuity in a succession of generations” (1975, p. 14). The illustrations from his work can be multiplied – the identity of a society “is the total way of life of that society” and “comprehends all that is inherited”; “is an expression of continuity, an awareness of an extension of people in time, in numbers and in space”; and “is based on long continued uniformity of customs and manners” (Mallinson, 1975, pp. 7, 263–264).

To sum up here, the notions under discussions were seen in this early comparative literature as essential, homogenised, fixed and everlasting entities. Their specific conception is a manifestation of the colonisation of CE by the so-called primordialist and perennialist paradigm on the study of nationhood and nationalism (Özkirimli, 2000; Smith, 1999). In turn, this reading of national identity and nation produced and legitimised: (a) certain views on the nature of education and its purposes; (b) how national systems of education and educational knowledge were shaped; and thus (c) a certain kind of comparative education with particular research emphases and priorities.

Since the nation and identity were viewed as essential units, they were in turn seen as existing *independently from* school practices; and if they existed *before* these practices, a national system of education was nothing more than their *mere reflection*. The following statement taken from Kandel is illustrative of this point: “each national system of education is characteristic of the nation which has created it and expresses

something peculiar to the group which constitutes that nation” (1933, p. xxiv). Hans echoed Kandel by stressing that education systems “are the outward expression of national character and as such represent the nation in distinction from other nations” (1958, p. 9).

Thus, the main purpose of national education was to protect, preserve and hand on the so-called cultural inheritance of a nation, and by means of this heritage, to foster a sense of national belongingness among citizens and to assure the cultural continuity of the nation. An example of this line of thought comes from Mallinson. “It is through the education of the immature that each society strives to protect and perpetuate its traditions and its aspirations” (1975, p. 8). Kandel likewise spoke of education in terms of “the transmission of the cultural inheritance which has been regarded as necessary for the preservation of society” (1933, p. 365). In this view, education was an institution where the nation’s children were assimilated into national culture and learned how to *be* nationally. This form of national socialisation was based on the assumption that children were already ethnic subjects, but the fuller realisation of that was to be achieved through national education.

Since they were construed as given entities, national mentalities, traditions and their historical trajectory tended to be dealt with in CE as “the things outside the school” (Sadler, 1964, p. 310), “the intangible, impalpable, spiritual and cultural forces” (Kandel, 1933, p. xix) or the “factors” (Hans, 1958) that affect the shaping of education. Formulated differently, the forces and factors’ school of thought approached cultural context and the history of cultural context in which education was embedded in terms of a causal narrative (Cowen, 2002a; Kazamias, 1961): they were the ‘determinants’ and ‘causes’ of certain forms of national educational systems and knowledges.

Hence, as a mode of research and an approach to knowledge, CE under the impact of nationalist claims of primordialism and perennialism was envisaged as a multi-disciplinary *episteme* devoted to the study of education within its wider cultural and historical context (Kazamias, 1961, 2001; Cowen, 1996, 2002a). This point is perhaps best illustrated in the work of Mallinson. He defined comparative research and study in education as “a systematic examination of other cultures and other systems of education deriving from those cultures in order to discover the resemblances and differences, the causes behind resemblances and differences, and why variant solutions have been attempted (and with what result) to problems that are often common to all” (1975, p. 10). This epistemic strand of the field tried to specify the cultural contexts that are always relevant in shaping all educational systems and all educational knowledge. It was, however, on the margin of mainstream CE, which was mainly preoccupied with the modernisation and development of educational systems within a broader functionalist and positivist approach (Kazamias, 2001; Cowen, 1996).

In the mid-1970s and early 1980s, there was a shift in the field (Kazamias, 2001; Tikly, 1999; Cowen, 1996). It concerned itself with colonialism, neo-colonialism and cultural imperialism, examining educational patterns in former colonies from a dependency theory perspective. Within this paradigm (Carnoy, 1974; Altbach & Kelly, 1978; Watson, 1982), comparative research in education focused on, amongst other things, the specification of the forms and contents of cultural identities created by school practices across colonial settings (Cowen, 1996), but being concerned mainly

with economic facets of underdevelopment “did not lend itself easily to an analysis of issues of race, culture, language and identity” (Tikly, 1999, p. 609). Nevertheless, what was common in all work produced during this period was the sociological view of education as a mechanism for cultural reproduction. The most explicit manifestation of this tendency in CE is the volume of Brock and Tulasiewicz (1985), in which the concept of “cultural identity” was used to explain the role of education in reproducing cultural norms. In the introduction of this volume, the editors write about this notion: “The cultural identity of the group is kept up by constant reference to the reservoir of its culture” and “is born of a common heritage” (pp. 3–4).

Though forms of identity within education became now units of comparative analysis, the notions of identity and nation, as the last statement above highlights, were still perceived as essential and fixed entities (Ninnes & Burnett, 2004; Tikly, 1999). As a result, this new body of comparative literature took the modernist categories ‘coloniser’ and ‘colonised’ for granted – and reproduced and perpetuated them. It treated the relationship between these categories unproblematically and necessarily as one of omnipotence, neglecting to examine the effects of colonialism on the identities of colonising nations. It also gave little attention to heteroglossia, antinomies and tension regarding identity formation within both the colonial and the metropolitan settings; to cultural resistance by colonised peoples to imperialist cultural plans and cultural hybridity as a result of these struggles; and, to fragmentation of colonial experience along gender, class, ethnic and other lines. That is, it failed to examine exactly all the issues which are now considered to characterise notions of national identity and nationhood.

New Perspectives on Nation and Identity

In the second half of the twentieth century, a number of influential works (Kedourie, 1960; Gellner, 1964; 1983; Anderson, 1983; Hobsbawm & Ranger, 1983) appeared in the fields of political science, history and sociology, signalling a shift in the study of nationalism: “from a primordialist, essentialist notion of the nation to the currently dominant view of the nation as constructed or invented” (Eley & Suny, 1996, p. 6). Some scholars (Smith, 2001; 1999) speak of this shift in terms of the emergence of a new paradigm of explaining the nature and origins of nations – the so-called modernist paradigm, which apart from the thesis of the social constructedness of nationhood, advocates their modernity. Others (Hall, 1992) see this shift as the beginnings of the emancipatory process of deconstructing national cultures and identities.

More recently, during the 1990s, a new set of approaches (Bhabha, 1990; Hall, 1992; 1996b; Billig, 1995; Woodward, 1997; Wodak *et al.*, 1999) appeared. These postmodern and post-colonial accounts do not represent a distinct explanatory category of the nation but they employ a constructionist mode of thinking to back and operationalise the modernist arguments (Smith, 1999). For Eley and Suny (1997), these recent methodological approaches and techniques have moved the study of nationhood and nationality into “the realm of discourse and the generation of meaning” (p. 6). Specifically, they attempt to explain *how* nations and identities are socially constructed in two senses: (a) what

particular means and devices are employed to construct them and (b) what elements constitute the meta-narrative of the nation. It is the task of the following paragraphs to provide an account of these most recent developments in the study of nationalism.

The point of departure of the discussion is Anderson's thesis of nations as "imagined political communities". For him, each and every nation is necessarily imagined because it stretches beyond immediate experience – it embraces far more people than those with which nationals are personally acquainted and far more places that they have visited. As an abstraction, the nation is imagined as finite, bounded, autonomous and horizontally uniform:

The nation is imagined as *limited* because even the largest of them, encompassing perhaps a billion living human beings, has finite, if elastic, boundaries, beyond which lie other nations. ... It is imagined as *sovereign* because ... nations dream of being free, and, if under God, directly so. ... Finally it is imagined as a *community*, because, regardless of the actual inequality and exploitation that may prevail in each, the nation is always conceived as a deep, horizontal comradeship (Anderson, 1983, p. 7).

Similarly, national identity can be conceived as a mental construct - one that creates a sense of solidarity among a group of people by promoting the notion of being part of and sharing a common image; a construct that stresses the bound-ness of this image, providing an imaginary unity against other peoples that exist beyond its frontiers and from whom the group is felt to be autonomous; and, a construct that is conceived as unity, concealing actual divisions and heterogeneity within the national boundaries.

The re-reading of nations and identities as imagined is not a denial of their reality and material effects. Rather, it is a recognition of the fact that they are contingent upon human practices, being constructed in and out of interaction between human beings and their world. Hence, nations and nationalities, in Anderson's words, "are to be distinguished not by their falsity/genuineness, but by the style in which they are imagined" (p. 6).

Like Anderson, Hall also points out that identity is imagined as a form of solidarity. He goes on to suggest that this is achieved through "a discursive device which represents difference as unity or identity" (Hall, 1992, p. 297). Thus, however different the members of a nation may be in terms of class, gender, region, ethnicity, age or race, this device-identity depicts them all as sharing the same features and belonging to the same national family. This means that the unity, which every national identity treats as fundamental, is not a natural but rather an imaginative structure of solidarity accomplished through the exercise of certain forms of symbolic power.

Although diversity within the nation is often repressed and backgrounded in national identities, international differences tend to be foregrounded and emphasised (Woodward, 1997; Bauman, 1997; Hall, 1996a; Hall, 1996b; Billig, 1995). Hence, any identity is about imagining the national Self as much as imagining the national Others. As Hall (1996b) puts it, "there is no identity that is without the dialogic relationship to the Other. The Other is not outside, but also inside the Self, the identity" (p. 345). From a post-structuralist perspective, the presence of otherness in national imaginings

is critical in constructing national sameness: “[I]t is only through the relation to the Other, the relation to what it is not, to precisely what it lacks, to what has been called its *constitutive outside* that the ‘positive’ meaning of any term – and thus its ‘identity’ – can be constructed” (Hall, 1996a, pp. 4–5).

If nations and national identities are an imaginary complex of ideas containing at least the defining elements of unity and difference then the image is real to the extent that citizens are convinced of it, believe in it and identify with it emotionally. The issue here is how the imagined community reaches the minds of those who are convinced of it – it is conveyed *and* constituted in *representation*. Indeed, according to Hall (1992), nations are not only political formations but also systems of cultural representations. It is via these systems that a people represent, interpret and produce knowledge about themselves:

[N]ational identities are not things we are born with, but are formed and transformed within and in relation to *representation*. We only know what it is to be ‘English’ because the way ‘Englishness’ has come to be represented, as a set of meanings, by English national culture. It follows that a nation is not only a political entity but something which produces meanings – *a system of cultural representation*. People are not only legal citizens of a nation; they participate in the *idea* of the nation as represented in its national culture. A nation is a symbolic community and it is this which accounts for its power to generate a sense of identity. (Hall, 1992, p. 292)

Bhabha (1990) points out that a mode of representation which has been used to produce and circulate the image of the nation is *narration*. “Nations, like narratives,” he writes, “lose their origins in the myths of time and only fully realise their horizons in the mind’s eye. Such an image of the nation – or narration – might seem impossibly romantic and excessively metaphorical, but it is from those traditions of political thought and literary language that the nation emerges as a powerful historical idea” (p. 1). In a more recent account, Benwell and Stokoe (2006) emphasise the same point by writing that “the practice of narration involves the ‘doing’ of identity” (p. 138). This perspective is often related to the notion of “narrative identity” seen as the identity of a character – the national Self – in a story (Wodak *et al.*, 1999; Martin, 1995). The quintessence of such an identity is that the nation draws its identity from the story’s plot rather than being described in it.

In all scholarly accounts highlighting narratives as sites of identity work, there is also an emphasis on the multiplicity of identities. In the words of Özkirimli (2000), “different members of the nation promote different, often conflicting, constructions of nationhood” (p. 228). Hence, “there is no single narrative of the nation” (Özkirimli, 2005, p. 169). Yet, the idea of multiple identities does not simply refer to the articulation of different narratives by different social groups. It also refers to the construction of diverse narratives according to the sort of social communicative occasion that they are told and to the historic and institutional location of their narrator(s). The view of identities as situational entities is best captured in Wodak and her colleagues’ formulation that there is “no such thing as *one* national identity. We believe rather that different

identities are discursively constructed according to audience, setting, topic and substantive content” (1999, p. 4). The various versions of national identity in a given society are in relationships of appropriateness and in relationships of complementarity, translation, opposition and exclusion.

Several implications for theorising identity and nation can be highlighted in relation to this plurality thesis. First, their construction may be seen as a contested process and these concepts themselves as *terrains of contestation* (Özkirimli, 2005; Smith, 1999). Second, they are marked by *fragmentation, contradictions and hybridity*. They are made up out of partial and diverse narrative fragments, of the Self and the Others, that frequently pull in different directions. Thus, for Martin (1995) “the Self is a mixed body” (p. 17); for Hall (1996a) cultural identities are “fragmented and fractured” (p. 4); for Calhoun (1997) nations are “heterogeneous objects of analysis” (p. 21); and for Bauman (1997) every group identity is “a *palimpsest identity*” (p. 53). Third, identities are *ambivalent* entities and there are various kinds of ambivalence. Bhabha (1990) advocates that they oscillate between tradition and modernisation. According to Hall (1990, 1992), they are ambiguously placed between past and future, belonging to the future as much as to the past. Billig (1995) speaks of the tension between the particularistic and universalistic claims of nation. In his various works, Smith (2003, 1991) finally suggests that they fluctuate between reality and fiction, culture and politics, inclusion and exclusion.

Identities, moreover, change shape not only *in space* across social fields, institutions and occasions, but also *over time*: “national identification and what it is believed to imply, can change and shift in time, even in the course of quite short period” (Hobsbawm, 1992: 11). Similarly, Bauman (2004) sees identity “as an *as-yet-unfulfilled, unfinished* task”, a concept that “was destined to remain not just perpetually unaccomplished but forever precarious” (pp. 20–21). Hall (1996a) also speaks of identity as a formation in a state of constant flux and identity construction as “a process never completed – always ‘in process’. It is not determined in the sense that it can always be ‘won’ or ‘lost’, sustained or abandoned” (p. 2). Hall further stresses the point that changes in the shape and form of an identity are always associated with “its determinate conditions of existence”, including material and symbolic resources.

If national identity is now seen as the product of narrative representation, the issue is what is “the cluster of ideas and understandings that came to surround the signifier ‘nation’ in modern times” (Suny, 2001, p. 870). It is suggested that a narratively constructed identity contains *four* main elements.

The notion of a *common national space* is the first pillar. “A nation is more than an imagined community of people, for a place – a homeland – also has to be imagined” (Billig, 1995, p. 74). The geo-body of the nation is articulated in a range of ways (Smith, 2003, 1986) – as a sacred homeland, a unified entity which starts and stops at demarcated borders beyond which lie other national territories. It is imagined as a historic and ancestral land, a land that spiritually and organically belongs to its people and a people to its land. It is also imagined as a unique, peculiar, beautiful and self-sufficient land, separating what is ‘ours’ from ‘theirs’.

Secondly, there is a *collective national time* in the narrative representation of national identities. “If nations exist in space,” Smith suggests, “they are equally

anchored in time” (2003, p. 166). The national time is often segregated into three sub-elements – *a shared past, present and future*. It is represented as stretching back into the mists of obscure generations of ancestors and forward into the equally unknowable generations of descendants (Calhoun, 1997; Miller, 1995; Smith, 1986). Of these three facets of time, Hobsbawm (1996) privileges the past in the making of nationhood. “What makes the nation is the past; what justifies one nation against others is the past and historians are the people who produce it” (p. 255). In any national historicity, there are a number of recurrent themes – the people’s uniqueness, the superiority of their culture and character, their racial and cultural purity, their longevity, the importance of their autonomy and the negative effects of heteronomy (Berger *et al.*, 1999).

A third aspect of identity is the idea of *a shared national culture*. “Modern man (*sic*) is not loyal to a monarch or a land or a faith, whatever he (*sic*) may say, but to a culture”, writes Gellner (1983, p. 35). Similarly, for Martin, the making of any collective identity implies “a selection of pre-existing cultural traits which will be transformed into emblems of identity” (1995, p. 13). National identity is represented to be the sum of the great artefacts of a “high culture”, as presented in the classic works of literature, painting, music and philosophy and beyond that, to everyday practices which make up the lives of ordinary people – to the widely distributed forms of popular music, art, design and literature, or the mass activities of leisure-time and entertainment (Hall, 1997; Smith, 1991; Gellner, 1983).

The final aspect of the narration of identity is *a common national habitus*. “National identity has its own distinctive habitus which Bourdieu defines as a complex of common but diverse notions or schemata of perception, of related emotional dispositions and attitudes, as well as of behavioural dispositions and conventions” (Wodak, 2006, p. 106). Here, instead of the traditional term ‘national character’, the notion of national *habitus* is preferred on the grounds that it indicates not ‘something’ inherent and eternal, but a set of beliefs or opinions, emotions, attitudes, and behavioural norms that can change from one period to another and that are internalised or individually acquired in the course of socialisation. Hence, a national *habitus* goes beyond stereotypical images about ‘us’ and ‘them’ to include features such as the willingness to take sides with the nation one has a sense of belonging or the readiness to protect it when one feels it is threatened (Wodak *et al.*, 1999).

Thus, to have a national identity, following Billig (1995), is to possess certain banal, prosaic, routinely familiar ways of writing and talking about nationhood – about the national space, the national time, the national culture and the national *habitus*. However, “rather than being *reflected* in discourse, identity is actively, ongoingly, dynamically *constituted* in discourse” (Benwell & Stokoe, 2006, p. 4). Equally, for Wodak *et al.* (1999), “national identities, as special forms of social identities, are produced and reproduced, as well as transformed and dismantled, *discursively*” (pp. 3–4), and for Özkirimli (2005), “nationalism is in this sense a form of discourse, a way of seeing and interpreting the world” (p. 2). This discursive approach to nationalist phenomena is based on structuralist and post-structuralist linguistic philosophy. This theory sees language not as a neutral medium merely reflecting reality, but rather as a means of creating experience, identities and systems of knowledge about the world (Benwell & Stokoe, 2006; Jørgensen & Phillips, 2002; Fairclough, 1992).

This recent reading of identities as inscriptions in discourse has been criticised on the grounds that it tells little about agency, specifically how subjects interact with discourse and how they may resist, modify, negotiate or reject narratives about the national Self (Benwell & Stokoe, 2006). In an attempt to hit a middle ground, Hall (1996a) employs the term ‘identification’, defining this concept as

the meeting point, the point of *suture*, between on the one hand the discourses and practices which attempt to ‘interpellate’, speak to us or hail us into place as the social subjects of particular discourses, and on the other hand, the processes which produce subjectivities, which construct us as subjects which can be ‘spoken’. Identities are thus points of temporary attachment to the subject positions which discursive practices construct for us. (pp. 5–6)

National identity can be similarly conceived as a positional concept. It is a position of identification, the attachment of the subject to what may be called the nationalist subject position. This is constituted by nationalist discourse, either, according to Hall (1992), the discourse of national culture, or, according to Calhoun (1997), the discourse of nationalism. Both discourses have the ‘nation’ or the ‘people’ as their object of signification. Members of a nation identify with this position to which they are summoned and seek to engage or invite others in discourse. “National cultures”, as Hall (1992) points out, “construct identities by producing meanings about ‘the nation’ with which we can *identify*” (p. 293). This premise – the joining of authors and readers in structures of nationalist meaning and conventions – represents a consensus in the literature.

Implications for Comparative Education: A New Research Agenda?

In light of deconstructive views, treating nationhood and cultural identity within CE as essential, unified, eternal and fixed is problematic. Rather, the emergence of these new theoretical accounts makes urgent a rethinking of how the field appreciates the concepts of identities and nations. Their re-negotiation and re-conceptualisation builds on the traditions of the field and is explored here in relation to the nature and function of education, as well as to the way in which educational knowledge is constituted. It is then suggested that a range of new research issues for CE to engage with arises from this re-reading. The intention here is to identify some potential areas for research and to open debate rather than to imply closure.

Since national identities and nationhood are now seen as products of language and discourse, their treatment as existing independently from schooling processes is problematic. From the standpoint of the new theories, signifying practices within education (for instance, the production and distribution of curricula and textbooks, and their consumption in school and classroom), as in other social domains, are not mere reflections of the distinctive character, history and culture of a nation. Rather, they should be viewed as *sites of their discursive construction*. Any educational practice of

signification be it a civics lesson, the reading of a poem, a geography book or a history map, provided that it has either explicitly or implicitly the ‘nation’ or ‘people’ as its privileged object of attention, can be seen as *an instantiation of national identity articulation*. In any such instance, the production of the nation’s image is a historically and socially contingent praxis depending on a number of factors: the topic and the audience to which an instance of identity construction is related, the general features (including purposes) of the pedagogic setting and the education system in which this instance takes place and more generally, the wider society and the historical trajectory of that society in which identity formation is embedded.

Therefore, the role of national education is not so much to protect, preserve and pass on the nation’s cultural inheritance. Instead, the purpose of education, from the point of view of postmodern, post-structural and post-colonial accounts of identities and nationhood, is to participate in the construction and transmission of this heritage to the masses – for example, of the belief in national unification, in the differentiation of the Self from Others and in the singularity of the people, of the idea of national continuity over time and in space, and more generally, of certain types of national subjectivities. Some scholars working for instance in the field of history education have recently begun to address these functions of education (Lowe, 1999; Frangoudaki & Dragona, 1997; Green, 1997), and others to particularly study them from a comparative perspective (Foster & Crawford, 2006; Vickers & Jones, 2005). In spite of these positive developments, there is still a lot to be done, especially in developing the theoretical dimension of this work.

Moreover, the centrality of a culturally contextualised and historical approach to the study of educational matters across national settings – that is, the Sadlerian views that ‘the things outside the schools’ shape and regulate ‘the things inside the schools’, and that education is ‘the outcome of battles long ago’ – should *still* be relevant today for the field. For example, in light of the new views on nationhood and cultural identity, it is expected that constructs of national identity in education are linked to, and influenced by, the articulation of nationhood in other social fields (the political, media, academic), both synchronically and diachronically. The value of contextualisation in the investigation of educational practices and the relevance of cultural specificities in shaping educational forms and knowledge have been also reiterated recently by some scholars working in CE (Mason, 2006; Crossley, 2000; Broadfoot, 2000; Alexander, 2000). Others, the most vocal of them being Kazamias (2001), Watson (1999) and Sweeting (1999), have extended the notion of cultural context calling for the reinvention of the historical in CE.

However, from the position of new conceptions of identity and nationhood, the link between ‘the things outside the schools’ and ‘the things inside the schools’ needs to be reread in terms of a *dialectic*: ‘the things inside’ are *constituted* by ‘the things outside’ but at the same time, they are *constitutive* of them. Therefore, if CE is to take account of the new complexities of identity formation, any educational instance of identity constitution should be now construed as “the insertion of history (society) into a text and of this text into history” (Kristeva, 1986, p. 39). By the insertion of history into a text, it is meant that identity absorbs and is built out of available conventions from a society and its history, being in this way involved in the enactment of continuity with

the past and reproduction. By the insertion of this text into history, it is meant that identity reworks the available meanings of that society, and in so doing, it helps to make history by contributing to processes of change in the image of the national Self.

Moreover, and following again new theories of identity construction, the relation of education with cultural context and the history of cultural context, ought not to be thought of and examined on the basis of determinism – ‘the intangible, impalpable, spiritual and cultural forces and factors’ as ‘determinants’ of educational forms and knowledge. Instead, this motif of the historical comparative literature should be re-conceptualised on the basis of the idea of *possibility* – ‘the intangible, impalpable, spiritual and cultural forces and factors’ as the conditions for articulating certain nationalist narratives and at the same time, delimiting the possibility for other ways of representing and constructing knowledge about the Self. This point will be revisited and further explained later in this chapter.

From a critical engagement with both traditions of the field and new perspectives on identities and nationhood, a number of new priorities for research can be now sketched.

It is necessary for CE to start interrogating notions of nationhood and cultural identity across national settings. The starting point of this process should be an interpretation of these notions as *products of discourse and language*, being materialised in curricula, policy texts, textbooks or classroom practices. A whole range of new research themes emerges from this insight. Of particular relevance are for instance the study of how nationalities are constructed as primordial units, of how nations and cultures are presented as homogeneous, of how continuity and singularity are enunciated, of how distinctions between the Self and the Others are constituted, of how identities are presented as eternal and natural entities. The implication for CE here is to engage in investigations of the ways in which these nationalist ideas (unity, timelessness, uniqueness, difference, and so on) are constructed in different places. Such an approach, one that focuses on *how* rather than *what*, is not a usual practice in CE, and in other educational fields. In the literature, national identities and nationhood are often studied via methods of content analysis which neglect the role of language in constituting content (Oteiza, 2003).

Another area of study is to deepen understanding of how nationalist subject positions are constructed in schooling across cultural settings. This type of analysis can be carried out by identifying and describing issues such as: what kind of knowledge about the national past and culture the nation’s children are given; what types of opinions, emotions and attitudes about and towards the Self and the Others are made available to them; what representations of the nation’s geo-body they are provided with; and, what sense of destiny in the present and future is cultivated in them. It is through identification with particular nationalist readings of time, culture, habitus and space that children ‘become’ certain kinds of national subjects.

If CE is to start examining the making of national subjectivities, then attention also needs to be given in the study of the ways in which pupils are summoned to identify with narratives of nationhood and whether some space is created for them to negotiate, resist, modify or reject national mythologies. This mode of analysis can be extended to cover the ways in which teachers or writers of curricular material themselves are positioned in

relation to discourses about the Self. A crucial implication for comparative research here is to trace and explain possible variations across cultural settings regarding pupils' interpellation and writers' positioning towards nationalist discourses.

Moreover, the 'style', to employ Anderson's (1983) term, in which nations and identities are imagined in different places needs not be examined as coherent and consistent. Rather, it ought to start from the view that it is marked by fragmentation, ambivalence, heterogeneity, contradictions and pluralism, implying that the search for the nature and origins of these features can be the basis of comparison. This implication, as was said earlier, derives from the postmodern and post-colonial axiom that the imagery of the nation is fractured, fluid and hybrid, a point of struggle and contestation, of ambiguity, dilemmas and paradoxes.

The inherent historicity of every national identity, that images of nation are subject to change or perpetuation, implies a need to look at how nationhood is challenged, transformed, sustained or defended across cultural settings. The recent works of Vickers and Jones (2005) on national identity and nationhood in East Asia and Schissler and Soysal (2005) in Europe provide two examples of the application of such an approach comparatively. However, although the contributors in these volumes analyse changing politics concerning nation, they frequently neglect the persistence of older entrenched national myths; and more importantly, the hybridisation of identification deriving from co-articulations of new and older national images. The complex juxtaposition of new and old and the creation of novel hybrids should also be taken into account.

A final area of comparative research addressed here stems from the view that national identity is contingent upon the ideological, political, sociocultural and historical context in which it is embedded and is constitutive of this context in creative or normative ways. Such a view implies a necessity to explore both the role that education is given to shape and transmit certain perceptions of nationhood, and the conditions for the (re)production of certain styles of identities. The examination of the conditionality should seek to capture and illustrate both the uniqueness and the interdependency of cultures. Some of the complex linkages between educational constructs of identity and the broader conditions which they are related to can be revealed by discourse analysis.

Discourse as a Theoretical and Methodological Bridge

This section seeks to show how discourse analysis can be fruitfully used to help CE to operationalise some of the new priorities for comparative study that arise from a rereading of both the traditions of the field and the notions of nationhood and national identity. As a research method and a theoretical approach to knowledge, discourse analysis provides a set of concepts and techniques that are valuable in studying nations and nationalities in a systematic way in different places. It is argued here that the notion of 'discourse' itself can be a theoretical and methodological bridge across cultural settings. Its analytical power lies in that it can capture what is common in different places – that is, the discursive (re)construction of nationhood and national identity – and at the same time, does not gloss over history, culture and difference – “the themes

that make comparative education intellectually interesting” (Cowen, 2002a, p. 419). It also lies in that it builds bridges not only across cultures but also between disciplines, micro and macro levels of analysis, theoretical and empirical study – the themes of “a neo-comparative education” (Broadfoot, 2000; Kazamias, 2001; Crossley, 2000; Bray & Thomas, 1995).

Identifying and Describing Discursive Identities

The ‘styles’ in which national identities are imagined in a range of educational texts (curricula, textbooks, policy documents, teachers’ talk or pupils’ writings) across cultural settings can be identified and described through three interconnected levels of analysis: the level of propositional contents, the level of discursive strategies, and the level of linguistic realisation. This tripartite framework of analysing nationalist discourse derives from a view of discourse as a group of statements about a specific topic whose organisation is regular and systematic (Mills, 2004; Hall, 2001; Fairclough, 1992; Foucault, 1972).

- First, there is the level of topics and propositions. The purpose of discursive analysis here is to reveal the thematic choices of, and the messages encoded in, nationalist discourse. Its contents are organised in terms of the four categories of narrative identity presented and defined earlier – the category of ‘time’, of ‘space’, of ‘culture’, and, of ‘habitus’.
- The second level of analysis is the level of strategies. Following the Austrian strand of Critical Discourse Analysis (Wodak, 2006; Reisigl & Wodak, 2001; Wodak *et al.*, 1999), a strategy is defined as the particular, conscious or unconscious plan adopted by writers or speakers to achieve the aims of constituting and conveying primarily national unity and difference in relation to the categories of time, space, *habitus* and culture. Yet, identity, as was said earlier, is also about the construction of a range of other nationalist notions – the ideas of national continuity, uniqueness, superiority, autonomy, positive ‘self’-presentation and negative ‘other’-presentation, and so forth.
- All these strategies are of a constructive nature – that is, they attempt to enact a certain kind of identity by promoting sameness, difference, continuity, and so forth. There are also strategies of perpetuation (that aim to maintain, defend and reproduce a national identity) and transformation strategies (changing a particular identity and its pillars into another one). All these strategies types stem from a view of discourse as having simultaneously the following functions – constructive, transformational and perpetuating (Wodak, 2006; Wodak *et al.*, 1999).
- There is another cluster of strategies – those of involvement or detachment, and those of intensification or mitigation (Reisigl & Wodak, 2001). The former set refers to how writers or speakers express their involvement in or detachment from a represented nationalist discourse and position their point of view in the discursive flux. The latter set is applied to qualify or modify the epistemic status of a nationalist proposition and to express its commitment to truth. Both sets of strategies are related to the way hearers or readers are summoned to identify with nationalist discourse.

- Third, there is the analysis of the linguistic means and devices which are involved in the expression of contents and strategies. The two layers – contents and strategies on the one hand, and language on the other – “are connected via the process of ‘realisation’: lexico-grammar ‘realises’ semantics, the linguistic ‘realises’ the social” (Benwell & Stokoe, 2006, p. 108). This process, in other words, is based on the idea that content and language forms are inseparable (Fairclough, 2003). A central dimension of the linguistic realisation of nationalist discourse is what may be called the lexicon of nationality. And, as Billig (1995) points out, “the crucial words of banal nationalism are often the smallest: ‘we’, ‘this’ and ‘here’, which are the words of linguistic ‘deixis’” (p. 94). This means that a given nationalist discourse is expected to construct narratives of national time, national space, national *habitus* and national culture, as well as of continuity, difference, singularity, autonomy, in specific ways realised linguistically through specific vocabulary choices.

This tripartite framework of identifying and describing identities, based on the analysis of nationalist contents, strategies and language forms, is illustrated with examples from my own research on national identity and school historiography in Cyprus and England.

The following extract is taken from a Greek Cypriot textbook. It encodes particular readings of the past and present of the Greek community of Cyprus, as well as of its *habitus*, destiny, land and culture. These readings are linked to three strategies – the strategy of stressing continuity, difference and unity – and both contents and strategies are constituted and conveyed via certain linguistic devices:

Many peoples (or groups) made their way through Cyprus or conquer it: Phoenicians, Assyrians, Egyptians, Persians, Ptolemies, Romans, Arabs, Crusaders, Franks, Venetians, Turks and English. However, the inhabitants safeguarded the Greek character which had been formed since the Mycenaeans had settled on the island, at the end of the Later Bronze period; this is evident in the language as much as in the tradition.

The projection of the continuity of ‘the Greek character’ of the population, culturally defined by Greek language and tradition, is prominent here. Two linguistic devices are used to realise the strategy of continuation. First, there is the tense system which gives expression to the comparative loci of difference and similarity. These two loci construct the view of the distant past as the origins of the Greek character of the people, and of the present as the epoch where this character is still evident. Second, there is the conjunction ‘however’ employed to realise the contrastive locus of comparison. This suggests the reading that the people ‘safeguarded’ (a verb carrying connotations of preservation) their character, despite repeated contact with and attempts by ethnically and religiously different peoples to suppress, change or destroy it.

In this excerpt, there is also strategic emphasis on difference and sameness, which is linguistically manifested in group-constituting labels (such as ‘Turks’, ‘Franks’) and the epithet ‘Greek’ (it evokes a Greek unified people). Through these two strategies, both the constitution of the Self and the Others, and their differentiation, are created

by insinuating a symbolic frontier between a Greek world of subjugation, defiance, resistance and struggles, and a non-Greek world of power, conquests, oppression and threats. This division highlights the destiny of the Self in a world of nations – to preserve their Greek character by defending it against Others who tried to change or destroy it. This, in turn, is related to the implied message of Cyprus as a Greek land, both at the present time and throughout history, as well as a specific perspective on the nature and *habitus* of the Self – ‘we’ are a Greek cultural community of shared language and tradition, and of stubborn loyalty to them, including the readiness to fight against powerful peoples for their maintenance.

The categories of ‘discourse content’ are also valuable in sketching the different style in which identities are imagined across cultures, diachronically and synchronically. This is illustrated with the ‘past’. In English histories, two main aspects of the representation of the national past are what I have termed in my analysis ‘the narrative strand of constitutional growth’ and ‘the narrative strand of imperial expansionism’. In contrast, Greek Cypriot histories, as was mentioned above, promoted the past as one of the preservation of Greek culture on the island. The making of the past along Greek lines has dominated school historiography in Greek Cypriot schooling since the first decades of the twentieth century. Following the territorial division of Cyprus in 1974, a new narrative was added to existing patterns. This is ‘the strand of heteronomy and autonomy’ that tells the story of a Cypriot people struggling for physical survival and freedom against great powers.

The content categories can be also important in revealing the motifs of fragmentation, ambivalence, dilemmas and hybridity that characterise the constitution of identity. In English stories, for example, the narrative of constitutional growth promotes a democratic nation, the English first and then the British (after the creation of the United Kingdom), who, with the passing of time have broadened their liberties. In the expansionist narrative, the Self is also articulated in an ambivalent way: there is, on the one hand, the image of a powerful and progressive English nation who had managed to bring their weak and backward Celtic neighbours under English power, and on the other, the image of a civilised and superior British nation who were engaged in a mission to spread civilisation to uncivilised and inferior peoples. Similarly, the co-occurrence of the narrative of Greek cultural preservation and the narrative of Cypriot heteronomy and autonomy in Greek Cypriot histories after 1974 further exemplifies the heterogeneous, fragmented, ambivalent and dilemmatic nature of identity. Each of these two strands promotes a different position of national identification: a Greek position, the narrative of Greek cultural preservation, through which the Self is construed as a Greek people that is an inseparable part of the Hellenic community; and a Cypriot position, the narrative of autonomy and heteronomy, through which the Self is seen as a Cypriot people that is independent and different from the broader community of Hellenism.

Ambivalence and heterogeneity can be also studied through the discursive motif of ‘linguistic realisation’. This is illustrated with an excerpt from an English textbook of 1966, which is also indicative of the persistence of the nineteenth-century Whig construction of the English past as a triumphant and uninterrupted march towards political democracy:

Just as a child grows up to maturity, learning by experience and teaching, so a country must develop its own institutions and ideas, growing through its history into a responsible nation. Some of the lessons are hard, some of the experiences are shattering, like the Civil War in the reign of Charles I, but all play their part. We in Britain have developed gradually towards a country where the law protects our liberties and Parliament represents the majority of our wishes.

In this passage, it is uncertain whether the terms ‘country’ and ‘nation’, the deictic ‘we’ and the possessive pronoun ‘our’ denote the English or the British people. This is the effect of the fact that the text blends together elements from English identity discourse – the Whig historicity manifested, for example, in the episode of the Civil War – and elements from the British identity discourse – the British parliament as the representative of the nation’s will and the British law as the guardian of national liberties. Similarly, the term ‘Britain’ appears ambivalent whether it refers to Britain or England, highlighting the so-called enigma of national identity in England – British or English? (Kumar, 2003). This example also indicates that the aim of discourse analysis to ‘read between the lines’ can only be reached with a combination of detailed linguistic analysis of texts and the explanatory insights from other social disciplines (Fairclough, 2003; Reisigl & Wodak, 2001).

The notion of ‘linguistic realisation’ is also useful in tracing the different formation of identity according to audience and generally, the idea of multiple identities in educational practices of signification. This notion embeds the view that even if a certain proposition or strategy is the same in two distinct instances of identity formation, its realisation in language may differ. One example is the different linguistic realisation of the idea of the preservation of Greek culture and identity over time in elementary and secondary education textbooks. Greek Cypriot stories for elementary school often convey this idea through simple language, for example, by verbs and adverbs denoting continuity and the tense system: “The Cypriots continued to feel love for Greece. This love has never stopped.” The same message is often expressed in secondary textbooks through abstract noun phrases – “the continuation of Hellenism under extremely bad conditions” – or negation: “But, despite all the sufferings the Arabic raids caused to the Greek Cypriots, they had *no* effect on their Greek character.”

Apart from content categories, the analytic category of ‘discourse strategy’ is also a useful tool in uncovering identity shifts. To mention one example, English histories, in light of decolonisation and post-colonial literature, sought to reconstruct the reading of the British imperial past via a strategy of transformation. Consider this extract taken from a textbook section entitled “Changing interpretations”:

For more than fifty years twentieth-century historians agreed with the nineteenth-century view that the British Empire brought the benefits of European civilisation to native peoples. ...

By the 1970s most countries of the Empire had become independent of Britain, some after bitter wars. British historians no longer looked at the Empire purely from the British or European point of view. A. J. P. Taylor pointed out that British rule did not necessarily benefit the people of the Empire.

By means of temporal references, this extract adopts the locus of difference to project two understandings of the relation between empire and native peoples. The first is the nineteenth-century reading (still evident in most parts of the twentieth century) that empire brought the benefits of civilisation to them. The second is the view of the 1970s and onwards that empire did not necessarily benefit them. What links these two historical interpretations is change – from the old certainty that empire was favourable to the colonised peoples into a new view that empire was not necessarily beneficial to them.

The strategies of detachment/involvement and of mitigation/intensification are also of important value especially in examining comparatively the way in which writers or speakers position themselves in relation to represented discourses on nationhood and the way in which hearers or readers are summoned to identify with them. This is also illustrated with examples from my own analysis of school historiographies in Cyprus and England, notably in relation to how stereotypic expressions appeared in textbooks. Consider two extracts:

1. The Irish live like beasts, are more uncivil, more uncleanly, more barbarous in their customs than in any part of the world (in source 4E: an Englishman reporting in Elizabeth I's reign, taken from an English textbook).
2. Processions, honour and dignity, personal liberty, were all effortlessly violated by the Venetians (found in the main narrative of a Greek Cypriot textbook).

In the English textbook, the utilisation of direct reporting with source to give expression to the negative stereotype of the Irish as uncivilised indicates a mood on behalf of the textbook writer to explicitly detach himself from it and to implicitly challenge it in terms of universal truth. At the same time, this detachment strategy mitigates the illocutionary force of the stereotype and its persuasive impact on readers, telling them that this is just an opinion and thus, generating space for them to negotiate it. The Greek Cypriot textbook, in contrast, does not allow much space for the readers to negotiate the stereotype of the Venetians as an autocratic people. It is conveyed as a universal truth (via the simple past) and its illocutionary force is further intensified through the adverb 'effortlessly'. These features also highlight the writer's strategic involvement in the making, naturalisation, legitimacy and perpetuation of this stereotype.

Conditions for Discursive Identity Construction: Contexts of Possibility

Discourse analysis can be also valuable in the comparative study of the conditions within which certain identities are constructed – through the idea of 'context of possibility'. "Discourse", Fairclough & Wodak (1997) point out, "is not produced without context and cannot be understood without taking the context into consideration" (p. 276). Blommaert (2005) further elaborates that the notion of context is to be construed "as *conditions* for discourse production" (p. 66). This position echoes Foucault (1972) who defined this notion as the rules of formation of discourse. For him, context operates as a regime of possibilities, permitting, and at the same time, constraining what can be thought, said and written, in this case, about the national Self. The context, then, does *not* determine the articulation of an national identity, but rather "what enables it to appear, to juxtapose itself with other objects, to situate itself in relation to them,

to define its difference, its reducibility, and even perhaps its heterogeneity; in short to be placed in a field of exteriority” (Foucault, 1972, p. 45).

The reading of context as conditions of possibility regarding the representation and construction of nationhood differs from older approaches in CE to the study of cultural and historical context in two ways. First, it acknowledges the possible existence of a finite variety of positions of national identification based on and derived from different interpretations of and interactions with the context of possibility, by members of a national community. Older approaches, viewing nations and cultures as essential entities, did not accommodate diversity of nationalist imagination. Second, trying to trace conditions of possibility underlying the making of a discourse on nationhood is an activity much less fixed, certain or transparent than the older deterministic arguments. Though it also implies that a range of ‘forces and factors’ are linked with its construction, the notion of context of possibility recognises that the researcher probably fails to grasp all of them, primarily the most ‘insignificant’ but perhaps the most crucial, leaving thus room for conditions yet to be identified. In other words, this concept is more locally sensitive, more inclined to capture the vast complexity of the emergence of a nationalist discourse, and points to the limitations of analysis and interpretation.

Yet, the line between ‘contexts of possibility’ and ‘causes’ or ‘determinants’ is very thin and fuzzy. Larsen (2004), using a similar distinction in her work, notes that ways bringing together these two notions without resorting to determinism must be developed. A fruitful way, perhaps, to resolve this problem would be to look for these contexts in texts themselves rather than arbitrarily decide about them on the grounds of available theories and literature. This suggestion derives from the view that any discourse is defined by its relations with others and by the material conditionality which it is related to (Reisigl & Wodak, 2001; Fairclough, 1992; Foucault, 1972).

One example of how such an interdiscursive approach can reveal the conditions that made the production of a nationalist discourse possible is the shift in the representation of colonial rule in English school stories. As said above, histories of the post-imperial period seek to transform the view that imperial rule brought the benefits of civilisation to colonial peoples into a view that empire did not necessarily benefit them. This means that it was decolonisation and the emergence of new post-colonial histories (upon which textbooks draw) that made it possible for this shift in the making of the national past to take place. An additional condition for national identity reconstruction was the existence of practices of new history in school historiography – notably the belief that history is just a reading of the past which is never definitive but shifts in light of new historical evidence.

A second example also comes from English history textbooks. School stories of the earlier parts of the twentieth century often represented Magna Carta as “the foundation of our liberties” or as the act that “rescued our ancestors from much of the oppressive tyranny of the feudal system”. In both utterances, the possessive pronoun ‘our’ conveys the view of Magna Carta as beneficial to all the English. In contrast, Magna Carta tended to be represented in textbooks of the later parts of the twentieth century as an act which was favourable only to some people: “It was granted to all freemen of the realm (not villeins).” Again, this shift was made possible to occur with the emergence of new history as a paradigm of history teaching and writing as well as of new

academic historiographies in the post-war period, promoting the reading of this act as the foundation of the rights of the higher social ranks of England – not of common people. Thus, new history, new constitutional and post-colonial academic historiographies, as well as decolonisation and the collapse of the British Empire were part of the contexts of possibility for identity constitution in post-imperial English textbooks.

It derives from the discussion above that instances of national identity construction also necessarily position themselves in relation to non-discursive aspects of context. Perhaps this point can be made clearer with an example from a Greek Cypriot textbook. It illustrates exactly how material conditions shape the construction of a particular image of the national present and the destiny of the national Self:

Four years have passed since the coup and the Turkish invasion. The 40% of our land is under Turkish occupation. Four thousands our dead and two thousand the missing persons. Some 200 thousand Greeks have been forced to abandon their houses and belongings and they live as refugees under miserable conditions. Those who stayed behind are being humiliated and are suffering at the hands of the conqueror and with numerous blackmails are also being enforced to abandon the land of their fathers.

Under specific material conditions – the Greek and Turkish military offensives, the territorial division of the island, violent displacement of populations, death and abject social and economic circumstances – the common present is constructed in negative terms, as one of ordeal, occupation, mourning, expulsion and oppression, implicitly conveying an image of the Self as a victimised people.

The conceptualisation of ‘contexts of possibility’ along both discursive and material lines, is indicative that the approach offered here does not align itself with postmodernist reification of discourses as autonomous collusive actors which steer speakers and writers, hearers and readers. Nor does it subscribe to the post-structuralist dogma that there is ‘nothing outside the text’. Rather, it tries to hit a middle ground: discursive practices produce, reproduce, transform and dismantle material aspects of the world just as elements of material reality shape what can be thought, spoken and written (Fairclough & Wodak, 1997).

Conclusion

The emergence of complex new perspectives on nationhood and cultural identity in other fields of study does not merely imply a necessity for a radical rethinking of how CE treats these unit ideas. Perhaps more importantly, it also highlights for comparative educators that they need to broaden their research agenda and particularly to look beyond economic globalisation concerns into non-economic issues including identity, ethnicity, culture, nation, race and gender. This is a call that has been repeatedly stressed in recent times in literature (Kazamias, 2001; Watson, 1999; Tikly, 1999; Cowen, 1996). Here, I would like to extend this call by arguing that it is important to start the study of these non-economic concepts from their understanding as discourses and as products of discourse, and to examine the complex dialectic linkages of their

articulation in educational sites with the wider cultural and historical contexts of possibility in which they are embedded. This chapter illustrated, I hope, that discourse analysis can help CE to carry out these research priorities, and thus, to recapture its concern with two of its older, but largely marginal, traditions – the study of culture and the history of culture.

TIME FOR A SCIENTIFIC REVOLUTION? FROM COMPARATIVE EDUCATION TO COMPARATIVE LEARNOLOGY

Patricia Broadfoot

A New Dawn for Comparative Education?

The scale and reach of this handbook is welcome testimony to the current buoyancy of the field of comparative education – testimony to its intellectual energy, its theoretical reach and its considerable diversity. In recent years, comparative education has moved out of the doldrums it found itself in during the late twentieth century, acquiring both a new clarity of purpose and significantly increased external recognition of its value as an approach. There are a number of reasons for this.

One of the most important has been the willingness of comparative educationists to grasp the opportunities provided by the advent of postmodernist perspectives; to progress from the on-going debates between positivist and humanist perspectives which dominated a previous era in order to embrace the rich intellectual potential of the emerging sociological emphasis on culture and lived experience. Comparative educationists have not shied away from the challenges presented by a more fractured way of looking at the world; nor have they failed to respond to the implications of the seismic changes taking place in the world. Indeed, a great deal of the recent interest in characterizing the field of comparative education has centred on these very issues – as shown, for example, in the twin millennium issues of the journal *Comparative Education* (Crossley & Jarvis, 2000, 2001).

Thus, in place of the previously more typical focus on education systems and policies, national contexts and international surveys, we are increasingly seeing bold attempts to reconfigure the epistemology of the field; to apply hitherto untapped theoretical perspectives; to conceive new units of analysis and to widen the range of building blocks that form its focus such as micro comparative studies of classroom life. In short, as this Handbook convincingly demonstrates, the field of comparative education finds itself in ferment, a bubbling cauldron of new ideas and perspectives that has welled up in response to the significant intellectual challenges of an increasingly globalized world.

But, happy as we should be at this state of affairs, there remain aspects of comparative education that are significantly less buoyant at the present time. Chief among these is the issue of methodology – the rigour of the research process itself. I do not refer to the kind of arcane debates about epistemologies which have long characterized the

field. Rather I refer to the apparently simpler, but yet fundamental, questions concerning how data are collected; how they are analyzed and reported; how they are stored and how they may be made accessible to other researchers and future generations. As Crossley and Broadfoot (1992) have argued, this is an area that has received relatively little attention in the comparative education literature. Yet it is fundamental to the quality of the research that is ultimately produced.

New times present new research challenges. If, as suggested above, there is now a growing recognition among scholars in the field that we need a re-conceptualization of the fundamental building blocks of comparative education, (see, e.g., Alexander *et al.*, 1999), so too, I would argue, it is time for a fresh look at how adequate are the traditional tools of the trade for addressing the new research questions now emerging. It is perhaps not too whimsical to suggest that comparative education is in the process of moving out of a protracted adolescence into young adulthood. Like all adolescents, it has had to meet the challenge of separating from its parent disciplines as part of a process of exploring its own, potentially unique contribution; to endure a time in which it was not sure of its identity, in which it experimented with a variety of different perspectives and approaches; in which it lacked the self-confidence of a mature field. Hence there have been protracted discussions in the literature about 'the state of the art' (see, e.g., Bray, 2003; Watson, 2001) and occasional turf wars between rival orthodoxies.

But, with the advent of explicit recognition of the implications of globalization, Governments are now becoming increasingly hungry for comparative insights. There is, in consequence, an unprecedented opportunity for a significant upscaling of the perceived importance of comparative studies of all kinds. This in turn requires the development of the field's capacity to deliver research that it is adequate in its scope and sophistication to bear the weight of this interest. As always, coming of age brings with it increased responsibilities. Comparative education, like other comparative fields, must be able to deliver research findings that have a broad, international salience; in which the rigour of the process of conceptualization, research management, data-gathering and analysis is both robust enough to withstand politically motivated attacks and yet sufficiently fresh and original that it is able to provide the independent validation or challenge to the status quo that is its *raison d'être*.

So what might be the features of such a sea change in the scale and sophistication of comparative education research? In this chapter I argue the need for two fundamental re-orientations that seem to me to be particularly pressing. The first of these re-orientations is, I suggest, a change in the focus, the epistemological foundation of what we currently term 'comparative education' and the concepts that frame the research questions being asked. The second re-orientation I want to argue for concerns the methodologies which comparative researchers currently employ. Thus in the first part of what follows, I seek to illustrate the need for a radical re-examination of the basic precepts of the field. In the second part of the chapter, I explore some of the exciting new methodological challenges for comparative education that are likely to present themselves in the years ahead if it is to meet the criteria of an 'adult' scientific discipline in the twenty-first century. Together these two sections provide the basis for a concluding section which describes a future in which comparative education has

indeed come of age: an approach to comparative studies that combines the best of an illustrious tradition with a refreshed theoretical orientation and enhanced empirical rigour. These new developments in the field, it is suggested, will in turn underpin the possibility of conducting comparative studies which are both on an unprecedented scale and also have an international impact on conventional thinking about educational delivery.

From Comparative Education to Comparative ‘Learnology’?

Previously, I have criticized the world of education for being slow to challenge the accepted ‘delivery’ model of conventional schooling (as well as now, increasingly, higher education) (Broadfoot, 2001). I have drawn attention to the irony that whilst a surgeon transported from an operating theatre in say 1900 to one in the twenty-first century would find themselves hard put to understand the function of almost all the equipment it contained, a school teacher from that time would feel immediately at home in the conventional paraphernalia of a contemporary classroom. Although slightly unfair, this comparison does underline how little the accepted wisdom concerning educational delivery has so far been challenged. Education is still broadly conceived as the transmission of a given body of knowledge from either a teacher or a book or some combination of the two, knowledge which is ‘studied’ by the student and hopefully ‘learned’ sufficiently well to be reproduced in some kind of examination process. If all goes well, the student passes the test set and everyone is happy. If it does not go well, failure is generally explained as either a lack of application on the student’s part (‘must try harder’) or as a reflection of some innate weakness on the part of the latter (‘less-able student’). This model of learning, accords ill with what we know from the growing body of ‘learning science’ (Claxton, 1999) even in the Western world in which it mainly developed. It accords even less well with the traditions and learning approaches of other cultures (see, e.g., Watkins & Biggs, 1996; Hufton *et al.*, 2003).

Given the hitherto largely unchallenged nature of this paradigm, either by educationists or by policy-makers, it is unsurprising that virtually all educational research, including comparative education, focuses in one way or another on aspects of this ‘delivery’. Whether it is the formation of education policy, educational administration and management, the training of teachers, questions of school organization, curriculum development, assessment procedures or any of the other topics that form the focus for educational research, such studies are almost always conceived within the status quo in that they concern how to improve on solutions to current problems of organization and delivery – how we can provide education more efficiently, more equitably, or more effectively. Rare indeed are the occasions when either the theoretical or the empirical magnifying glass is set up to examine rather different assumptions and questions concerning education and learning.

Thus, although pressure has been building up within the field of comparative education to recognize the significance of the cultural flesh on the skeleton of laws and policies, systems and resources which formally define educational provision, this trend

has yet to challenge the established parameters of the field. It has yet to challenge the discourse that defines educational issues in terms of a delivery model of education in which countless thousands of children and young people throughout the world are more or less successfully processed through centrally determined curriculum packages and taught to compete with each other in the business of regurgitating their knowledge in specific ways. Most contemporary developments within the field of comparative education must thus be regarded as still essentially debates *within* the existing paradigm. There is a need, I would argue, for the application of more postmodern conceptual tools, to create a 'neo-comparative' education (Broadfoot, 1977, 2001) that recognizes the very considerable research evidence that now exists concerning the shortcomings of conventional models of education. The critical lens provided by comparative educational research can arguably play a key role in the search for concepts and approaches that will be more fruitful for the twenty-first century. For whereas the 'delivery' model of education may have served well enough for less rapidly changing times, it is becoming increasingly clear that it is ill-equipped to respond to a world of pervasive information technology, rapidly changing employment markets and the absence of a common canon of values and behavioural norms.

So far, one of the most defining characteristics of the twenty-first century is the erosion of the boundaries between formal education and other activities in life. The worlds of work and home, leisure and study are becoming increasingly integrated. This means that the modernist conception of education as a defined and organized form of activity conducted in a specialist institution and conceived as a preparation for adult life thus becomes increasingly anachronistic. Indeed, it could be said that in an increasingly postmodern world, the continued use of modernist paradigms of educational organization and of teaching and testing, are a powerful reactionary force helping to sustain the status quo. If the 'normal science' (Kuhn, 1962) of education is to be challenged, then research must provide the seed bed of the necessary 'scientific revolution', or 'paradigm shift'.

Such a paradigm shift, I suggest, needs to move *learning* itself centre stage as the focus of study. Questions such as how individuals can best be helped to engage successfully with the myriad different forms of learning opportunity that technological development has made available pose novel challenges for educational research. For comparative education in particular, the broader and more amorphous territory of learning, challenges its more traditional focus on education systems and the problems of provision. If learning per se, rather than provision for its acquisition or the evaluation of its outcomes, becomes accepted as the new centre of gravity for the discipline, so it might be reasonable to reflect this development in a change of nomenclature. 'Comparative education' as a descriptor might be replaced by 'comparative *learnology*' as a new name for research that seeks better to understand the business of learning by using the systematic comparison of contexts and cultures. The use of the descriptor '*comparative learnology*', whilst not perhaps defensible in the face of a sustained exegesis, would nevertheless provide a strong signal that the centre of attention for such studies is the process of learning itself and the forces that shape individuals' engagement with it.

This is particularly important because, as suggested above, despite the enormous volume of research on teaching and learning that has been undertaken over the years,

there is still a considerable gap in our understanding of how to improve learning outcomes in the many different contexts in which learning takes place. Where there is a preoccupation with ‘what works’ – as is increasingly the case among governments anxious to ‘raise standards’, there is a corresponding tendency to ignore the inevitable complexity of the learning process and a consequent failure to take into account some of the complex social forces that impact upon it. Among these are the following as identified by James and Brown:

- The influence that the environment (characteristics of learners or the learning context) has on the success of a particular approach in promoting learning
- The difficulty of clearly conceptualizing some aspects of learning that are seen as highly desirable (e.g., attitudes, dispositions, values, identities) but do not have a common interpretation in the way that straightforward practical or cognitive skills do
- The difficulty of assessment in cases where a clear conceptualization of the learning is yet to be established
- Problems at a theoretical level that arise from a lack of engagement of many of the theories of learning with those of teaching or instruction (i.e., a lack of pedagogy)
- The need to provide evidence of learning in a form that will convince the community beyond academic researchers’ (James & Brown, 2005, p. 9)

As James and Brown argue, how individuals learn in different settings and cultures and how this process can best be facilitated, are questions to which the answer is neither simple nor unambiguous. Indeed, so complex are the factors involved that, in the best traditions of social science, as Kazamias has argued (Bouzakis, 2000), illumination is as likely to come from the humanistic tradition using, for example, a historical approach, case studies and other forms of qualitative data, than from the more systematic, controlled studies of the positivist tradition. Alexander’s comparative study of learning in five countries provides a good illustration of this approach building on the foundations laid by earlier studies such as those of Osborn and colleagues (2003).

Added to the challenge of seeking to understand the interaction between learning processes, and the impact of particular contexts, is the fact that learning itself takes many different forms. Various efforts have been made to define the main elements such as those of Gardner (1993). Recently, the advent of new neurological research techniques has served further to stimulate such efforts with an unprecedented interest in the brain itself as part of the attempt to understand the process of learning (see, e.g., Perkins, 1995). This application of neuroscience underpins the developing field of ‘learning science’ as a major field of research endeavour to complement more traditional educational perspectives.

Even a relatively high-level categorization of different kinds of learning such as that provided by James and Brown (2005, p. 9) powerfully illustrates the importance of such perspectives where learning is the central focus of enquiry:

- Attainments including subject knowledge or work competencies
- Understanding – of ideas, concepts and processes
- Cognitive and creative learning involving performance or ‘new’ knowledge
- Using – involving the application of practical or technological skills

- Higher-order learning including metacognition
- Dispositions – attitudes, perceptions, motivation
- Membership, inclusion self-worth – the shaping of learner identity

The particular contribution that comparative studies can make to our understanding of these complexities is the effort to understand the complex interaction between different kinds of learning and different cultural and institutional settings such as attempts to explain and evaluate the significance of the various kinds of learning that individual cultures prioritize. Moreover, a particular strength of a comparative approach to learning science as embodied in a '*comparative learnology*' would be a respect for the cultural integrity of key concepts. Such a research approach would make no initial assumptions about how the purpose and processes of learning were being defined in the setting being studied.

Whilst the differences between cultures in this respect are unlikely to be as significant in today's, post-colonial, globalized world as they once might have been, there remains plenty of evidence in the pages of both anthropological journals and those dedicated to comparative education that processes of learning and their goals continue to vary widely around the world. Moreover, as priorities for learning change in response to social and economic change, there is likely to be increasing fracturing of traditional educational models and tools.

Educational testing provides a powerful example of the potential difference between modernist and postmodernist educational perspectives. The quotation below describes a more humanistic, individualized perspective on this most positivist of educational technologies:

[I]f being a learner is about becoming a member of a community and engaging in norms of social practice and tool use, or if one accepts 'knowledge creation' as an important learning outcome in a knowledge society then the perceived need for valid and reliable assessment instruments ... might disappear. ... If the learning outcomes in which we are interested are dynamic, shifting and sometimes original and unique, we need a new methodology of assessment, perhaps drawing more on ethnographies and peer-review approaches in social science, appreciation and connoisseurship in the arts and advocacy, testimony and judgment in law. (James & Brown, 2005, p. 19)

Such an approach to evaluation is in stark contrast with the kind of modernist approach embodied in most contemporary forms of assessment and testing which are predicated on an objectivist stance. The series of international surveys of educational attainment of recent years provide one of the most powerful examples of this tradition using as they do, sophisticated quantitative methodologies for comparative purposes. Reviewing the key role of OECD in such studies, McGaw (2004) provides the following description of the search by a consortium of 30 member countries for education 'indicators' that will permit:

The systematic examination and assessment of the performance of a state by other states, with the ultimate goal of helping the reviewed State improve its

policy-making, adopt best practices, and comply with established standards and principles. (Pagani, 2002, p. 1)

This project is based on a model of education that assumes that ‘one size fits all’. It is arguably flawed both in not taking into account significant contextual differences between the nations involved and in not questioning the accepted structures and delivery of formal education as it has evolved in the last century or so.

Yet, although many comparativists have deplored the technical inadequacies of such international surveys of achievement over the years (see, e.g., Goldstein, 2004; Brown, 1999) there has been little attempt so far to challenge them in the terms set out above, namely, that such surveys of achievement represent the increasingly global imposition of a unidimensional model of education that reinforces and celebrates only a small part of the rich tapestry of actual and potential learning. The more countries strive to compare themselves on such common yardsticks, the more it becomes unlikely that comparisons of other kinds of learning outcome will be pursued, which are less amenable to formal assessment, even though they may be more important.

I rehearse these arguments in order to highlight the urgent need for comparative educationists to recognize that as the field is becoming increasingly influential in policy terms, so the responsibility of comparative education to be self-critical in terms of its focus and methodology also grows correspondingly. It would be a sad irony indeed if the contemporary dynamism of the field proved, in the end, to be a reactionary force rather than fulfilling its unique potential to provoke a fundamental questioning of accepted perspectives within education.

If the digital revolution and the dawning of the information age means that formal education provision is becoming a relatively small part of the range of learning opportunities available to individuals, comparative studies of that learning need to embrace both the widest possible range of theoretical perspectives and the full canon of available methodologies from complex statistical analyses based on huge quantitative data-bases at one extreme through to intensive ethnographic studies on the other. A comparative focus on the process of learning itself offers a far more ambitious intellectual project with the potential for research that embraces a scale and range of contributory disciplines hitherto almost unimaginable to address, for example, the much neglected ‘affective domain’ – the part played by the perceptions and feelings of the individual learner. Thus, comparative studies could draw on insights derived from anthropology to neuroscience, political science to systems engineering and the arts, to gain a much more profound understanding of the constants and contexts of learning.

The initial contribution of adopting a ‘comparative learnology’ perspective would be to problematize the discourse of comparative education since the existing apparatus of educational assumptions and terminology arguably encourages collective conceptual blinkers. Even the most familiar terms – ‘comparative’, ‘international’, ‘system’ and ‘policy’ – embody a range of taken-for-granted assumptions about the appropriate focus and subject matter for such studies. As such, these terms, as a form of discourse, are themselves a source of power and control (Foucault, 1977).

The skeptical reader may justly feel that this bandying of new jargon is neither necessary nor helpful. It is certainly the case that for a century or more, comparative

education has provided a wide range of valuable insights into aspects of educational provision and practice – the deliberate management of learning – and that it is these insights that form the foundation for the current ascendancy of the field. But despite these successes, I suggest that if comparative education *remains* in this paradigm in the future, it will find itself in a self-referencing and self-reinforcing vicious circle in which research fails to challenge in any fundamental way the conventional ways of conceiving learning and hence, educational problems and issues. Having failed to rise to the challenge of change, comparative ‘education’ will in turn find the validity and reliability of the research process subject to progressive erosion and with it, the capacity of the field to make an impact.

A comparative study of learning, by contrast, what I refer to here as ‘comparative ‘learnology’’, offers an exciting range of new research avenues. Such a ‘neo-comparative education’ would still retain an important place for the existing project of comparing the educational process in different cultures. However, it is likely to involve a more interdisciplinary even ‘meta-disciplinary’, approach in which a range of social disciplines such as sociology, politics, economics, geography, cultural studies, anthropology and history combine on occasions with the physical sciences and medicine, to illuminate the complex and interrelated realities that impinge on learning. Examples in this respect might include the interaction between diet and learning outcomes in different cultures, or the impact of pollution on brain functioning in different national settings. In both these cases, whilst there may be significant differences in the educational interventions in the settings being compared, these interventions may ultimately be of less significance than differences between the populations being studied that derive from quite different factors. A focus on learning, rather than education per se, will, I suggest, make it more likely that these other factors and perspectives will be taken into account. This in turn should encourage a challenge to the established boundaries of the field that will provoke new questions and concerns as well as eventually, produce new insights that will challenge the dominance of prevailing discourses about what is desirable in education and how this may best be achieved.

Some Problems of Methodology

Shifting the focus of comparative study from education to learning also requires the development and use of new research tools that take full advantage of contemporary advances in technology in their ability to capture and compare social reality. Such developments make it possible to anticipate the possibility that the twenty-first century will witness significant development in terms of the rigour, scale and innovation of comparative methods.

Thirty years ago, writing in a special issue of the journal *Comparative Education* devoted to the then ‘state of the art’, I suggested that ‘comparative education is not a discipline but a context’ (Broadfoot, 1977), that it needs to be conceived as part of a more generally conceived – the word repetition is deliberate here – interpretive social science perspective. The challenges for comparative education are thus the challenges for social science as a whole. As comparativists, we endeavour constantly to ‘make the

familiar strange', to recognize that in a 'science' where words are the principal tools, there must be a continual search for new epistemologies, new methodological tools and new vision. Yet comparative studies also provide a particular challenge since of all the methodologies of social science, they are potentially among the most powerful providing as they do something of a 'virtual' laboratory' for the study of different approaches to aspects of social organization. It is the recognition of this potential that is fuelling the significant growth of large-scale international comparative studies at the present time such as the European Social Survey (www.europeansocialsurvey.org) which involves a series of collaborative surveys between more than 20 countries to compare key facets of contemporary life in those countries.

But if comparative studies offer perhaps the best approximation in the field of social science to the systematic research methods of natural science, they are also associated with some of the most difficult methodological challenges. This is particularly the case in relation to the comparative study of learning since the latter involves such a complex interaction of different factors. Thus, as I outline below, a 'comparative learnology' is likely to require sophisticated methodological approaches that take full advantage of the new social research technologies now being developed.

Cultures and Contexts

Not surprisingly, the challenges facing the development of comparative education are broadly shared with other applied social fields such as Social Policy. At the present time all social science disciplines have to respond to the challenge of globalization which is reflected in the increasing importance of an international focus both for research problems and in the organization of research teams. The recent European Union initiative to establish 'Networks of Excellence' (www.frontierseu.org/networks), for example, is typical of the growing trend towards larger, international collaborations in research projects and the development of communities of researchers drawn from several nations. But whilst such cooperation is in principle supportive of both the rationale and the practice of comparative studies, it also highlights the endemic problems of working across contexts and cultures.

Whilst these problems accompany both quantitative and qualitative studies, it is with regard to the latter that some of the core issues of comparative studies become particularly intractable. The difficulty of achieving equivalence of concepts and comparability of meaning between cultures and contexts, for example, or the representativeness of the cases chosen for study is particularly salient when generalizability depends on a relatively small number of cases. The logic informing the choice of case or country selection will critically affect the validity of the study. Whilst the standard assumption is to compare 'most similar cases' this may not always be the most fruitful design and it will not be easy to know this at the outset of a qualitative study. Where studies depend heavily on words, rather than numerically coded data, there may be problems working with raw data that is rarely fully translated or where the data have been translated, since such data are inevitably subject to the overlay of human interpretation by others such as interviewers and translators, as well as by the researchers themselves. Moreover, the

data that form the basis for analysis are often summaries of cases – cases that are often not comparable if produced by an international team especially if they are derived from Government sources.

Yet difficult as such issues are methodologically, they must be addressed if a sufficiently rigorous basis for comparative qualitative studies is to be provided. For, as Stenhouse (1979) argued, there is a need for a much greater emphasis on evidence in the conduct of comparative studies because it is through the provision of evidence that:

[e]xperience is made public to invite judgment in dialogue, and such judgement rests upon the possibility of an appeal to evidence. This evidence, the fundamental data source for comparative education, must be description; and I am going to argue that since it became a self-conscious academic study, comparative education has paid too little attention to observation and description, preferring to emphasise such abstractions as statistics and measurements on the one hand and school ‘systems’ on the other. ... [A] comparative base for critical interpretation is of very great importance.

I am ... asking that we develop in our field a better grounded representation of day-to-day educational reality resting on the careful study of particular cases. (Stenhouse, 1979, pp. 8, 10)

Sharing Access to Data

If the starting point for a ‘comparative learnology’ is the individual learner’s lived reality, their feelings and experiences, then the sort of observation and description called for by Stenhouse must be the starting point. This approach requires the application of specific qualitative methods including the capture of biographical and visual data, in order to understand the diversity of individual experience and the impact of change, that is, methods that can capture the intersection of time and space. Such case-based, rather than variable-based comparisons, provide for an understanding of the different layers of context. They can form the basis of controlled comparisons or be simply in the form of a patchwork of qualitative case-studies.

But whatever their design, the data produced by studies that emphasise observation and evidence present a particular challenge in terms of their accumulation, storage and future access. Where large sums of money have been spent on a cross-national comparative project, it is clearly desirable that the products are stored in a form such that they can be readily accessed by other researchers in the future. Once again, it was Stenhouse who exhorted researchers to be ‘meticulous about their records and, as soon as they have completed their study, such records of first hand observation and interviewing need to be lodged in national archives which could be replicated internationally on microfiche’.

If the first part of Stenhouse’s exhortation has proved difficult enough to achieve – the UK requirement to lodge all qualitative data derived from ESRC sponsored research

in the ‘Qualidata’ national archive, for example, has proved costly and demanding for researchers in terms of organization, funding, legal obligations and protection – how much more challenging will be achieving similar repositories on an international scale, with all the legal and language issues involved. The rapid development of ‘grey literature’ available on the internet coupled with the development of open access repositories represents a significant step forward in our collective technical ability to share both data and analyses. However, significant challenges remain concerning the management of and access to such sources. As with any large research team, there are more or less complex issues of ownership, authorship and the archiving of data, the increasing prominence of research governance and ethics issues and the requirement for transparency in relation to respondents, suggests a growing need for agreed international protocols and standards, research guidelines and an ethical code. But at present there is no obvious international body to translate such pressures into action.

Funding Constraints

The problems associated with large-scale data management and access are compounded by prevailing research funding regimes. Historically, comparative education studies have found it difficult to attract funding. More recently, the growing recognition on the part of governments in particular of the value of comparative studies has meant that such funding is now more readily available. Yet the latter remains both largely national in focus and short-term. Not only does this make it difficult to set up more internationally focused projects, it also renders studies and the data they produce, vulnerable to national political agendas and protectionism with regard to access. Although there are some green shoots appearing with regard to international cooperation on data storage and access, such developments remain a long way short of the sustained international effort that would be needed to establish data repositories on the kind of significant international scale that currently prevails in other fields such as Medicine.

The Skills Gap

There is also the problem of ‘the skills gap’ – an international cadre of researchers who are trained to a sufficiently high level not only in the basic quantitative and qualitative methodologies of comparative education, but in the specific linguistic, theoretical and methodological skills needed to undertake a rigorous comparative study. The exceptionally challenging task of studying two or more locations each with its several levels of context and culture that impact in a complex way on learning, calls for individuals with very specific experience and training. The anthropologist undertaking an ethnographic study of a particular classroom setting or cultural learning tradition is faced with an exponentially more complex task if the study becomes a team-based and multi-site comparison as several recent comparative education studies have illustrated (Osborn *et al.*, 2003; Alexander, 2000). The need for researchers to work in increasingly interdisciplinary teams, and to be able to access and use ‘metadata’ of all kinds, is likely to require a significant increase in the level of methodological training

available to both new and experienced researchers if they are to be equipped with the skills to take advantage of these new facilities.

The result of all these problems associated with pursuing comparative research, as Holmwood (2005) has argued, is that a great many comparative studies, including a good number of those in the field of comparative education, have exhibited depth without breadth in the form of an in-depth, narrowly oriented study of a single setting or case or, at the other extreme, breadth without depth, manifest in large-scale, often quantitative, cross-national comparative projects seeking to garner basic data from multiple cases.

The pursuit of comparative studies of learning or what I have termed ‘comparative learnology’, arguably requires the rich descriptive power of a qualitative approach since only this kind of approach can preserve cultural integrity and hence validly represent the situational wholeness of learning. Whilst it would be wrong to decry the value of more quantitative and large-scale comparative surveys, for both hypothesis formation and hypothesis testing, I submit that such studies are more likely to reinforce outmoded ways of thinking about educational delivery and particularly about learning. The spurious seductiveness of what the nineteenth-century British Prime Minister, Benjamin Disraeli, referred to as ‘lies, damned lies and statistics’ has a great capacity for reification. As is widely acknowledged, statistical data alone are unlikely to be able to explain and situate the patterns they document.

Figure 1 provides a typical example in this respect. Using data drawn from the OECD PISA study, it presents a very interesting set of data concerning the relationship between achievement in Mathematics as a function of within and between school differences and social background. Powerful as such comparisons are they are likely to be substantially more valuable if embedded in a much more comprehensive database of different kinds of data involving sustained and sophisticated interdisciplinary data collected over a long period of time.

By the same token qualitative studies are bedeviled by the difficulty of producing findings that are sufficiently large scale and convincing in their rigour to be able to challenge accepted orthodoxies. The successful realization of a ‘comparative learnology’ providing comprehensive and generalized insights into learning will require both these challenges to be overcome. This will require both a step change in the scale of data collection and management currently being undertaken, more sustained funding and a significant increase in international cooperation.

So far I have argued that the potential contribution of comparative education, like other comparative fields of study, has been limited both by the burden of an accumulation of different and abstract epistemological positions which can be found in the history of the field and by the limitations inherent in established approaches to data-gathering and analysis. In the third section of this chapter, I explore the prospects for overcoming these constraints in terms of the potential to expand exponentially the scale and quality of the enterprise whilst retaining the ecological validity of the subject. I deal first with the potential contribution of new methodological tools and then finally, with the epistemological perspective which should drive the future use of these powerful new research instruments.

New Questions, New Tools

As suggested above, one of the most promising contemporary developments in comparative studies is the potential contribution of new technologies. At the most basic level, such technologies are transforming the possibilities for international collaboration between researchers. The advent of 'access grid nodes', for example, which has made it possible to have virtual electronic meetings, is transforming the constraints of time and cost that inhibited such collaboration in the past. Such opportunities for live discussion and sharing have in turn made much more practicable the blending of different cultural perspectives so necessary to authentic comparative studies.

Even more significant, potentially, is the capacity for new technologies to transform the scale of data collection and storage. It is becoming increasingly possible to capture live performances of various kinds, not only in more familiar oral and video recordings, but also using digitization. This in turn permits access to data at a distance as well as more sophisticated comparisons of its content. Thus, for example, data from the three existing sweeps of the European Social Survey (ESS), which aims to provide a high quality measure of long-term change in international attitudes, currently involves 27 European countries and has produced a vast volume of comparative information about these countries, which is readily accessible to academics around the world using their own desk-top computers.

Moreover, access to huge international data-sets seems set to grow exponentially as a result of advances in 'E Science'. This is the capacity to transport huge volumes of digital data by means of 'the grid' – a very high powered international computer network. Developed by natural scientists, these technologies are now being harnessed by social scientists to make possible the advent of 'E Social Science'. It is now possible to begin to use such techniques for retrieving archived data, for example, – to capture historical reality in all its richness. Thus for example, in the UK the 'JISC' Digitization programme is making possible the translation of some 600 volumes of census reports relating to the British Isles covering the period from 1801 to 1933 which will be available to any researcher who wishes to access it. News stories dating back to 1896 and television newsreels from 1955 are also being made into a digital historical archive.

At present such projects are not focused directly on education but it is easy to see how the availability of huge volumes of digital data – whether numeric, pictorial or text-based – will transform our collective capacity to interrogate the reality of social life on a comparative basis. In due course, the availability of 'qualitudinal' surveys – longitudinal qualitative data-bases of aspects of social life in different countries – will complement the existing quantitative, longitudinal surveys which have long been the bedrock of epidemiological studies in public health and to an extent, in education.

Such developments make it possible to begin to imagine the advent of comparative studies of a quite different order of magnitude than in the past, with data-bases and associated search tools that begin to rival some of the most prestigious natural science installations such as the high speed particle collider at CERN in Switzerland that is provided by means of scientific collaboration between many nations. If it is now not too difficult to begin to envisage a future in which the collective capacity to do comparative studies will be vastly enhanced by the availability of huge, well-organized and textually

rich data-bases, complete with user-friendly interfaces. Such facilities are also likely to bring with them new methodological challenges in terms of data-management, data ownership and access, the protection of confidentiality and so on. As well as requiring much more sophisticated ethical and administrative protocols, the operation of such 'comparative laboratories' on a collaborative international basis presents quite new political and methodological challenges. This is already apparent in the attempts by the European Union to set up such a European Observatory for the social sciences (EHROS).

To take advantage of such developments it will be necessary for scholars in the field of comparative education, as in other comparative social science fields, to be highly trained professionals in *methodology*, as well as in their chosen subject of study, capable of working across other cultures and disciplines as a global community of researchers. As is increasingly being recognized, the pressing social problems and issues of our age are both global and complex, requiring an unprecedented degree of interdisciplinary and international collaboration. As I have suggested, one of these contemporary global issues, is the need to address the very substantial new challenges facing the world of education through the use of comparative methods that will permit a better understanding of learning in all its contexts and modes.

These methodological and organizational developments have the potential to take us a long way from the traditional territory of comparative education. They suggest the possibility of the collection and coordination of data concerning education and learning to become as sophisticated and coordinated internationally as is currently the case for other fields such as health or climate change whilst retaining the necessary depth and range of qualitative material that is essential to sustain the cultural integrity of the data. This has not typically been the case up to now for, as the following statement from the UK Economic and Social Research Council illustrates, even where substantial international and interdisciplinary coordination of data management has taken place:

[t]he heavy investment by international organizations such as The Council of Europe, Eurostat, the International Labour organization, the United Nations and the World Health Organisation in data mining and post hoc harmonization of national data, this has not been matched by a similar level of attention to methodology, methods training, research design and the research process among funders. As a result, many of the projects supported by international organisations are limited to series of parallel (noncomparable) studies. Frequently, national teams collect data about a specific phenomenon in their own countries without prior discussion of crucial methodological issues, such as the social construction of concepts in different cultural conditions and research communities national or ideological contexts. (Holmwood, 2005, p. 2)

It is increasingly being recognized that all social science is by definition global, and that the use of comparative methods therefore is in turn fundamental to social science. Historically, the vision of many comparative fields has been limited by discipline and scale and by a national focus. The potential of such studies has also been limited by a failure to work collaboratively and to be too content with a 'cottage-industry' approach in terms of funding, methodological sophistication and the provision of large-scale infrastructure.

Although comparative education has been characterized by some commendably ambitious attempts to increase its scale and impact, such as the PISA study referred to above, such international collaborations have been far from typical. Moreover, the political and methodological challenges inherent in such collaborations have inevitably led to limitations and compromises in the depth and comparability of the data collected.

Towards a Neo-Comparative Education

In this chapter, I have argued that with the new methodological possibilities that political and technological advances are now increasingly opening up it is time to engage in the collective challenge of ‘re-engineering’ comparative education. This does not simply mean the pursuit of richer, deeper, larger-scale and more collaborative studies. Nor does it mean the creation of sustained comparative ‘observatories’ or data laboratories housing data on a scale hitherto undreamed of in the world of social science yet accessible from the desk-top computer, important as both such contemporary developments promise to be. New technical and methodological opportunities such as these can only be of limited usefulness unless they are accompanied by a willingness to think through anew the questions that drive such data-gathering and analysis.

For, however sophisticated the technologies for data collection and management become, as far as the social sciences are concerned, there must also be provision for the more reflexive engagement of the researcher with context and culture. There is a fundamental difference between the natural sciences and the human sciences since, as Habgood (1998) has argued, the latter are fundamentally interpretive. The philosophical foundations of the human sciences, he suggests, are defined in terms:

which cannot exclude the role of the human mind in expressing intentions, generating meaning and discerning values. ... The human sciences seek for understanding through a process of interpretation and total lived experience of being human ... without allowing individual disciplines to obscure the complexity and interconnectedness of actual human existence (p. 6). ... But as we reflect on what we ourselves are, and on what our history has made us, all the disciplines are relevant because we stand at the point where they all meet, both as observers and as objects of study. (p. 10)

Comparative education has always been explicitly or implicitly reformative or, as Nicholas Hans famously put it ‘intentionally reformative’. The reason for undertaking comparative education studies has not typically been simply that of scholarly interest, though there is a place for this. Rather, as with most other branches of educational research, the goal historically has been to find ‘what works’ and to use such insights to inform educational policy-making and educational practice. Whilst few would want to quarrel with this broad aspiration as a prospective goal, in practice its pursuit rests on a judgement about what constitutes reform or improvement. In order to map out a journey, it is necessary to have a clear view of the destination. This in turn implies the

need for a root and branch examination of the epistemological foundations of what we now know as ‘comparative education’.

The key argument of this chapter has been that what we currently refer to as ‘comparative education’ needs to broaden its focus to embrace *learning of all kinds* as its central focus. I have suggested that the contemporary field is constrained by the conceptual constraints associated with modernist assumptions about educational delivery. Such concepts, which were the product of a very different time, remain an important and fruitful focus for comparative education study. However, as the world of education itself becomes subject to increasingly radical change, so, I have suggested, the centre of gravity for comparative education needs to shift towards a more central focus on learning rather than education per se. We need to begin to question whether the world of education in the future will need classrooms and schools, books and teachers, syllabuses and tests as we know them today, How will new technologies with their capacity for individualizing learning; for making it fun; for providing immediate feedback; and for being accessible at any time and in any place, impact on different cultures? What will be the balance of learning in and out of formal institutions, at home, school and work, at different ages and for different purposes? What kinds of learning will be most important? Will learning how to learn, for example, replace ‘learning that’ or ‘learning how’ as the key driver? Where will moral and spiritual learning figure compared to other kinds of curriculum content and skills development in the societies of the future?

On the answers to these and similar questions rests the legitimate focus for future comparative studies of education. In particular, I have suggested that the comparative education of the future will need to be capable of both framing and capturing the diversity of *learning* that goes well beyond what is conventionally encompassed in the term ‘education’ at the present time. The advent of this shift in the focus of study for comparative education happily coincides with the growing availability of much more powerful research tools for data collection and analysis. The capacity of these new tools to capture the rich complexity of daily life and to make such data widely available on an international basis offers, I suggest, an unprecedented opportunity for comparative education to upscale from a ‘cottage industry’ endeavour to that of a multinational corporation. It is to be hoped that in the future, large-scale and sustained international collaborations of highly trained teams will increasingly provide for the comprehensive study of learning, the scale of collaboration hitherto only associated with international, quantitative studies of achievement.

To the extent that it is able to develop such a capacity for interdisciplinary and qualitative studies of learning on a significant scale, comparative education is likely to move from being either the blunt tool of policy-makers on the one hand or the arcane scholarly endeavour of academics on the other, to being a powerful force for change in the way we think about education. I believe that such a ‘neo-comparative education’ that is centred on the processes of learning itself, can make a significant contribution to the urgently needed re-examination of the goals of education in the contemporary globalized world. Appropriately, (if ungrammatically), termed ‘comparative learnology’, this new orientation might be the first step in a scientific revolution.

RECLAIMING A LOST LEGACY: THE HISTORICAL HUMANIST VISION IN COMPARATIVE EDUCATION

Andreas M. Kazamias

Prologue

The history of comparative education in the second half of the twentieth century has been marked by periodic “systems crises”, in Alvin Gouldner’s meaning of the term. The historian can identify such “systems crises” in the late 1950s and early 1960s, in the mid-1970s and early 1980s, and in the late 1990s and the opening years of the new millennium. “The central implication of a crisis”, according to Gouldner, “is not that the ‘patient will die’, but rather that the system “will change in significant ways from its present of condition”, and that such change may produce “a basic metamorphosis in the total character” (Gouldner, 1970, p. 341). As a result of these critical episodes, comparative education may not have undergone “a metamorphosis of its total character”, but it changed in significant ways. One significant change has been the metamorphosis of comparative education from an essentially historical-philosophical-humanistic *episteme* to an essentially social scientific *episteme*. The concern of this chapter is twofold. First, it briefly examines critically the two varieties of comparative education as systems of thought or modes of inquiry and ways of knowing. The systems in question have drawn their theoretical insights and methodological approaches from the domains of ‘history’ and ‘social science’, and will be referred to as ‘historical comparative education’ and ‘scientific comparative education’ respectively. The second concern of this chapter is to make a case for another intellectual system, mode of inquiry and mode of knowing, or another variety of comparative education, which, drawing from both history and social science, avoids their respective limitations. This alternative system will be referred to as “comparative historical analysis”.

Historical-Philosophical-Humanistic Comparative Education

As examined in greater detail in the first section of this Handbook, the dominant approach to the study of comparative education until the 1950s, as exemplified by such notable comparative scholars as Michael Sadler, Isaac Kandel, Nicholas Hans and Robert Ulich, was what may be referred to as the “historical-philosophical-humanist” or the “historical-humanist-meliorist” approach. Other comparativists, for example, Brian Holmes has referred to the major representatives of this genre of comparative education as “historian

comparativists” or “historian comparative educationists” (Holmes, 1965, p. 64). In epigrammatic form, the main characteristics of the “historical-philosophical-humanistic” generation of comparative education discourse have included the following:

- Comparative education is a ‘human science’, as connoted and denoted by the Greek term *episteme* and the German *Wissenschaft*; it is not an empirical or positivistic social science. According to Hans, “comparative education as an academic discipline is just on the border line between the humanities and sciences and thus resembles philosophy, which is the formulation of both” (Hans, 1959, p. 299).
- Related to the above, comparative education, to use Karl Popper’s classification of the sciences, is a “historical science” not a “generalising social science”. As a “historical science” its epistemic focus is on the illumination and explanation of the particular, of specific events, not on universal historical laws (Popper, 1957, p. 254).
- Related to the above, comparative education is a *hermeneutic*, explanatory *episteme* that aims at historical interpretation. In one of the many statements on the nature of comparative education, Kandel has written:

The thesis that the study of education without a study of all the backgrounds which give meaning is to reduce it to absorption with techniques which, however useful, furnish only a narrow approach to the fundamental concepts and purposes of education. It is significant that the earliest and still the most living contributions to the philosophy of education deal with education not in isolation but in their political, social and ethical setting. ... The real contribution of the history of education lies in introducing the student to an appreciation of the relativity of education to the multiplicity of the forces in its contemporary setting. ... Comparative education, the study of current educational theories and practices as influenced by different backgrounds, is but the prolongation of the history of education into the present (Kandel, n.d., pp. 164–165).

And again:

[T]he study of comparative education as a method of clarifying and interpreting educational issues has its proper and rightful place by the side of the study of the history of education; to ignore these two methods of approach is to fail to recognize their value for building a philosophy of education and as a consequence to run into the danger of spinning educational Penelope’s webs (Kandel, n.d., p. 185).

- In so far as it deals with ‘education’, not just in the narrow sense of ‘schooling’ but in the broad sense of *paideia/culture*, comparative education’s main concern as a ‘human science’ should be with the ‘human being’, the *anthropos* (‘man’). It should, therefore, be *anthropocentric* (‘man-centred’). As such, it should be pervaded by a ‘humanistic’ philosophy, and it should be concerned with the great problems – political, social but also ethical – which ‘humankind’ faces.

In the 1960s, a period during which social science emerges as a hegemonic intellectual system, the historical-philosophical-humanistic discourse in comparative education, as indicated in Section One of this Handbook, was criticised by a new generation of scientifically minded comparativists, but also by revisionist historians. As a consequence,

the methodological, epistemological and *pari passu* the ideological trajectory of comparative education was veering towards the social scientific path.

Social Scientific Comparative Education

As with the historical-philosophical-humanist motif in comparative education, the social scientific motif that became dominant in the years following the first system crisis of this *episteme* in the 1960s is examined in great detail in the first section of this Handbook. And as with that motif, here I shall refer rather briefly to the distinguishing features of this genre of comparative education discourse and comment critically on it. It might be helpful at the outset to delineate some of the most important features of social science and the scientific method.

The ultimate purpose of the non-human sciences is prediction and control. In pursuing this purpose, scientists in the main formulate explicit hypotheses, test them in laboratories or other sites/contexts, and seek to establish generalisations or universal laws. While natural/physical scientists seek to establish universal laws concerning physical phenomena, social scientists attempt to do so with respect to social phenomena. Another feature of science is that the findings are subject to replication for purposes of confirmation or refutation. Furthermore, one of the essential concerns of the social scientist is explanation, that is, in addition to describing social phenomena, the social scientist is also interested in explaining why such phenomena are the way they are. But it should be noted here that ‘explanation’ in the empirical social sciences is different from historical explanations.

As a participant in the debates on the nature and scope of comparative education in the comparative education crisis of the 1960s (Kazamias, 1963), I cited Nadel’s method of “co-variations” as a good example of the comparative method as used in the social sciences. According to Nadel, variations of social phenomena are first observed, and then general uniformities or regularities are arrived at. Such correlations or co-variations are not causal connections; they are of the type: “X varies as Y does” or “when A occurs, B also occurs” (Nadel, 1951, pp. 222–226). Although I judged Nadel’s method of “co-variations” to be “an extremely valuable scheme” for research in comparative education, I also pointed out that it had certain “limitations” and “dangers” if not used carefully. “As is the case with most social ‘general laws’”, I wrote, “the ‘if A then B’ type of law cannot but be a limited one, for obviously the S(n) situations are limited”. Then I commented on the nature of “scientific laws” in the social sciences, particularly in sociology, which at the time informed comparative studies in education, particularly “functional sociology”. I then wrote:

In so far as sociology is a science, sociological laws must necessarily correspond to scientific laws with universal applicability and with explanatory and predictive powers. Some sociologists have indeed attempted ... to establish universal propositions or general laws of human behavior. However, as Barrington Moore has noted, it is safe to assert that ‘generalizations of social science nowhere approach the range and cogency of those in physics and chemistry (Kazamias, 1963, p. 391).

In subsequent assessments of the “functional sociological approach” to comparative education, I wrote:

The structural-functional perspective of the '60s has however: a) resulted in reductionist tendencies; b) restricted the types of questions raised; c) forced comparative educators into a conservative ideology regarding schools; and d) led them to overlook important aspects of educational change (Kazamias, 1972, p. 408).

Furthermore: "Structural-functionalism, as a framework to analyze and interpret society and social changes has been assessed as consensus-oriented, politically conservative, and a historical" (Kazamias & Schwartz, 1977, p. 162). In the same vein, Benjamin Barber averred:

Despite its vaunted neutrality, functionalism is pervaded by instrumental values such as stability (homeostasis) and efficiency ('good functioning' per se) that give it a static and politically conservative temper ... at the same time, by refusing to deal frontally with categorical purposes and human projects, functionalism depoliticizes its subject-matter and trivializes its contents (Barber, 1972, pp. 430, 435).

Another variant of scientific comparative education was advocated by positivistic social scientists, the most prominent of whom were Harold Noah and Max Eckstein of Columbia University and George Psacharopoulos, formerly of the London School of Economics and later of the World Bank. As I wrote elsewhere:

Noah and Eckstein, two influential comparativists, advocated a scientific comparative education that would conform to all the epistemological and methodological accoutrements of what Benjamin Barber had called 'methodologism' and we had then called 'methodological empiricism, namely, hypothesis formation and hypothesis testing, verification, control, scientific explanation, prediction, quantification, positivism and theory construction (Kazamias, 2001, p. 441).

Some of the contemporary comparativists, including this writer, were critical of the emerging social scientific discourse in comparative education, especially the positivist motif. Among other things, we were critical of the emergent scientific paradigms for being "ahistorical". Also, as noted above, I was critical of the traditional historical-philosophical-humanistic approach. Instead, I called for a "revisionist historical approach, one that would combine history with social science" (Kazamias, 1961, 1963). I referred to this approach as "comparative historical analysis", one that would construct a comparative historical educational *episteme* akin to comparative history and comparative historical sociology.

Comparative History, Comparative Historical Sociology, and Comparative Historical Education

Comparative history, according to Marc Bloch, the historian of the French Annales School of historiography, is a purely scientific discipline, oriented towards knowledge and not towards practical results. History, Bloch further notes, "is animated not by the

love of the past, but by a passion for the present; it is this faculty of understanding the living [that] is, in very truth, the master quality of the historian” (Bloch, 1964, p. 43; Larsen, 2001). And in the same epistemological vein, the eminent Max Weber has noted that comparative history uses the comparative method as a tool of dealing with explanation of a given historical problem.

Looking at comparative history more from a sociological, that is, a social scientific rather than a historical perspective, Theda Skocpol, a comparative historical sociologist, noted that there are at least three variants of comparative history:

Some comparative histories, such as the *Rebellious Century. 1830–1930*, by Louise and Richard Tilly, are meant to show that a particular general sociological model holds across different national contexts. Other studies, such as Reinhard Bendix’s *Nation-Building and Citizenship* and Perry Anderson’s *Lineages of the Absolutist State*, use comparisons primarily to bring out contrasts among nations or civilizations taken as synthetic wholes. But there is still a third version of comparative history – which I am here labeling the method of comparative historical analysis – in which the overriding intent is to develop, test, and refine causal, explanatory hypotheses about events or structures integral to macro-units such as nation-states (Skocpol, 1974, p. 36).

And again, from the same perspective, by Skocpol and Somers:

[C]omparative history serves as an ancillary mode of theoretical demonstration. Historical instances are juxtaposed to demonstrate that the theoretical arguments apply convincingly to multiple cases that ought to fit if the theory in question is indeed valid ... The point of the comparison is to assert a similarity among the cases – similarity, in terms of the common applicability of the overall theoretical arguments that ... (is) presenting.

And again,

[I]t is characteristic of all works of parallel comparative history to elaborate theoretical models and hypotheses before turning to historical case illustrations (Skocpol & Somers, 1980).

These references highlight quintessential elements of comparative history that would inhere in a reinvented historically oriented *episteme* of comparative education. One is the element of explanation and interpretation for the purpose of understanding any aspect of the educational enterprise. This *epistemic* element alone differentiates the comparative historical approach to the field from other prevalent approaches, particularly from the positivistic scientific paradigms. It also places this type of comparative analysis in the category of the interpretive-explanatory rather than the predictive sciences. There is a great difference between these two modes of comparative study, an elaboration of which is beyond the scope of this chapter. In other words, comparative historical analysis deals with explanation and interpretation rather than prediction. It is a retrospective rather than a prospective analysis, in the sense that it begins with

particular historical conditions, causes if you like, that are related to the system/event under consideration.

The other quintessential element of comparative history that is implied above, that would be germane to a reinvented historical approach to comparative education is the use of concepts, models and theory in the comparative analysis of educational phenomena. Most historians are not theoretical, but most comparative historians use to a degree more or less theoretical insights from other disciplines. Most social scientists and sociologists, however, are theoretical. Sociologically oriented historical comparativists, with varying degrees of emphasis on the generality of theory, seek to combine social theory with historical analysis and interpretation.

In some such studies, for example, Neil Smelser's *Social Change in the Industrial Revolution*, specific historical patterns, structures, institutions or processes are approached, analysed or illuminated in terms of, or as illustrations of explicit, formal conceptual models drawn deductively from sociological theoretical traditions. Preoccupation with an explicit conceptual model, likewise deduced from sociological theory (in this case a combination of functionalism and Marxism), characterises also Immanuel Wallerstein's "world system" approach as applied in his book *Modern World System*. The difference between these two approaches is the generality of the theory. Smelser formulates a middle-range theory of social change, while Wallerstein offers a model with universal applicability, purporting to explain global developments from the Neolithic Revolution to recent times.

In still other forms of comparative history, theories (e.g., functionalism, Marxism, modernisation, postcolonialism, or other types), or formal conceptual models may not be explicitly invoked or used. Instead, however, there is recourse to concepts of limited or more general applicability (e.g., 'class', 'capitalism', 'power', 'conflict', 'violence', 'reproduction', 'dependence', 'democratisation', 'globalisation', 'systematisation' and 'segmentation'), which provide the 'lenses', or the medium to select, organise and interpret the historical material.

Most historically oriented and theoretically or, conceptually minded comparative historians generally avoid the use of comprehensive theories of the type noted above. One species of the theoretically minded comparative historians is what has been called the "eclectic user" described as follows:

This scholar is interested in theory but can't find a comprehensive theory that is fully satisfying. So, the 'eclectic user' puts together different theoretical insights wherever they seem to apply, or wherever they help illuminate a particular historical situation. Sometimes an eclectic historian will be very explicit about eclecticism and even try out different theories on the same set of historical data. (Kaestle, 1984)

There have been conspicuously few historically oriented comparative educational studies that have used theory either in the systematic comprehensive sense, or in the 'eclectic' sense. Among these few, the following are noteworthy:

Margaret Archer, *Social Origins of Educational Systems* (1979).
Andy Green, *Education and State Formation* (1990).

- Philip Foster, *Education and Social Change in Ghana* (1965).
- Andreas Kazamias, *Education and the Quest for Modernity in Turkey* (1966).
- Andreas Kazamias, "Transfer and Modernity in Greek and Turkish Education", in A. M. Kazamias & E. H. Epstein (Eds.), *Schools in Transition* (1968).

- Shipman M. D., *Education and Modernisation* (1971).
- Michalina Vaughan & Margaret S. Archer, *Social Conflict and Educational Change in England and France, 1789–1848* (1971).

Another characteristic of comparative historical studies is that such enquiries belong more to the qualitative than to the quantitative research tradition, which, among other things, involves comparisons of configurations. These aspects of the comparative historical epistemological and methodological perspective were well stated by Charles C. Ragin in his book *The Comparative Method* (1987) as follows:

Not only is the qualitative tradition oriented toward cases wholes as configurations, but it also tends to be historically interpretive; historically oriented interpretive work attempts to account for specific historical outcomes or sets of comparable outcomes or processes chosen for study because of their significance for current institutional arrangements or for social life in general. Typically, such work seeks to make sense out of different cases by piecing evidence together in a manner sensitive to chronology and by offering limited historical generalisations that are both objectively possible and cognizant of enabling conditions and limiting means – of context.

Ragin further explains:

Most comparativists, especially those who are qualitatively oriented, also seek to interpret specific experiences and trajectories of specific countries (or categories of countries). That is, they are interested in the cases themselves, their different historical experiences in particular, not simply in relations between variables characterizing broad categories of cases (Ragin, 1987, pp. 3–6).

The last point made by Ragin above points to yet another and final for our purposes here, quintessential element of historical comparative educational studies. From our perspective, the comparative historian is interested in interpreting and illuminating specific experiences and trajectories, i.e., in the particular cases themselves. In this respect also, the comparative historical approach to education differs from the social scientific variants as presented above, especially the methodological-empirical and the world systems ones.

The historical comparative studies cited above are examples of comparative historical research that is carried out mostly at the macro level of sociocultural analysis. I should like to add here that there are other noteworthy historical comparative studies that examine synchronically educational problems and issues at the micro level, and diachronically aspects and problems of education in the same society. Also there are studies focusing on one society, a form of historical comparative education demonstrated in A. Sweeting's study of Hong Kong (Sweeting, 1999).

Re-Inventing the Historical Humanist Vision in Comparative Education

In arguing for the reclamation of the disappearing historical legacy in comparative education, I have elsewhere emphasised that history is also a humanistic *episteme*: “it deals with the human condition, with human beings as subjects and not as commodities or numbers, with human cultures as wholes and not narrowly as economic cultures, and with human values, in short with humanistic and humanizing knowledge, in the broad meaning of the term” (Kazamias, 2001, p. 447). And in my critical comments above, I pointed out that the historical-philosophical-humanistic discourse of comparative education, was pervaded by a humanist philosophy and was concerned with the great problems – political, social and ethical – that mankind faces.

Reclaiming the humanistic element in comparative education, is, in my opinion, also implied in Patricia Broadfoot's vision of a “neo-comparative education”. In her words:

We need to recongnise that there is an implicit value position in any conceptualisation of a problem and in the choice of method to study it. Comparative educationists therefore need to be willing to engage in fundamental debates about the nature of ‘the good life’ and about the role of education in relation to this in a world where, increasingly, nothing can be taken for granted. In our unique role that enables us to straddle cultures and countries, perspectives and topics, we have a responsibility to carry the debate beyond the discussion of means alone, and towards ends (Broadfoot, 1999, pp. 228–229).

Epilogue

Recently, some comparativists, older players like Rolland Paulston, Max Eckstein, Robert Cowen, Joe Farrell, Wolfgang Mitter, Jurgen Schriewer, Val Rust, Robert Arnove and Andreas Kazamias, and newer ones like Patricia Broadfoot, Vandra Masemann, Nelly Stromquist, Anthony Welch, Francisco Ramirez, and Carlos Torres to name a few, have taken the challenges of the onset of the new millennium and of the postmodern turn in sociocultural and politico-educational theorising/thinking as an opportunity to both reflect upon the intellectual tradition of comparative education and to engage actively in charting new epistemological and methodological trajectories

or paradigms. In the new era of late modernity and even postmodernity, the stage is being set for the performance of a new dramaturgical act in the multifaceted *protean episteme* of comparative education. At the 2001 Washington, D.C. conference of the Comparative and International Education Society (CIES), Marianne Larsen, a young comparativist, instructed us and the larger community of comparative educators in these words:

At the 2000 CIES Conference, Rolland Paulston encouraged us to use our imaginations to envision new spatial, visual, and discursive forms of truth, while Andreas Kazamias proclaimed that we needed to reinvent the historical in comparative education so that we can better understand the world. While we may initially conclude that these two approaches are completely divergent, this is not entirely the case. Within the wider discussions about the future of comparative education, there are multiple methodological and epistemological choices for all comparative researchers. We have much to gain from challenging the barriers that limit wider debate and dialogue. Comparative education could benefit from both reinventing our past tradition of historical research, while imaginatively adopting the pluralistic stance, multi-interpretive strategies and general incredulity towards totalizing meta-narratives that post-modernism brings to the social scientific tradition (Larsen, 2001).

THEN AND NOW: UNIT IDEAS AND COMPARATIVE EDUCATION

Robert Cowen

Introduction

We have never seriously developed, in comparative education, comparative interpretations of the educational processes patterned by tyranny, war, or revolution. Why not? We do not have a comparative education which offers comparative understandings of educational processes of city states (whether Italian or Greek). Why not? We have lots of narratives about education in small states. Have we ever aspired to a comparative education of big states? We have some analyses of colonialism and its educational patterns. We have nothing serious and comparative on empires. Why not?

In other words, we have only seen some social spaces, only some social times, and only some political processes. Are there any ways to understand that? What have been our rules of epistemic order and what social processes have helped to frame them and our shifting agendas of academic attention? And now – what might we worry about, other than the fact that there are simply not enough people to do the work that needs to be done.

Then and Now

There were once some simple stabilities, comforting certainties, in comparative education: there were methodologies. In London, it was wise, as an MA student, to know your positivist science (bad) from your hypothetico-deductive science (good). Overall, methodologies served as a vital exclusionary principle: knowledge of that literature distinguished comparative educationists from other academic tribes (such as sociologists).

There was a second certainty in comparative education in the mid-1960s: all comparative educationists would acquire strong area-specific knowledge about areas in which they did not live. They would look outwards, for example, to Eastern Europe and the USSR, or to France and Germany, or to Japan or to China. Ideally, that meant residence there, the acquisition of the relevant languages, and a delight in knowing the foreign culture. Thus the autobiographical capital of one expatriate generation of comparative educationists (Bereday, Hans, Kandel, Lauwerys, and so on) was made into the expected, routinised, institutionally transmitted, intellectual capital of the next generation. These themes can be traced in the recommendations of George Bereday

(1964) in Teachers College Columbia for the training of doctoral students and in the 'comparative education' staffing of that institution at its peak. In the comparative education department in London the same policy of recruiting area specialists – normally an epistemic disaster – was used in the same time period. Overall, however gained (and it might be gained through a first degree in languages or in experiences as a member of the Armed Forces and it still helped to be 'foreign' and an immigrant), area-specific knowledge of 'foreign' places was a vital exclusionary principle: it was knowledge which distinguished comparative educationists from other academic tribes (such as sociologists).

The consequence of these two patterns was quite extraordinary. Even the golden glow of memory, and the genuine pleasure I had as a student in learning, thinking, and talking about France and Japan or the USSR or the USA or about philosophies of science and about methodologies cannot hide how intellectually dull was the literature that was being produced. Of course – to criticise only friends – Nigel Grant's well-written book on the USSR (1968) was longer and more detailed than Janusz Tomiak's subsequent book (1972) on the same place, but it was and is difficult to find a sustained intellectual argument in either text. W. D. Hall's books on France (1965, 1976) were extremely well informed, but what was their theoretical argument? Such books were among the best of their kind, but they were books of narrative. They constituted a sort of comparative education waiting-to-happen, the nadir of which was probably the effort to put together standardised descriptions of educational systems in particular regions, with some comments on social context (McLean & Cowen, 1983).

The 'Anglo-Saxon' methodological literature was also a distraction from the important task of creating a comparative education with a complex intellectual problematic. The methodological literature took up a lot of time and journal space – in a period when there were very few persons specialising in comparative education. The methodological debate also constructed a sort of comparative education-in-waiting. However, what was being waited for never showed up. Comparative education had one of its discontinuities.

Nevertheless in the mid-1960s the field of study, to define itself inside the university (in places such as the USA, Canada, the UK, and Australia), needed to offer apparently distinctive methodological approaches at a time of severe competition for prestige and university space between the philosophy of education, the history of education, sociology of education and psychology – the so-called foundations of education (Cowen, 1982). When the people in comparative education were from all over the place (literally and also) in terms of their original academic disciplines there was apparently, as measured by the flurry of publication (Fraser, 1964; Brickman, 1966; Fraser & Brickman, 1968; Hausmann, 1967; Noah & Eckstein, 1969), a need 'to have a history' and to have specialist methodologies.

As a crucial caveat, it should again be noted that the full comparative history of comparative education has not yet been written. So, later, it would be important to trace the ways in which these propositions were not true even of, say, France, the Nordic countries, Italy, Spain, and Germany (and of course Japan and South Korea, China and the USSR). In much of Europe, and certainly in West Germany, the internal

sociology of the university and the philosophic grounding of 'educational studies' were producing a different academic tradition in comparative education (Mitter, Rust, in these volumes) although the German agenda of external attention (its 'area-studies') rapidly followed political lines of power. Both propositions are true for East Germany too, of course, for different reasons.

As it happened, while the English-speaking field of study was reinventing itself around its new histories and its new approaches, there was a rapid shift in the 'reading of the global'.

Comparative education (as in West Germany) was suddenly being re-shaped by new lines of international power and foreign policy and the availability of research funding. That changed what was studied and researched: Latin America, China, Japan, Southeast Asia, the Middle East, and Africa became newly salient. There was international competition for international influence, not least in Africa, the Middle East, and in the Indian subcontinent. In the Institute of Education in London, for example, changing epistemic labels reflected changing international politics: the former 'Colonial Department' was replaced by 'education in tropical areas' which rather rapidly mutated into 'education in developing countries'. Later, this labelling changed again, at least twice.

More generally, the word 'international' was not only taken into departmental titles – as happened off and on in the Institute of Education in London – but also into professional discourse as a definer of a field of action and influence. Fascinatingly, this occurred more and more in the titles of more and more professional Societies (Manzon & Bray, 2007).

Given those sharpened foreign politics, the shift into 'education and development', and the obvious ability to describe specific cultural contexts and educational patterns, and its new pretensions to scientific status, 'comparative education' was in a better position to make claims for university resources – but the price was high.

First – and it took some time for the epistemic consequences to become clear – 'comparative and international' education was politically positioned in terms of US and British foreign policy very differently from the earlier academic and pedagogically centred study of comparative education in the English-speaking world in universities such as La Trobe University in Melbourne, some Canadian universities, and in a few universities in Scotland, Wales, and Northern Ireland.

Second, this new political context – and the substantive 'research' agenda derived from international politics, the involvement of governments in 'development', and the sharper *political* competition (Fraser, 1965) for international students – highlighted a strange *lacuna*: there was no clear, agreed, intellectual agenda of attention of any theoretical complexity within English-speaking academic comparative education itself. The plea by Noah (in 1974) to pursue 'loose fish' was extraordinarily revealing.

Third, there was very little work being published, apart from some short and very good papers, which combined theoretical and conceptual clarity with a comparative interpretation; in other words, there were few papers being published that were deliberately theory-oriented and these were mostly by sociologists, including R. H. Turner (1964) analysing sponsored and contest mobility; Earl Hopper (1971) typologising educational systems; and several of the essays in Halsey, Floud and Anderson (1961)

interpreting the apparent imperatives in the relation of industrial economies to educational systems. These essays helped to begin to put the narrative genie – the infinitely extendable project of writing up accounts of specific local contexts – back into its bottle (for the time being), and the methodological debate was interrupted by a shift in intellectual attention marked by the writings of Carnoy (1974) on cultural imperialism, Altbach and Kelly (1978) on colonialism, and finally Robert Arnove (1980) in a serious theoretical essay discussing world systems analysis.

Clearly, changes were occurring in comparative education but some of the motifs were coming from ‘outside’. There were at least four such ‘outside’ influences.

Firstly, some ideas were appearing that had not normally been utilised in comparative education (in North America and in Western Europe) and those ideas included Marxism and inspired variations on it by, for example, Paulo Freire. There was a Marxist motif in the writings on colonialism which were themselves an anticipatory grace note on the important question raised by Arnove (1980) about a comparative education which looked at a hierarchical international world of power. Secondly, and as indicated already, some of the best comparative writing of the period was coming from sociologists. For example, Turner and Hopper were analysing comparatively the social contextualisation of ambition – a theme not normally explicitly explored (then) in the comparative education literature. Thirdly, there was a flurry of comparative work from historians of education. This again was a body of work offered by persons whose self-identification was from outside of comparative education. The scholars included Wilkinson (1964, 1969), Vaughan and Archer (1971), Ringer (1979), and Scotford-Archer (1979). The fourth influence – also external to comparative education unless some work by Kazamias on Turkey (1966) is included here – was the analyses of the collapse of the social structures of agrarian societies with the ‘advance’ of modernisation, construed sociologically, historically, comparatively and superbly by scholars such as Skocpol (1979) as social revolutions. There was also excellent work being done on ‘black swan’ countries whose histories contradicted conventional modernisation theory – for example, by Beasley (1972, 1975) and Hall and Beardsley (1965) on Japan.

Thus, ‘comparative education’ was revitalised intellectually from ‘outside’ in the sense that it was for the first time sensitive to a range of theories of *dependencia* from Latin America, taken up and reworked in North America. A new generation of scholars who had experienced the 1968 student movement reconfigured colonialism: this was now no longer to be seen as a slightly unfortunate social fact which had existed before seriously liberal and theoretically informed education and development projects could begin (or worse, be planned) for the ‘Third World’. Now finally, within comparative education, colonialism was interpreted as a major social and historical force, which had shaped countries and educational systems and identities, and these forces and their consequences needed sustained, theoretical, comparative exploration. In parallel, the themes of revolution and the sociological and historical shifts into modernity, beginning in the nineteenth century and continuing into the twentieth were becoming available for comparative exploration – by comparative educationists, that is. Up to this point the literature of comparative education had been a little thin on revolutions – although, as usual, good narrative historical accounts can be found (Barnard, 1969; or even – though this was not the main point of his text – Passin, 1965). The insertion

of colonialism and world systems analysis (of the kind which Arnove was outlining) was very promising in the sense that such perspectives would, almost axiomatically, address international political, economic, and educational relations simultaneously.

These, then, were all clear intellectual and theoretical re-positionings – coming from ‘outside’ – of what would count as good work in comparative education. What was being rejected?

Assumptions about the social universe and the purpose of comparative education included four ‘rules of order’ which had shaped the field in its academic discourses in the 1950s and most of the 1960s – as well as covertly affecting most of the methodological discourse and shaping the mid-Atlantic project of the *(World) Yearbooks of Education* of that period. The rules of epistemic order included construing time as an arrow; educational reform as a series of gradualist linearities; social and educational systems as evolving equilibria; and the assumption that the purpose of comparative education was to reform educational systems.

Gradually all of these assumptions fractured in academic comparative education (if not in ‘international’ education) in the subsequent decade, partly as a result of the intellectual challenges identified above. These challenges disturbed the low level problematique that comparative education had been content to busy itself with: describing educational systems and educational policy and ‘contextual dynamics’; noting ‘similarities and differences’; and of course rehearsing and reprising its ‘methodological moment’: which in retrospect and at first glance seems to be merely a moment of slightly fractious discussions between people of wildly different cultural and disciplinary backgrounds about how to understand what (if it was to be called ‘comparative education’).

These outside influences helped to re-balance the agenda – the triad of what I called earlier in these volumes ‘transfer, translation and transformation’. This triad of relations was being made freshly visible (not least through the theme of colonialism). However, our concern with the triad was much longer and deeper: the Prussian elementary school, of interest so long ago, was ‘comparative’ in that sense. It too had raised the issues of transfer, translation, and transformation. But that agenda had become temporarily obscured, not least by the ways in which Jullien and Sadler had been interpreted as ‘the histories’ of the field were being constructed.

Primarily the outside influences sketched above were intellectual, but it should also be noted that they affected the field at a time when there were major shifts in world politics: the Cold War was changing shape and constructing cultural and economic and political competition in terms of what would now perhaps be called ‘soft power’ in parts of East Asia, notably Japan, and Korea, and in Africa, and in much of Latin America. ‘Satellite or proxy wars’ (if such technical terms may be used of wars which killed so many people) were becoming a visible pattern; and the Vietnam War itself was achieving major international visibility.

These major political changes suggested a re-reading of the global which began to redefine ‘comparative education’. Partly as a consequence (and occasionally as a scandalous consequence) academics were being newly used by Western, liberal, and democratically elected governments as applied social scientists. This process began to include ‘comparative and international’ educationists in increasing numbers.

Thus the breakout from an almost compulsive concern with methodology and the interminable descriptions of context – which in my view followed from a highly ideological overvaluation of the ‘living spirit’ aspect of the problematique which Sadler (Higginson, 1979) had posed in his short essay on ‘how far can we learn anything of practical value’ – was through the double-disturbance of new epistemological options and a different reading of the global. The theme of colonialism in that sense was the symbolic marker of a major shift in the field – but the field was pulled into new patterns of research and agendas of intellectual attention and anxiety not merely by an epistemic shift but also by political shifts.

Now and Then

Overall, it can be suggested that this happens – ‘now and then’, to borrow a vernacular expression – in comparative education. That of course raises the question of when and why ‘now and then’ occur. And it raises another problem – these jumps, or irregularities look at first as if they fracture the field: they must be abnormal because these moments are when our Shameful Discontinuities occur and clearly discontinuities are bad (are they not?).

It might be more analytically useful to suggest that discontinuities are productive and necessary. Not only will they happen anyway (the social world changes faster than our theorisations of it), but they are also very stimulating – as has just been argued. The discontinuities mark a double-shift: a shift in *episteme* which is our normal concern, the thing we normally discuss; and a shift in international politics which we also talk about professionally – but which we rarely snap analytically together with the changes in epistemic assumptions within the field.

In other words, the interpretative argument which is being proposed here is that comparative education and its re-stimulation and rebirths – and thus its new potentials – are far from being Shameful Discontinuities which are a special problem for us in comparative education. Rather, they are analytically understandable.

Typically, however, we see our history and ourselves in a rather peculiar way. Even noting that new generations of scholars have to make intellectual room for themselves, we have in comparative education probably gone too far in so frequently contrasting two singularities – a ‘before’ and an ‘after’. One way and another, we have invented quite a range of labels to identify a number of proposed singularities. The process began early with the invention of categories such as ‘the precursors’ (Noah & Eckstein, 1969). We still find the shifts from one singularity to another to be puzzling, and we tend to anguish about the discontinuities – one marker of which is, at such moments of bewilderment, the creation of ‘state of the art’ issues of the journals – unless, that is, a millennium is immediately at hand. The markers may also include new claims about the importance of a missing perspective (e.g., sociology or anthropology or feminism or postmodernism), there will be *cris de cœur* in opposition or in reproof, and the field may ‘read the global’ and think about itself in a fresh way. However, it is probably important to emphasise that an epistemic claim is not in itself sufficient – academics in particular make new epistemic claims all the time. The double-shift of new epistemic claims and of a new reading of the international political economy is necessary.

Hypothetically (again, given the absence of a comparative history of comparative education) it can be suggested that – with strong local variation such as in Canada, mainland China, Germany, and South Africa where either the sociology of university knowledge was different or there were different political challenges – there have been three such moments since 1945.

One has already been illustrated to give some sense of the complexity of what would have to be traced in looking at the shift away from concern for methodologies and narratives about ‘context’ (in Edmund King’s vocabulary, ‘cultural envelopes’), into a concern for colonialism, the histories and sociologies of societies moving from feudalism to various forms of ‘modernity’, and world systems perspectives. It was suggested earlier that these epistemic disturbances were also affected by major international political events, such as the ways in which the Cold War took shape sociologically, in new patterns of international political relations – to be fought by proxy (and brutally) in some places and softly, by cultural and educational policies, in others.

The Second Discontinuity – another set of ‘outside’ possibilities or potential influences – was drawn to the attention of comparative educationists particularly by Val Rust’s (1991) very alert list of things that might define the beginnings of postmodern moments in the field of study. Outside of comparative education, multiple epistemic claims were on offer for fresh ways to think. Rust traces those claims well: the eclectic surface structure of Rust’s article represents accurately the astonishing eclecticism of the epistemic options which were being discussed ‘outside’ of comparative education.

However, the early 1990s were also a moment marked by a massive historical shift in contemporary power structures, notably in Europe, and the emergence of new forms of ‘state’ – including regional ‘states’ and a new salience for post-socialist states (Birzea, 1994; Karsten & Majoor, 1994; Mauch & Sabloff, 1995; Sting & Wolf, 1994). In other words, new state formations – including the European Union – were rapidly identified as a normal puzzle of the field, and the reading of the global and the new political shifts in Europe rendered temporarily invisible some of the epistemic claims within the range that Rust had identified.

The Third Discontinuity might, in a full (future) analysis, be identified as the moment when the politics of the economic changes termed ‘globalisation’ overlapped with the mature politics of neo-liberalism by the mid-1990s (OECD, 1996, 1996a). Whilst these shifts in the international political economy were being analysed, the second, and of course later, part of the double-shift – the epistemic competition took place.

There were two very different claims. One was that it is a rationalised world of effective and efficient schooling, of measurement and evaluation – even a world in which educational systems should be replaced by skill-formation systems. Thus the correct way forward for comparative education would be to strengthen empirical research that collects robust and relevant data of especial use to policy-makers. These motifs are extremely well explored, with a sharp critical sense, in the recent *World Yearbook* on educational research and policy and steering the knowledge based economy (Ozga, Seddon & Popkewitz, 2006); and more briefly in Hartley (2004) and in St Clair and Belzer (2007).

There was also a clear and strong counterclaim which drew from a major academic literature and new thinking within educational studies and comparative education: that

it is a postmodern world (e.g., Edwards & Usher, 2000) and postmodern approaches are the way forward for comparative education (e.g., Ninnis & Mehta, 2004).

Of course there are important caveats to be made about ‘a discontinuity’, any discontinuity – shameful or otherwise. As the history of heresies tends to show (viewed either from the perspective of the heretics or from the perspective of whichever is the true church at the time) things do not just stop. And then totally change. There are routine continuities. The excellent work of the historians who were thinking comparatively is one example, as well as continuing claims about the importance of an historical perspective. That work continues in the writing of Muller and colleagues (1987), Andy Green (1990), and the strongly argued themes of Kazamias (2001). Similarly, continuing concerns for identity are easily identifiable not merely in the cultural motifs of the writers from within the London school of comparative education (Lauwerys, 1965) but, for example, in the later and original thinking about comparative education and the editorial decisions of Burns and Welch (1992), in the ‘colonial’ literature (Mangan, 1993), and in the excellent analysis of Fortna (2000) which is remarkably good in that it offers a grasp of the relationships between social structures, history, and educated identity. These questions of identity included, very powerfully, the theme of gender (see Stromquist in these volumes) and knowledge and legitimacy and class and the State (Welch, 1992, 1993). There were even early questions about comparative education as an applied science (Cowen, 1973) and later ones about methodology (Holmes, 1981).

And So?

And so – it would seem in 2007 – we are yet again in a discontinuity. We not only have a double-shift: clear epistemic claims (Ninnis & Burnett, 2003) but also a change in the international political economy and how that is ‘read’ (Coulby, Cowen & Jones, 2000; Dale & Roberston, 2005). We also have ‘markers’ of something being wrong: strange *lacunae* have been noted (Cook, Hite & Epstein, 2004) and at least one very clear *cri de cœur* has been offered (Epstein & Carroll, 2005). We have a moment, in other words, reminiscent of the moment mentioned earlier when Harold Noah expounded his theory of ‘fast fish and loose fish’, and of the other moment not mentioned earlier when Psacharopoulos (1990) pointed out the futility and irresponsibility of thinking vague thoughts when comparative education could be rooted in the real world. His real world, that is.

I personally do think we are in a moment of what I am calling a ‘discontinuity’ (although obviously the evidence is still emerging, not least in the literature which is coming out in the journals). However, I think this current ‘discontinuity’ contains an interesting reversal in our normal sense of (and disappointment in) ourselves.

Currently, it may be worth stressing that comparative education is confident as an ‘applied science’ – though it should not be (Cowen, 2006) – and a bit anxious about its epistemic identity when, it will now be argued, it should not be.

To take the argument forward, where might we start, other than by re-reading almost all the chapters in these volumes? Or by noting that intellectual work in the field

of study has become more exciting than it has been for some time (e.g., Arnové & Torres, 2003; Burbules & Torres, 2000; Charle, Schriewer & Wagner, 2004; Coulby & Zambeta, 2005; Dale & Roberston, 2005; Jones, 2007; Paulston, 1999 [reprinted in these volumes]; Ninnes & Mehta, 2004; Nóvoa & Lawn, 2002; Ozga, Seddon & Popkewitz, 2006; Phillips & Ochs, 2004; Phillips & Schweisfurth, 2006; Schriewer, 2006; Steiner-Khamsi, 2004).

We could start with my cliché (though I hasten to add it was not a cliché when I first wrote it) that there are several comparative educations. We still have, for example, a ‘comparative education’ of solutions offered by agencies such as the OECD or the World Bank; a comparative education of international evaluation – IEA studies and PISA and the effective and efficient schools movement is not yet dead; a ‘comparative education’ of the politically sanctified or politically correct dichotomised binaries (traditional/modern; developed/developing; capitalist/socialist; East/West; North/South); and a specialist and good ‘comparative higher education’ literature.

Nevertheless, it is possible to suggest what is rarely suggested – that there are some basic and relatively invisible assumptions which frame much of the academically driven comparative education in any given time period. The ‘normal-puzzles’ of any one time period vary, but there are certain basic themes which all scholars in comparative education have explored over a long time period: there is a surprisingly similar deep agenda.

In other words, I am suggesting that academically driven, university-based, forms of comparative education with whose literature we typically concern ourselves is focused around a rolling and shifting agenda but that this agenda alters within and around a constellation of core ideas.

It is these core ideas in the field of study which almost unite it – and which also permit an understanding of its little tectonic plate shifts, what I have called here its discontinuities. The discontinuities occur within a basic frame of ‘unit ideas’ used in comparative education. (I acknowledge with pleasure that the phrase ‘unit ideas’ is taken from Robert Nisbet (1967) and his brilliant book *The Sociological Tradition*.)

I have suggested elsewhere (Cowen, 2002) that the unit ideas of comparative education are:

- Space
- Time
- The State
- Educational system
- Educated identity
- Social context
- Transfer
- Praxis

What happens at any particular moment is that one or a couple of these unit ideas become almost invisible.

For example, when I wrote about ‘time’ in comparative education in the early 1980s (Cowen, 1982) the issue of concepts of time was almost invisible except for some remarkable thinking in sociology (Martins, 1974). Comparative educationists did not

do time (they did space). Historians ‘did time’ (to borrow a phrase): time was part of their work agenda. Now it has become very easy to trace concepts of time in the literature (Cowen, 1998, 2002) and there has been an explosion of concern for time and space as a major theoretical problematique in comparative education – see illustratively Sobe and Fischer (and the literature they cite) on space-time in these volumes.

It is possible to work through each of the ‘unit ideas’ showing how each of the concepts has been defined in the past and how our use of the concepts has trapped us into certain kinds of work or certain perspectives – although things are loosening up rapidly. For example, the concept of ‘the State’ in comparative education from its naive treatment in the inter-war and post-1945-war literature has been shaken by post-structuralist perspectives – and the obvious fact of the growth of regional forms of governance. The theme of ‘empire’ (as a political formation) is attracting new visibility in the historical and social sciences – and attention has recently been given to global forms of governance (Jones, 2007). The theme of a ‘market state’ is also almost certainly worth a full exploration (Bobbitt, 2003).

Similarly, I earlier suggested (in one of the short editorials in these volumes) that the concept of ‘educational system’ had helped to trap us into a modernist comparative education that implicitly ruled out explorations of education in the city states of Italy; or the education of the courtier in eighteenth-century France or in Tokugawa Japan; or a comparative analysis of Athens and Sparta and what I would call their ‘educational Rosettas’; or the education of elites and the social use of what is too casually called a *lingua franca* – Latin – in the Roman Empire and afterwards (Heather, 2005; Waquet, 2001). What is required, of course, is to rethink the concept of ‘educational system’ and the assumption that our praxis is to reform such systems. We thus, by extension and immediately, broaden the range of ‘states’ – the political formations – which we think of as worthy of attention. For example, our comparative education is peculiarly limited in another astonishing way – we developed no comparative education theorisation which dealt with tyrants and tyranny and the associated educational patterns – and this in a century that contained Hitler and Stalin and Mao. Similarly we developed no comparative theorisations (in comparative education) of educational processes constructed by ‘men on horseback’ – and this was in a century of interventions in politics by the Brazilian, the Greek, the Japanese and the Turkish armed forces, even though the hints were there in the social science literature (Voigt, 1939; Lipset & Solari, 1967).

However, the crucial strategic point is that all of the unit ideas now need rethinking. The question is, only partly, what were the earlier thematics of the unit ideas? A crucial question is also what are they becoming?

The ‘unit ideas’ are – all of them – important in thinking through something which is at the core of comparative education: the triadic relations of ‘transfer’ and its double-osmotic problem; the embeddedness of aspects of education in a culture of origin and their insertion into a different social-osmotic pattern which carries its own immunologies or permeologies. We do not know what those immunologies or permeologies are. Thus we are not very clear, at the moment, on ‘translation’ – how the old institution changes in its new context; for example, how the ‘German’ university will change in its new context, the USA or Greece or Sweden. And thus we are completely unclear also on the theme of transformation – though work on ‘shape-shifting’ exists in the literature

(Beech in these volumes; Ishii, 2003; Kim, 2001; Larsen, 2004; Law, 1996; Popkewitz in these volumes; Shibata, 2005; Tanaka, 2005). Without such work, and the unit ideas are crucial to approaching such work, one of our basic concepts in comparative education – shape-shifting – will remain weakly identified, stuck in a narrative phase of thick or thin stories of the shape-shifting of educational institutions and ideas as they travel. ‘Shape-shifting’ is of course a silly idea: nebulous and difficult to conceptualise.

Unfortunately it is probably necessary to tackle the task if we are to comprehend the triadic relations of transfer, translation, and transformation.

Fortunately, Albert Einstein is alleged to have suggested that ‘[i]f at first the idea is not absurd, then there is no hope for it’. So, in addition, to shape-shifting, I think there are two other analytical themes which might help to rethink comparative education currently.

Possibilities and Compressions

One is the idea of ‘transitologies’. A ‘transitology’ can be thought of as a very specific form of ‘revolution’ – but avoids some of the ambiguities of that word. Thus, a transitology could be defined as ‘the processes, within a period of 10 years or so, of the more or less simultaneous destruction and reconstruction of political visions of the future; the state apparatuses (police, army, bureaucracies, political institutions); the economic and social stratification system(s); and the deliberate reform and restructuring of the educational system so that it can be used as part of the construction of the transitology’ (Cowan, 1999, 2000).

The point in such an apparently cumbersome concept is that it permits us to see something else. The time-space compression which is a transitology, somewhat like a lightning flash, illuminates simultaneously the forms of expression of social power (economic, political, cultural) in the ‘educational system’ and it shows, briefly and brilliantly, the *shifts* in those compressions of social power in educational form including, of course, shifts in ‘educated identity’. Thatcher’s Britain, Mao’s Cultural Revolution, Attaturk’s Turkey, the ‘collapse’ of East Germany (Poland, Hungary, the USSR): all these are – subject to sustained scholarly critical review – transitologies.

Thus the theoretical question is: How do you decode those shifts in the compression of social power into educational form? How do you do that, while avoiding describing ‘the educational system’ in the routine categories of comparative description which – as argued earlier in these volumes – overlap with categories useful in the administration, finance and management of primary, secondary, tertiary education?

The question can probably be cracked theoretically if we begin by thinking about ‘educated identities’ (whether classed, gendered, raced or defined by region or religion) and certain crucial educational processes and keeping in mind the Wright Mills problem of making sense of historical forces, social structures, and individual biographies.

Thus, one of the questions gets to be: What were the ‘sacred spaces’ and ‘holy routes’ in the Soviet educational system and what were its forms of ‘consecrated knowledge’? – and so on. (Clearly the model of an ‘educational Rosetta’ is quite complex and must

meet a range of criteria such as covering and comprehending non-elite educational processes.) Here the language in this sketch of possibility is chosen deliberately because of the comparative shock of imposing on Soviet secularities, which the political and economic and social system so much stressed, a vocabulary from another discourse.

Overall, then, I believe it might be possible to develop a theory of educational Rosettas – capturing the codings of social power in educational form. Thus when the shift in educational patterns occurs (in ‘East Germany’ or in states swept up by the World Bank into the knowledge economy) what is potentially revealed are the rules of the grammar of educational systems and the way they osmotically absorb context and the ways they interact with international political, economic, cultural, and educational relations. Such an aspiration – to understand the codings of power in educational forms – necessitates the embracement of post-colonial, postmodern, and post-structuralist lines of analysis which are already revitalising comparative education.

Again, it is an openness question: comparative education must not retreat, intellectually, inwards, onto itself. But nor should it, without the most careful reflection about the social and political role of universities, expand casually outwards so that it accepts, as fit and proper, those topics which the international agencies (or the European Union) say are important problems.

However, such an academic aspiration – to understand shape-shifting and the codings of power in educational Rosettas – is absurd. Good, or at least ‘good’ according to Einstein.

Shape-shifting and the codings of power in educational Rosettas, and returning to the triad of relations (transfer, translation, and transformation) and reading the global in fresh ways – those kinds of absurdities – are among the things that might get us out of the long-running modernist trap in comparative education: the siren call and the Faustian contract of being useful to governments. There are other things to do, including trying to reveal the ways in which compressions of power in certain educational forms stop exactly what they are supposed to be facilitating: education.

Our contemporary ‘crisis’, our current ‘Shameful Discontinuity’ in comparative education is not, for once, the problem of a low level intellectual problematique. Our problem is probably that we have become even more bloated than we were in the late 1980s (Halls, 1989): too many meanings are currently loaded onto the concept ‘comparative education’.

Conclusion

We probably have to recognise three things to help us rethink. One is that the ‘methodological moment’ of the 1960s was not about methodology – but about the meta-narratives of comparative education: meta-narratives which would define its choice of narrative form, the nature of its attempted generalisations; and in counterpoint, as Geogre Parkyn once discussed, those particulars which it was – despite the fact that they were particular – prepared to accept as ‘comparative education’; and the politics of its emancipatory position. What and who were to be ‘emancipated’ by its knowledge?

The second theme is one which was underplayed in my earlier analysis in this chapter and writing this chapter itself has convinced me of its central analytical importance: the university and its work-climate is a crucial part of ‘comparative education’ (Cowen, 1997).

The fascinating theme here would be a full comparison within North America of at least two comparative educations. It is not merely that Canada’s different domestic politics shape Canadian education in a different way from the comparative education of the USA. Nor is it merely the biographies of individuals such as Mallea or Zachariah, Doug Ray or Joe Katz, Hayhoe or Masemann, or David Livingstone or David Wilson which define the field. It is also the Canadian university and its social and pedagogical commitments to a Canadian domestic and political context (Larsen, Majhanovich, & Masemann, 2007; Wilson, 1994) and to Canada’s international political position. The same general point can also be made by emphasising extreme differences in domestic and international politics: it is not merely that the state-socialist USSR, or the Nazi regime or current neo-liberal states have different domestic and international politics. It is also the case that the university in brutal or subtle ways (the Nazi university, the Soviet university, the neo-liberal managed university) abolishes or redefines ‘comparative education’. ‘The university’ does this not only by – *mutatis mutandis* – exiling or shooting scholars, or by limiting intellectual horizons, but also by rewarding scholars in fresh ways.

Currently, for example, maintaining any kind of academically driven intellectual agenda is difficult in a range of neo-liberal states amid the pressures for the social sciences and for educational studies to show that they can be applied. The serious historical question for the university – knowledge applied to what by whom and for what and for whom – is still with us amid the banalities of systems of quality assurance and evaluation as these are currently practised in a remarkable range of countries, and not just England.

The third possibility would be to review those forms of ‘comparative education’ which are called ‘international’. What is the current meaning of this label and what political purposes is it serving? Are those forms of comparative education which are called ‘comparative and international’ now mainly declarative and hortatory? What do concepts of ‘post-development’ mean for the ‘international’? Is ‘international education’ now part of a world movement for the construction of peace? The issue is of vital and strategic importance as Jennifer Chan (2007) – although not in the vocabulary of ‘the international’ – has shown incisively (and delicately) in her analysis of competing epistemes in global governance reforms.

‘Comparative and intercultural education’ as an agenda for the social construction of world interculturality? Clearly there are worse agendas around which to stabilise ourselves – even the social sciences – than the search for social justice and an interculturality appropriate for our times and our place: the world.

However, before we embrace such an honourable – and ancient – vision, it is crucial to see that we have ‘comparative educations’ because what we call comparative education, in its growth, in its shape-shifting, is itself part of international political, economic, cultural and educational relations. It exists at the intersection of international and domestic politics but it has, in its century-old form, a very special and

privileged home: the university and therefore it has had for a century a very special academic shape.

We need that base and we need those earlier shapes and those earlier questions and discussion and some hints of failure: they give us a perspective on the possibilities of being damaged by banalities about academic quality as well as hints about the dangers of being liberated by totalising visions.

Overall, then, this chapter has suggested that there are deep continuities in the academic, university-based, work of comparative education and that the field, which looks every now and then as if it is in terminal crisis, is not. It was, however, suggested in the first half of the chapter that the field itself is exceptionally responsive to the intersection of domestic and international politics, and thus its surface agendas often alter at speed at various times – those ‘discontinuities’ about which we get so anxious. The surface agenda of comparative education is also dramatically different in different places. It is lines of international power, and epistemic shifts, and domestic politics which help us to begin to think about local variations in ‘comparative education’ – as a sustained analysis of comparative education in Canada and the USA (or in East and West Germany) would probably illustrate.

However, the second half of the chapter emphasised some of the strategic, crucial and relatively permanent concepts which, it was suggested, unite the field of comparative education, in addition to the core triad of ‘transfer’, ‘translation’, and ‘transformation’. These themes are called, borrowing from Robert Nisbet, the ‘unit ideas’ of comparative education. Stressing those ideas would permit us to rethink and rewrite a lot of our history.

Stressing those ideas, and perhaps a couple more such as transitologies and educational Rosettas and shape-shifting, might permit us to rethink and rewrite a lot of our future, too.

At the very least, stressing what I am calling the unit ideas of comparative education might also permit us to un-learn; to escape the modernist traps of comparative education which encourage us to retain older assumptions: (i) that thinking about education only after about 1800 is not only normal but intellectually acceptable; (ii) that one of our major jobs is to be useful to democratically elected governments in terms of policy advice; and (iii) that we have a special responsibility for reforming education and people’s lives in other bits of the world. As an academic, I do not accept any of those propositions. Let us hope we can continue to work out, generation by generation, a subtler and more important vision of our political and human and academic responsibilities.

At the very least we should begin to understand that the academic field of study traditionally called ‘comparative education’ is itself part of the international political, economic, cultural and internationally historical relations which it studies. Furthermore, we exist, in universities, as an academic voice much affected in terms of ‘hot topics’ by the intersection of domestic and international politics. That is probably why – more so than, say, sociology as a field of study or philosophy as a field of study – we have such visible ‘discontinuities’. And that is why we need to continue to struggle to comprehend, under our local chameleon-like and varied exteriors, what our more or less permanent agenda is – other than catching locusts (or loose fish) and apparently changing colour now and then.

However, chameleons (if I am correctly informed) do not really change colour. I think we do not either. We have an agenda and in my view it is a permanent one, an academic one, and a worthy one: to reveal the compressions of social and economic and cultural power in educational forms especially as these are most visible in their moments of transfer, translation and transformation. Understanding those processes would permit us to speak truth unto the State; and a few other people as well.

CONCLUSION

Robert Cowen and Andreas M. Kazamias

*For last year's words belong to last year's language, and next year's words
await another voice. And to make an end is to make a beginning.*

T. S. Eliot, "Little Gidding"

Un-learning is, of course, the problem. When you sit down to write a book, a thesis, an academic paper, normally you just pencil in the words 'Introduction' and 'Conclusion', and then you concentrate on the main ideas or interpretative argument or sources of evidence which will substantively construct the main body of the paper or the thesis or the book. Normally, the assumptions work. Get the core ideas and sources of evidence of the piece right and then you can do the introduction and the conclusion later.

Un-learning is of course the problem, here. Handbooks do not work like that.

Part of the point of a Handbook is looking backwards (what has been done in this field of study, where are we up to?). But a Handbook looks forward, too. Handbooks contain powerful conditionalities: 'if we were there ... if we are almost up to here now ... then we should move on to explore.' In practice then Handbooks are oriented towards the future.

This is true even of the flaws in Handbooks. Handbooks automatically invite strong criticism which might emphasize that some themes are missing – social cohesion, early childhood education, fragile states, terrorism; or that some themes have been underestimated: post-structuralism, postmodernism, post-developmentalism, post-feminisms, post-Marxisms and so on. Such critical comments reclaim and reposition the future of the field.

Such claims are, in principle anyway, to be welcomed precisely because a Handbook is not a conclusion. A Handbook is not intended to freeze a field, to fix a canon, but to rehearse and then release a field of study. A Handbook might contain a reordering and a refreshment of the past; but it must address possible futures and it must pose new challenges. New comparative educations not imagined in this Handbook can – and will – be created.

However, some of the questions and themes of this Handbook are not likely to go away. They might – and should – run on into the future. With whose other academic voices does comparative education overlap and intersect? Whose categories of analysis frame its thought? What are, will, or should be, the 'hot topics' of comparative education and why: who says they are hot? With what independence, and with which other agents, does comparative education act upon the world?

The theme which unites these questions is not merely understanding the sociology of university knowledge, but also the perennial problem of the politics of knowledge, the problem of deciding what, these days, in our political times, is the emancipatory potential of comparative education. Most new social theories, all political parties and some international agencies make claims about their emancipatory potential; and ours? We know our old answers about ourselves, as a field of study. What are our claims now?

APPENDIX**Table 1.** Returns to investment in education by level, full method, latest year, regional averages (percentage) (Psacharopoulos & Patrinos, 2002: 14)

Region	Social			Private		
	Primary	Secondary	Higher	Primary	Secondary	Higher
Asia ^a	16.2	11.1	11.0	20.0	15.8	18.2
Europe/Middle East/North Africa ^a	15.6	9.7	9.9	13.8	13.6	18.8
Latin America/Caribbean	17.4	12.9	12.3	26.6	17.0	19.5
OECD	8.5	9.4	8.5	13.4	11.3	11.6
Sub-Saharan Africa	25.4	18.4	11.3	37.6	24.6	27.8
World	18.9	13.1	10.8	26.6	17.0	19.0

^aNon-OECD.**Table 2.** The coefficient on years of schooling: Rate of return (based on Mincer-Becker-Chiswick), regional averages (Psacharopoulos & Patrinos, 2002: 15)

Region	Mean per capita (US\$)	Years of schooling	Coefficient (%)
Asia ^a	5,182	8.4	9.9
Europe/Middle East/North Africa ^a	6,299	8.8	7.1
Latin America/Caribbean	3,125	8.2	12.0
OECD	24,582	9.0	7.5
Sub-Saharan Africa	974	7.3	11.7
World	9,160	8.3	9.7

^a Non-OECD.**Table 3.** Returnstoeducationbygender(percentage)(Psacharopoulos & Patrinos, 2002: 16)

Educational level	Men	Women
Primary	20.1	12.8
Secondary	13.9	18.4
Higher	11.0	10.8
Overall	8.7	9.8

BIOGRAPHICAL NOTES

Robin Alexander is a Fellow of Wolfson College at the University of Cambridge and Professor of Education Emeritus at the University of Warwick. He was formerly Professor of Education at the University of Leeds. In 2002 his *Culture and Pedagogy* won both the American Educational Research Association (AERA) Outstanding Book Award and First Prize in the (UK) Society for Educational Studies Book Awards. He is currently directing the Primary Review, an independently funded enquiry into the condition and future of English primary education and the largest such enquiry for 40 years. His other books include *Learning from Comparing* (two volumes, with Patricia Broadfoot, Marilyn Osborn, and David Phillips, 1999 and 2000), *Policy and Practice in Primary Education* (1997), *Versions of Primary Education* (1995), *Change in Teacher Education* (1984), *Primary Teaching* (1984) and many others. His *Essays on Pedagogy* was published in 2008. See www.robinalexander.org.uk, www.primary-review.org.uk.

Michael W. Apple is John Bascom Professor of Curriculum and Instruction and Educational Policy Studies at the University of Wisconsin, Madison and Professor of Educational Policy Studies at the Institute of Education, University of London. He has written extensively on the relationship between knowledge and power in education. Among his recent books are *The State and the Politics of Knowledge* (2003), *The Subaltern Speak: Curriculum, Power, and Educational Struggles* (2006), *Educating the "Right" Way: Markets, Standards, God, and Inequality*, 2nd edition (2006), and *Democratic Schools: Lessons in Powerful Education*, 2nd edition (2007).

Robert F. Arnove is Chancellor's Professor Emeritus of Educational Leadership and Policy Studies, Indiana University, Bloomington. He is an Honorary Fellow and a Past President of the Comparative and International Education Society (CIES), and a past chair of the Special Projects Committee of the World Council of Comparative Education Societies. He has served on the editorial boards of the *Comparative Education Review* and *Compare*. He has written extensively on educational and social change, with a special focus on Latin America. He is the lead editor of *Comparative Education: The Dialectic of the Global and the Local* (now in its third edition).

Jennifer Ashkenazi, a graduate of the Department of Educational Policy Studies at the University of Wisconsin-Madison, completed her PhD in August 2007. Jennifer received both her BA and MA from UW Madison, in German Literature and in Educational Policy Studies, respectively. Her dissertation is a comparative-historical study of modern Turkish educational policies and the continued presence of Islam within the officially secular national education system during the twentieth century. Jennifer has been studying and working in Istanbul and Ankara, Turkey, and in Jerusalem, Israel for the past four years. She is interested in the development of national education and education policies of various Middle Eastern countries, examining in particular the policies of religious education in individual nations. She is also researching the educational policies of the European Union, especially the education of Turks in Germany, as a case study of the education of foreigners and immigrants in the EU.

Wayne Au is an Assistant Professor of Secondary Education at California State University, Fullerton, USA. He is an editor for the progressive education journal, *Rethinking Schools*, writes extensively on critical educational theory and social justice education, and is author of the forthcoming book, *Unequal By Design: High-Stakes Testing and the Standardization of Inequality* forthcoming from Routledge.

Leslie Bash is Principal Lecturer in Education at Anglia Ruskin University where he is programme leader for the doctorate in education and supervises a significant number of international PhD students. After graduating in sociology from the University of London he qualified as a secondary social studies teacher and subsequently taught in urban schools while undertaking postgraduate studies in comparative education. For the last 25 years he has worked in teacher education and has pursued research interests in, and has written on, aspects of education policy; teacher education; urban education; education and work; and the links between ethnicity, nationhood, and education systems. More recently, his work has focused on globalisation and intercultural encounter in education, with contributions to recent international conferences and the 2005 World Yearbook of Education. His publications include: *The Education Reform Act* (with David Coulby) and the *World Yearbook of Education: Youth, Education and Work* (ed. with Andy Green).

Jason Beech is Director of the BA in Education in the Universidad de San Andrés in Buenos Aires, Argentina, where he also teaches Comparative Education and Education Policy. He has a PhD in Comparative Education from the Institute of Education, University of London. His main interests are the transfer of specialised knowledge about education in the global educational field and conditions of reception in different local contexts. He has published articles and book chapters in Argentina, Brazil, Denmark, Spain, Switzerland, the UK, and the USA.

Deevia Bhana teaches Gender and Education at the University of KwaZulu-Natal, South Africa. She writes on gender, childhood sexualities, and HIV/AIDS.

Patricia Broadfoot has been Vice-Chancellor of the University of Gloucestershire, UK since September 2006. She was previously Professor of Education and Pro Vice-Chancellor at the University of Bristol, UK. She holds a Bachelor degree in

Sociology from the University of Leeds, a Masters in Education from the University of Edinburgh, a PhD in Sociology of Education from the Open University, UK and a Doctor of Science degree from the University of Bristol.

She has written widely in the field of Comparative Education, especially comparative studies of aspects of the education systems of England and France including jointly authored books: *Perceptions of Teaching: Teachers' Lives in England and France* (1993); *Promoting Quality in Learning: Has England Got the Answer?* (2000); and *A World of Difference? Comparing Learners Across Europe* (2003). She was Editor of the journal *Comparative Education* from 1992 until 2004 and the President of the British Association for International and Comparative Education from 1996 to 1997.

Andrew Brown is a Professor of Education, and Dean of the Doctoral School at the Institute of Education, University of London. He is a sociologist exploring the relationship between everyday professional and academic discourse and practice and the (re)production of social relations. His areas of interest include parental participation in schooling, doctoral and research education, and the uses of digital technology. Publications include *Professional Doctorates: Integrating Professional and Academic Knowledge* (with David Scott, Ingrid Lunt, and Lucy Thorne, 2004, McGraw-Hill), *Digital Technology, Communities and Education (World Yearbook of Education 2004)* (co-edited with Niki Davis, RoutledgeFalmer) and *Doing Research/Reading Research: A Mode of Interrogation for Education* (with Paul Dowling, 1998, RoutledgeFalmer – second edition forthcoming). He has worked as an international consultant on teacher education, school development, and research capacity-building projects in Bangladesh, Brazil, Indonesia, Japan, Kenya, and South Africa, and has taught on masters and doctoral programmes in Brazil, China, and South Africa.

Jim Carl is an Associate Professor and Chair of the Department of Curriculum and Foundations at Cleveland State University, Cleveland, Ohio. He focuses on the nineteenth-century origins of mass schooling in Europe and the United States as well as the history and politics of urban school reform in the post-World War II era. Currently, Carl is sorting out the social and political forces behind school voucher programs in four U.S. states – Louisiana, New Hampshire, Wisconsin, and Ohio – as part of a larger study tentatively titled “Freedom of Choice: Vouchers Movements in American Education, 1955–2002.”

Dr Nazir Carrim is a Senior Lecturer at the School of Education of the University of the Witwatersrand, Johannesburg, South Africa. His field of expertise is in sociology of education and his current research interests and teaching is in the area of human rights (in) education, identities and policies in education and processes of educational reform in South Africa. He has published in journals such as *Compare*, *Cambridge Journal of Education*, *Race Ethnicity and Education*, and *International Studies in Sociology of Education*. He has recently been involved in an international collaborative research project on inclusion and exclusion in education between South Africa and India, and another on democracy, human rights, and citizenship education with Sweden, Yugoslavia, Bosnia-Herzegovina, and Mozambique.

Claudio Mourais Castro is a Brazilian economist. He has a Masters Degree from Yale University and has a PhD in Economics from Vanderbilt University. He has taught at the Catholic University of Rio de Janeiro, the Vargas Foundation, the University of Chicago, the University of Brasilia, the University of Geneva, and the University of Burgundy (Dijon). He was a former Chief of the Training Policies Branch of the International Labour Office (Geneva). He has worked in a Technical Division of the World Bank and was Division Chief of the Social Programs Division of the Inter-American Development Bank. Presently he is the President of the Advisory Council of *Faculdade Pitágoras*. He has published over 35 books and around 300 scholarly articles, mostly on education and vocational training.

Linda Chisholm is a Director in the Education, Science, and Skills Development Research Programme at the Human Sciences Research Council, South Africa. She has played a key role in national curriculum review and revision processes. She is a previous Chair and Professor of Education at the University of KwaZulu-Natal and Director of the Wits Education Policy Unit. She has published widely on education policy change, curriculum, teachers and management, youth and gender. Her books include the edited collections *Changing Class: Education and Social Change in Post-apartheid South Africa* (2004) and *Gender Equity in South African Education, 1994–2004* (2005).

Michael Crossley is Professor of Comparative and International Education and Joint-Coordinator of the Research Centre for International and Comparative Studies at the Graduate School of Education, University of Bristol, UK. Professor Crossley is the current Editor of *Comparative Education* and was Chair of the British Association for International and Comparative Education (BAICE) from 2002 to 2004. He is a member of the Editorial Board for *Compare* and the *International Journal of Educational Development* and a founding Series Editor for the *Bristol Papers in Education: Comparative and International Studies*. Professor Crossley has published widely in the field and undertaken teaching, research, and consultancy work in numerous countries worldwide. Major research interests relate to theoretical and methodological scholarship on the future of comparative and international education; research and evaluation capacity and international development cooperation; and educational development in small states. In 2005 he was elected as an Academician (AcSS) by the UK Academy of Learned Societies for the Social Sciences.

David Coulby is Professor of Education and Head of International Activities at Bath Spa University, UK. From 1994 to 2005 he was one of the two Series Editors for the *World Yearbooks of Education* series. Since 1995 he has been an Editor of *Intercultural Education*. His most recent books are *Beyond the National Curriculum: Curricular Centralism and Cultural Diversity in Europe and the USA* (Falmer, 2000); *Education and Warfare in Europe* (with Crispin Jones) (Ashgate, 2001); and *The World Yearbook of Education 2005: Education, Globalization and Nationalism* (with Evie Zambeta) (Routledge Falmer, 2005). He is currently working on an international publication on Intercultural Education, Religion, and Modernity. He has been a visiting professor at universities in the USA, Japan, and Greece.

Robert Cowen is Emeritus Professor of Education in the University of London Institute of Education, the immediate Past President of the Comparative Education Society in Europe, and a Senior Research Fellow of the University of Oxford. Formerly, he was at various times a Professor or Visiting Professor in the University of Brasilia, the Catholic University of Leuven in Belgium, the University of La Trobe in Melbourne, and SUNY, Buffalo. He is a member of the Editorial Board of *Comparative Education*. His most recent publications include 'Acting comparatively upon the educational world: puzzles and possibilities', in *Oxford Review of Education*, Vol. 32, No. 5, Nov. 2006; and 'Comparing and transferring: visions, politics and universities', in *Higher Education and National Development: Universities and Societies in Transition*, David Bridges, Terence McLaughlin, and Jolanta Stankeviciute (eds.). Routledge: London and New York, 2007.

Roger Dale is a sociologist of education who is currently employed as Professor of Education in the Centre for Globalisation, Education, and Societies, University of Bristol. Prior to that he was Professor of Education at the University of Auckland, following almost 20 years teaching sociology of education at the UK Open University. Much of his earlier work was concerned with the relationship between the state and education, and education policy. These interests continue, now accompanied by a focus on conceptions of relationships between globalisation and education, one of whose products has been the journal *Globalisation, Societies and Education*, which he co-founded with Susan Robertson in 2003. The main thread of his current work is the consequences of the tendential separation of neo-liberal globalisation and the institutions of modernity, of which education is taken as representative.

Dr Jianhong Dong is currently the Director of the Division of Education, Chinese National Commission for UNESCO. Previously, she has worked as first Secretary in Education for the Chinese Permanent Delegation to UNESCO. She specialized in comparative education at the Institute of Education, University of London, United Kingdom. She started serving as a member of the International Literacy Prizes' Jury in 2006.

Joseph W. Elder is Professor of Sociology/Languages and Cultures of Asia in the University of Wisconsin-Madison, USA. He received his BA and MA from Oberlin College in Ohio and his PhD from Harvard University. His knowledge of education in India draws on his many years of experience with Indian academic institutions as the University of Wisconsin's faculty coordinator for its College-Year-in-India Program. Elder has been Director of the University of Wisconsin's Center for South Asia, and for eight years he served as President of the American Institute of Indian Studies, the major consortium facilitating the study of India by America-based scholars.

Márcia Cristina Passos Ferreira holds degrees in Mathematics and Physics from Pontifícia Universidade Católica (PUC) and in Graph Mathematics from Texas A&M University-Commerce (USA). She holds a degree in Pedagogy from the University of Franca and she also holds an MA degree (with Distinction) in Leadership, Teaching, and Values in Education from the Institute of Education in the University of London. Her interests include vocational technical education and the modernisation of societies. Her residence outside of Brazil and her interest in alternative pedagogy gave her a

strong interest in comparative education and all her recent work and current research has a comparative perspective.

Maria Figueiredo-Cowen started her career as a Lecturer and Senior Administrator in the State University of Montes Claros, in Brazil. She was also a regional adviser to CAPES, a research agency of the Ministry of Education. She studied at the Sorbonne, in Paris. She undertook her MSc in University Planning and Administration at the University of Wisconsin, USA. Later she obtained her PhD from the Institute of Education, University of London where she became the Brazilian Lektor, appointed by the Institute of Education in partnership with the Brazilian Ministry of Foreign Affairs. Her publications include *Paulo Freire at the Institute* (with Denise Gastaldo) (London, Institute of Education University of London, 1995); and 'Models of Teacher Education and Shifts in Politics: a note on Brazil' (with Robert Cowen) in Colin Brock and Simon Schwartzman (eds.) *The Challenges of Education in Brazil* (Oxford, Symposium Books, 2004).

Melissa Fischer is a PhD student in the Cultural and Education Policy Studies programme at Loyola University, Chicago. She earned her bachelors degree from Syracuse University in Inclusive Elementary and Special Education, her masters in Elementary Education at Bowie State University, and her School Administration and Supervision Certificate from Johns Hopkins University. Melissa taught for five years in Montgomery County Public Schools prior to moving to Chicago to begin her doctoral studies at Loyola. Her research focuses on the education of immigrant students within the urban school setting, more specifically the academic achievement and identity formation for this population within the United States.

Eva Gamarnikow is a sociologist of education who has worked for many years in the field of critical education policy analysis. Since the election of New Labour in 1997 she has researched and written, with Tony Green, about the way social capital ideas are used as a policy strategy for social justice in changing policy contexts: the EAZs, specialist schools and academies, and citizenship education. She is currently involved in a 'Four Country Symposium' (England, Brazil, South Africa, and India) on 'Education, Equality and Social Justice' funded by the British Council, and was responsible for producing the paper on England. Eva began her career as a medical sociologist and as a sociologist of work, which situates the chapter's concern with work, employment and the occupational structure, as well as its health policy examples. Her other research interests are in human rights and the right to education. She teaches in all these fields at masters and doctoral level.

Luis Armando Gandin is a Professor in the School of Education at Federal University of Rio Grande do Sul in Brazil. He has a PhD in Education from the University of Wisconsin-Madison, is the editor of the Journal *Currículo sem Fronteiras* (<http://www.curriculosemfronteiras.org>), and has published five books and several book chapters and scholarly articles in many countries. He has research interests in sociology of education, educational policy, and progressive educational reforms.

Jose Luis García Garrido is Emeritus Professor of Comparative and International Education at the Spanish Open University (*Universidad Nacional de Educación a*

Distancia), in Madrid, and a member of the *Academia Scientiarum et Artium Europaea* (with headquarters in Salzburg, Austria), after several years being Vice-President. He has taught Comparative Education in several universities in Spain and other countries, and has also played roles of responsibility in the Spanish Ministry of Education and international organizations. In his field of specialization and research, he has been particularly involved in the field of Comparative and International Education as well as educational reforms and evaluation of education systems at international level. He has visited a great number of countries all over the world to study their educational systems, to elaborate studies, to advise governments, to participate in many international conferences and congresses, to deliver lectures, etc. His written works include 25 books and about 300 studies and articles in International and Spanish specialized journals.

Gerald Grace established the first Research and Development Centre for Catholic Education in Europe, at the University of London, Institute of Education in 1997. He is currently the Director of the Centre. His recent research study, *Catholic Schools: Mission, Markets and Morality* (2002) has attracted much international interest and a version in Spanish was published in 2007, as *Misión, Mercados y Moralidad en las escuelas católicas*. He is the Co-editor, with Joseph O'Keefe, SJ, of the *International Handbook of Catholic Education*, published in two volumes in 2007 by Springer, the Netherlands.

Carl A. Grant is Hoefs-Bascom Professor of Teacher Education in the Department of Curriculum and Instruction at the University Wisconsin-Madison, and Professor in the Department of Afro-American Studies. Professor Grant has written or edited 25 books or monographs on multicultural education and/or teacher education. He has also written more than 135 articles, chapters in books, and reviews. He served as President of the National Association for Multicultural Education (NAME) from 1993 to 1999 and the editor of *Review of Educational Research* (RER) (1996–1999). Professor Grant is a former classroom teacher and administrator; Chairperson of the Department of Afro-American Studies (1987–1990); and Chairperson of the Department of Curriculum & Instruction (2002–2005). Professor Grant has been a Fulbright Scholar in England, researching and studying multicultural education.

Jagdish Singh Gundara is Emeritus Professor of Education at the Institute of Education at the University of London. He holds the UNESCO Chair in International Studies and Teacher Education at the School of Culture and Lifelong Learning. He was appointed as the first Head of International Centre for Intercultural Education in 1979 and retained this position till 2006. He is a founding member and the current President of the International Association of Intercultural Education which is based in Brussels. He was the Chairman of the Board of Trustees of the Scarman Trust, based in London and following the death of the first President of the Trust Lord Leslie Scarman, he was elected as the second President of the Trust. Professor Gundara is a founding member of the International Broadcasting Trust (IBT), and Vice-Chairman of the Board of IBT. He was a Commissioner of the Commission for Racial Equality until its closure in August 2007. He has been the President of the Evens Foundation Intercultural Education Jury since 1997. His research interests include curriculum

studies; development studies; comparative education; citizenship education; multilingualism and asylum and refugee issues. He is the author of *Interculturalism, Education and Inclusion* (Paul Chapman, 2000) and co-editor of *Intercultural Social Policy in Europe* (Ashgate, 2000) and has published extensively in the fields of human rights and education in multicultural studies.

Silvina Gvirtz has a PhD in Education. She is the Director of the School of Education of Universidad de San Andrés and Researcher of the CONICET (National Council for Scientific and Technical Research). In 2003 she was awarded the John Simon Guggenheim Fellowship, for the project: "A comparison of models of school governance in Argentina, Brazil, and Nicaragua" and in 2004 she was awarded the 20th Anniversary Prize of the National Academy of Education of Argentina for her book *De la tragedia a la esperanza. Hacia un sistema educativo justo, democrático y de calidad*. She has published 12 books, the last one of which is *La Educación ayer, hoy y mañana. El ABC de la pedagogía*, AIQUE Editorial, Buenos Aires, 2007. She has also published more than 20 articles in refereed journals of different countries, such as England, Germany, Portugal, Australia, Israel, Venezuela, and Belgium. She is Director of the Educational Series of Granica Publishing, and Director of the Yearbook of the Argentine Society of the History of Education.

Andy Hargreaves is the Thomas More Brennan Chair in Education at the Lynch School of Education, Boston College. Prior to that, he was Professor of Educational Leadership and Change at the University of Nottingham, England and Co-director of and Professor in the International Centre for Educational Change at the Ontario Institute for Studies in Education of the University of Toronto. He is the author and editor of more than 20 books in the fields of teacher development, the culture of the school, and educational reform. His book *Changing Teachers, Changing Times* received the 1995 Outstanding Writing Award from the American Association of Colleges for Teacher Education, while his 2003 book, *Teaching In the Knowledge Society* received outstanding writing awards from the American Educational Association and the American Libraries Association. His most recent book, coauthored with Dean Fink, is *Sustainable Leadership*, 2006.

Peter Jarvis is Professor of Continuing Education at the University of Surrey. He was Chairman of the Editorial Board of *Comparative Education* and founding editor of *The International Journal of Lifelong Education*. He has written and edited about 35 books, his latest being a trilogy on *Lifelong Learning and the Learning Society* published by Routledge between 2006 and 2008. In addition, there is his latest edited book *The International Handbook of Lifelong Learning*, also published by Routledge in 2008. One of his specialist interests is human learning on which he has published a number of books, including the first volume of the trilogy *Towards a Comprehensive Theory of Human Learning*. He is currently working on a further volume looking at the process of learning to be a person in society. He has received many awards for his work, including a number of honorary doctorates, has been visiting and guest professor at a number of universities in different parts of the world, and is a frequent speaker and lecturer on many aspects of adult and lifelong learning.

Pella Kaloyiannaki received her PhD from the University of Paris Sorbonne, and she is currently Professor of Comparative Education and Political Socialization at the University of Crete, Greece. Some of her main publications are *The European Dimension in Education, the Cretan Case-Study*, 1992 (in English); *Greek Pupils and Political Socialization Research Study and International Approach* (Athens, Grigoris Publications, 1992) (in Greek); *Comparative Education a French Approach* (Athens, Atrapos Publications, 2002). She has also edited three volumes on European education and comparative education, including *Andreas Kazamias on Comparative Education: Towards a Promethian Humanism in the New Kosmopolis*, 2007. Currently she is the Deputy Chair of the Department of Elementary Education of the University of Crete and Vice-President of the Greek Comparative Education Society.

Eleni Karatzia-Stavlioti has studied Pedagogic in Cyprus and Economics at the Economics Department of the School of Law, National and Kapodestrian University of Athens. She also holds a Master of Arts in the Economics of Education awarded by the Institute of Education, University of London and a PhD awarded by the same institution. She has served in various positions in Greek education such as teacher, school principal, educational advisor, educational counselor, and vice president of the Department of Quality in Education at the Hellenic Pedagogical Institute (HPI). She has worked as an expert at the Greek Ministry of Education and the European Union on issues of her specialization. She is currently an Assistant Professor at the University of Patras, Department of Primary Education, Division of Sociology and Educational Policy teaching Educational Evaluation. She has published on issues related to educational and economic evaluation, pupil assessment, and learning in Greece and abroad.

Andreas Kazamias is Emeritus Professor of educational policy studies of the University of Wisconsin (USA) and Emeritus Professor of comparative education of the University of Athens (Greece). For many years he served as university teacher and researcher in comparative education and the history of education in the United States and Greece. In the USA he was a founding member of the Comparative and International Education Society (CIES) and for a period of time Editor of the *Harvard Educational Review* and the *Comparative Education Review*. He also served as President of CIES and the Greek Comparative Education Society. He is the author or co-author of numerous books and scholarly articles on comparative education and the history of education, and notably: *Tradition and Change in Education: A Comparative Study* (co-author); *Politics, Society and Secondary Education in England*; and *Education and the Quest for Modernity in Turkey*. He is honorary fellow of CIES, and honorary member of the Comparative Education Society in Europe (CESE). He holds honorary doctorates from the University of Bristol (England) and the University of Ioannina (Greece), and he is an associate member of the Academy of Athens.

Nancy Kendall is Assistant Professor of Educational Policy Studies at the University of Wisconsin-Madison. Her research interests include the interrelations of Education for All, political democratization, gender, childhood and vulnerability, and HIV/AIDS in Southern and Eastern Africa. Her research has examined the effects of the concomitant introduction of Free Primary Education and political democratization on school

experiences in Malawi; mechanisms for providing development education funding directly to communities in Zimbabwe; and the effects of US funding for abstinence-only-until-marriage education on HIV/AIDS and sexuality education practices in the United States, Malawi, and Mozambique. She is currently working with children in communities that have been heavily affected by AIDS to examine their experiences with formal schooling and compare these to community and international expectations for schooling outcomes. Her work has been published in *Comparative Education Review*, *Compare*, the *International Journal of Educational Development*, *Peace Studies*, *CICE*, and the *International Review of Education*.

Ayesha Khurshid is a PhD student in the department of Curriculum and Instruction at the University of Wisconsin-Madison. She holds a masters degree in Human Development and Family Studies from the University of Wisconsin-Madison and a masters in Economics from Quaid-i-Azam University, Islamabad, Pakistan. Her research interests focus on women's education, community-based schooling, and social justice education. She has worked as an activist-researcher in Pakistan before joining graduate school in the USA.

Terri Kim is a Lecturer at Brunel University, and an Associate of the Centre for Higher Education Research and Innovation (CHERI), Open University in the UK. Previously, she worked as a research consultant for OECD/CERI; a Visiting Research Scholar in International Relations at LSE in London; a Brain Korea 21 Contract Professor at Seoul National University in Korea; a Visiting Scholar at the I.E.C., Collège de France in Paris. Currently, she is an editorial board member of the *Gender and Education* journal, and international convener of the Higher Education Thematic Group for the World Congress of Comparative Education Societies (WCCES). Her research interests include international politics, historical sociology, neoliberal economic globalisation, higher education policy, governance, organisational change, international academic recruitment policy and practice, and transnational academic mobility and identities. She is the author of *Forming the Academic Profession in East Asia: A Comparative Analysis* (Routledge, 2001).

Eleftherios L. Klerides was born in Cyprus. He studied or worked (as a schoolteacher) in Cyprus, Greece, England, and France. He holds a Masters degree in Comparative Education from the Institute of Education, University of London. He completed a PhD thesis at the same university on the discursive reconstruction of national identity in school histories in Cyprus and England, funded by the A.G. Leventis Foundation in Paris. His research interests include comparative education theory and history, the study of national identities, nationhood and history teaching and writing from a comparative perspective, social theory on discourse and critical discourse analysis.

Harris Lambropoulos holds a degree in Pedagogic from Greece; a Diploma of Education in the Economics of Education of the Institute of Education, University of London; a Master of Arts in Management, Planning, and Administration of the University of Reading, England. He was awarded his PhD by the London School of Economics on Economics of Education and Human Resource Development. He has worked as an expert at the Greek Ministry of Education and the European Union on

issues of his specialization. He is currently an Assistant Professor at the University of Patras, Department of Primary Education, Division of Sociology and Educational Policy teaching Economics of Education. He has published on issues related to Economics of Education and Human Resource Development in Greece and abroad.

Marianne A. Larsen is an Assistant Professor at the Faculty of Education, University of Western Ontario in London, Canada. She completed her PhD in Comparative Education from the Institute of Education, University of London. Her doctoral thesis was titled: "A Comparative Study of the Socio-Historical Construction of the Teacher in Mid-Victorian England and Upper Canada." She teaches courses in History and Social Studies curriculum at the undergraduate level. Her graduate teaching includes courses in Comparative Education, Sociology of Education, and Policy Studies. Her research areas include global citizenship education; teachers' work, both historical and contemporary; and comparative education methodology and theory. She has been a member of the Comparative and International Education Society of Canada executive for two years as the program chair, and continues to remain active within the society. She is also a member of the Comparative Education and International Society and the Comparative Education Society in Europe.

Wing-Wah Law is Associate Professor in the Faculty of Education, University of Hong Kong. He got his PhD in Comparative Education from the Institute of Education, the University of London. His recent publications include: "Globalization and Citizenship Education in Hong Kong and Taiwan," in *Comparative Education Review* (2004); "Translating Globalization and Democratization into Local Policy: Education Reform in Hong Kong and Taiwan," in *International Review of Education* (2004); "Citizenship, Citizenship Education, and the State in China in a Global Age," in *Cambridge Journal of Education* (2006); "Globalization, City Development and Citizenship Education in China's Shanghai," *International Journal of Educational Development* (2007); and "Globalization and Multileveled Citizenship Education: A Tale of Two Chinese Cities, Hong Kong and Shanghai," in *Teachers College Record* (2008). His research interests include education and development; higher education; citizenship education; values education and curriculum; and education in Chinese societies including Mainland China, Hong Kong, and Taiwan.

Denis Lawton has spent most of his career at the Institute of Education, London University. He began in 1963 in the Sociology Department, then in 1968 transferred to the Curriculum Studies Department, and from 1983 to 1989 was Director of the Institute of Education. His first book was *Social Class, Language and Education* (RKP, 1968), and his most recent book was *Education and Labour Party Ideologies 1900 to 2001 and Beyond* (RKP, 2004). Most of his recent writing has been at the interface of historical, sociological, and political studies of the English education system. Whilst not claiming to be a comparative educationist, he has always been interested in the problems of comparisons in the field of education. He has been joint author with Robert Cowen for several publications.

Ramon Leyendecker works as an international curriculum researcher and consultant. He graduated as a teacher, and received his Masters in Educational Training and Systems

Design at Twente University in the Netherlands, where he is currently completing his PhD. He has conducted various studies about secondary education in sub-Saharan Africa, and completed research and consultancies in other international contexts. He has also lived and worked in sub-Saharan Africa for many years.

Bob Lingard holds the Andrew Bell Chair of Education in Moray House School of Education at the University of Edinburgh. He has also been Professor at the University of Sheffield and the University of Queensland. His research interests include globalization and education policy. His most recent books include *The Routledge/Falmer Reader in Education Policy and Politics* (2007) and *Teachers and Schooling Making a Difference* (2006). He is also editor of the journal, *Discourse: Studies in the Cultural Politics of Education*.

Ana Isabel Madeira holds a MSc in Sociology (from the London School of Economics and Political Science) and is currently a Research Assistant at the Faculty of Psychology and Education Sciences University at Lisbon University in the area of History and Comparative Education and Sociology of Development. Her research interests include comparative education, history of colonial education, sociology of education. She was a research member of the Lisbon PRESTIGE team and participated in several joint and personal publications of the network (see publications). Her PhD thesis was about colonial education titled *Learning to Read, to Write and to Pray: An Historical and Comparative Analysis of the Educational Discourses About Education in Mozambique (1850–1950)*.

Dimitris Mattheou is Professor of Comparative Education in the University of Athens, Department of Primary Education. He is President of the Greek Comparative Education Society, a former Vice-President of CESE, Head of the Centre for Comparative Education, International Education Policy and Communication and Co-editor of the Greek biannual journal *Comparative and International Education Review*. He has served as Vice-President of the Greek Pedagogical Institute, Head of the National Institute for the In-service Training of Teachers and member of various national policy making committees. He is the editor of several books and the author of many articles in academic journals (mostly in Greek). His research interests include policymaking with special reference to higher education and to issues of quality and of change management. (His webpage address is <http://www.primedu.uoa.gr/dmatth>)

Tristan McCowan is Lecturer in Education and International Development at the Institute of Education, University of London. His research interests include citizenship education, curriculum theory, and education in Brazil. From 2002 to 2003 he was Coordinator of the Observatory of Latin American Education Policy in Rio de Janeiro. Recent journal articles have been published in *Higher Education*, *Journal of Education Policy* and *International Journal of Educational Development*.

Gary McCulloch is Brian Simon Professor of the History of Education at the Institute of Education, University of London. His recent publications include *Cyril Norwood and the Ideal of Secondary Education* (Palgrave Macmillan, 2007), *Documentary Research in Education, History and the Social Sciences* (RoutledgeFalmer, 2005), and

The RoutledgeFalmer Reader in the History of Education (RoutledgeFalmer, 2005). He is the past President of the History of Education Society (UK) and a former Editor of the international journal *History of Education*.

Sonia Mehta is a transplanted foreign-student-turned-lecturer in comparative education studies. She received her BA in literature from St. Xavier's College, Ahmedabad, India, MA in literature, comparative literature, and language studies from Pune University, India. She received her second MA from SUNY, Buffalo in Comparative Education and went on to receive a doctoral degree in the Sociology of Education and Comparative, International Studies in Education under the guidance of Lynn Ilon, Rolland Paulston, and Greg Dimitriadis. Her current research seeks to find new ways of doing educational, sociological, and historical research which are inclusive of difference, and of (as yet) unnamed alternative *epistemes*. She does this using the tools of both literary criticism and educational pedagogy. She is an educational consultant for 'Mountain Children's Forum', an NGO working with children in the Himalayan foothills.

John Metzler directs educational programs and initiatives for the African Studies Center at Michigan State University where he also holds an adjunct position in the College of Education. He has taught and carried out research and project work on educational issues in Southern Africa since 1972. He has also been involved in project work in Tanzania and Ghana. He earned his PhD in Educational Policy Studies and Comparative Education with a minor in African Studies from the University of Wisconsin-Madison.

Wolfgang Mitter is Emeritus Professor of Education at the German Institute for International Educational Research (DIPF) and Johann Wolfgang Goethe-University of Frankfurt am Main. He was Head of Department (1972–1998) and Director (1978–1981; 1988–1995) of the DIPF. He was Chairman of the *Kommission für Vergleichende Erziehungswissenschaft in der Deutschen Gesellschaft für Erziehungswissenschaft* (1970–1972; 1987–1989), and President of the Comparative Education Society in Europe (CESE, 1981–1985), the World Council of Comparative Education Societies (WCCES, 1991–1996), and the World Association for Educational Research (WAER, 1997–2000). He is a member of the Academia Europaea and the Russian Academy of Education. He has led research projects on comparative topics, particularly on education in Eastern and Central Europe, and has published extensively on theoretical aspects of comparative education, politics of education and history of education. He is a member of the Editorial Board of the German journal *Bildung und Erziehung* and was its chief editor (1981–1996).

Robert Morrell teaches in the Faculty of Education, University of KwaZulu-Natal, South Africa. He edited *Changing Men in Southern Africa* (University of Natal Press/Zed Books, 2001), *African Masculinities* (Palgrave/University of KwaZulu-Natal Press, 2005) (with Lahoucine Ouzgane), and *Baba: Men and Fatherhood in South Africa* (HSRC Press, 2006) (with Linda Richter). He has conducted research into, and written on, various aspects of gender in education, including corporal punishment, violence, and youth masculinities.

Guy Neave is Principal Senior Researcher at the *Centro de Investigação de Políticas do Ensino Superior* (CIPES) Porto, Portugal and honorary Professor, Centre for Higher Education Policy Studies, Twente University, Netherlands. In his time, he has done a number of interesting things – Professor of Comparative Education at London University, Institute of Education from 1985 to 1990, editor of *Higher Education Policy* for 19 years, series editor of *Issues in Higher Education*. With Burton R. Clark, he was editor-in-chief of the *Encyclopedia of Higher Education* (4 vols 1992) and honorary vice-president of the British Society for Research into Higher Education. An historian, specialized in French political history, he has written exhaustingly and comparatively on higher education policy in Western Europe.

Elected in 1998 as Foreign Associate by the National Academy of Education of the United States of America, he lives in the Far West of the Paris Basin.

Liliana Olmos is Professor of Contemporary Literature and Research Coordinator of the Paulo Freire Institute at UCLA. She did her undergraduate and graduate work in Contemporary Literature in Argentina (University of Córdoba) and in the United States (MA in Education). She is currently pursuing her doctoral studies in International and Comparative Education at the University of California, Los Angeles. She is a Founding Member of the Paulo Freire Institute at UCLA (2002) and Founder Associate Director of the Paulo Freire Institute, Buenos Aires, Argentina (2003). In collaboration with Carlos Torres, she is the editor of the volume *In the Shadow of Neoliberalism: Twenty-five Years of Education Reform Initiatives in Sixteen Countries*.

Donatella Palomba is a Full Professor of General Education (*Pedagogia Generale*) in the Faculty of Lettere e Filosofia, Department of Philosophy, University of Rome “Tor Vergata,” Director of the International Doctorate in Educational Sciences, Member of the Executive Board of the Distance Education Unit of the University, Tor Vergata referee for the “Bologna Process.” She is President of SICESE – Italian Society of Comparative Education; and a Past President of CESE – The Comparative Education Society in Europe. For more than two decades, she has acted in international and comparative studies in education, her main research areas being European Education, Citizenship and Intercultural Education, Innovation in Higher Education, Distance Education. On many occasions she has acted as a scientific consultant for the Italian Ministry of Education in relation with European and international projects, and the OECD Country Report. Her last publication is *From Clerici Vagantes to Internet – A Comparative Perspective on Universities* (edited with Anselmo R. Paolone), Rome, Aeacne Editrice, 2006.

Jenny Parkes is a lecturer in Education, Gender, and International Development at the Institute of Education, University of London. She has worked for many years with young people as a researcher, educational psychologist, and teacher. Her specialist interest is in research with young people living in violent neighbourhoods, with a particular focus on South Africa. Selected publications include ‘Tensions and troubles in young people’s talk about safety and danger in a violent neighbourhood’, *Journal of Youth Studies* (2007); ‘The multiple meanings of violence: Children’s talk about life in a South African neighbourhood’, *Childhood* (2007); ‘Resisting the magnet: A study of South African children’s engagements with neighbourhood violence’, in R. Stevenson

and G. Cox (eds.) *Perspectives on Violence and Violent Death* (forthcoming); and ‘The power of talk: Transformative possibilities in researching violence with children in South Africa’, *International Journal of Social Research Methodology* (forthcoming).

George Pasiás is an Assistant Professor of Comparative Education in the Department of Special Education of the University of Thessaly. He teaches Comparative Education, European Union Educational Policy, and European Dimension in Education. He is the author of several books and articles in Greek and English. Areas of research interest include: comparative education, European educational policy, European citizenship, knowledge society, globalisation in the education. Recent publications: *European Dimension in Education* (Athens: Gutenberg, 2003) (co-authored with St. Pandides) [in Greek], *European Union and Education: 1950 – 2007, Vol. I & II* (Athens: Gutenberg, 2006) [in Greek]. He is a member of the Comparative Education Society in Europe (CESE), the Greek Comparative Education Society, and the Hellenic Pedagogical Society.

Rob Pattman teaches sociology at the University of KwaZulu-Natal, South Africa and has research interests in gender, young people, ‘race’, and sexuality. He wrote, with Stephen Frosh and Ann Phoenix, *Young Masculinities* (Basingstoke: Palgrave, 2002) and with Fatuma Chege, *Finding Our Voices: young people, gendered and sexual identities and HIV/AIDS in education* (Nairobi: UNICEF, 2003). He edited, with Sultan Khan, *Undressing Durban* (Durban: Madiba Press, 2007).

Miguel A. Pereyra is chair of Comparative Education at the University of Granada and President of CESE (Comparative Education Society in Europe). Trained both as an educationist and a historian, he specialises in historical sociology of educational reforms and the international diffusion of academic educational knowledge. Lately he has edited (with T. S. Popkewith and B. Franklin) *Cultural History & Education* (New York, RoutledgeFalmer, 2001), and (with J.C. González Faraco y J.M. Coronel) *Infancia y escolarización en la modernidad tardía* (Madrid, Akal, 2002). Juan Carlos González Faraco is associate professor of Anthropology of Education at the University of Huelva and Adjunct Professor of Anthropology at the University of Alabama as well as a member of the European Network of Experts in the Social Sciences of Education and Training (NESSE). Antonio Luzón and Mónica Torres are Assistant Professors of Comparative Education at the University of Granada specialized in comparative educational policy.

David Phillips is Professor of Comparative Education and a Fellow of St Edmund Hall, University of Oxford. He has written widely on issues in comparative education, with a focus on education in Germany and on educational policy borrowing. He served as Chair of the British Association for International and Comparative Education (BAICE) from 1998 to 2000, and is an Academician of the British Social Sciences Academy and a Fellow of the Royal Historical Association. He is currently a member of the board of directors of the Comparative and International Education Society (CIES). He was for 20 years editor of the *Oxford Review of Education* and serves on the editorial boards of various journals, including *Comparative Education* and *21st Century Society*. He now edits the online journal, *Research in Comparative and International Education*, and is series editor of *Oxford Studies in Comparative Education*.

Tom Popkewitz is a Professor and former Chair in the Department of Curriculum and Instruction at the University of Wisconsin-Madison. He holds a BA degree in History, an MA in Teaching and Curriculum, and a Doctorate in Curriculum with an emphasis on the sociology of knowledge and political science. He teaches courses related to school reforms, paradigms of educational research in curriculum studies, and comparative curriculum studies. He has written or co-edited over 25 books, including: *Paradigms and Ideology of Educational Research* (1984), *The Political Sociology Of Educational Reform* (1991), *Struggling for the Soul* (1998), and *Cosmopolitanism and the Age of School Reform* (2008). Other projects have included comparative studies of national educational reforms in Asia, Europe, Latin America, Southern Africa, and the USA. He has been awarded five honorary doctorates from foreign universities and the 2005 Teachers College, Columbia University Distinguished Alumni Award. His research has been translated into Chinese, Danish, French, German, Greek, Hungarian, Japanese, Portuguese, Norwegian, Russian, Spanish, and Swedish.

Vimala Ramachandran works at the Educational Resource Unit in New Delhi. Her research interests are elementary education, girls' education, and women's empowerment. She has published extensively on primary education, girls' education and women's empowerment and writes in *Economic and Political Weekly* (Mumbai) and *New Indian Express* (Chennai). Her books include *Gender and Social Equity in Primary Education* (2004) and *Getting Children Back to School: Case Studies in Primary Education* (2003). She has extensive experience in qualitative research, programme development, and process documentation. She was the first National Project Director of Mahila Samakhya (1988–1993), a Government of India programme based in the Department of Education.

Anita Rampal is Professor of Elementary and Social Education at the Department of Education, Delhi University. She has been involved with the National Curriculum Framework 2005 and is Chairperson of the NCERT Textbooks at the primary stage. Her special interests include participatory curriculum development, with a focus on critical pedagogy and indigenous knowledge, cognition and communication of science and mathematics, and policy analysis for equity in education. She was a Nehru Fellow, the Hon. Director of the National Literacy Resource Centre and has been involved with the Hoshangabad Science Teaching Programme, National Literacy Campaigns, and the People's Science Movement. She has written reports and research articles, co-authored books such as the *Public Report on Basic Education* (PROBE), *Numeracy Counts*, *Zindagi Ka Hisaab*, and also produced films on women's education and participation.

Fazal Rizvi is a professor in educational policy studies at the University of Illinois, where he directs its online Masters programme in Global Studies in Education. (See <gse.ed.uiuc.edu>.) He has held a number of academic and administrative appointments in Australia, including Pro Vice-Chancellor (International) at the Royal Melbourne Institute of Technology and the foundation director of Monash Center for Research in International Education. He has published widely on cultural globalization and education policy, student mobility and international education, and the shifting

dynamics of higher education. His current project relates to higher education reforms in India. He also is serving as an international panel member on the UK's Research Assessment Exercise RAE2008.

Susan Robertson is Professor of Sociology of Education, University of Bristol. She is also the founding co-editor of the journal *Globalisation, Societies and Education* as well as Coordinator of the Centre for Research on Globalisation, Education, and Societies. Her current areas of teaching and research interest include globalisation, global governance, policy formation, state theory, and teachers' labour.

Yiannis Roussakis, MEd, has worked as a teacher in primary education and is currently a doctoral candidate in Comparative Education at the University of Athens and a researcher in the Centre for Comparative Education, International Education Policy and Communication of the University of Athens. He has taught comparative education and European education policy as in-service training courses for primary and secondary education teachers and he has lectured on these subjects in the intensive programmes organized by the Socrates Erasmus Network on Comparative Education. His current research focuses on European Union education policy issues and on teacher initial and in-service training in comparative perspective. Some of his recent publications are: A. Kazamias & Y. Roussakis (2007), Education for and beyond the knowledge society: A critical analysis of the European discourse on education, in *Comparative and International Education Review*, 8, 71–91; Y. Roussakis (2006), Knowledge, employability, competitiveness: Constructing the European education area, in *Deltio*, 34, 15–20 [in Greek]. He is a member of the Comparative Education Society in Europe and the Greek Comparative Education Society.

Val D. Rust is Professor of Education at the University of California, Los Angeles. He is the Chair of the Social Sciences and Comparative Education Division of the Department of Education, Associate Director of the Center for International and Development Education, and the Director of the Education Abroad Program at UCLA. Brian Johnstone and Carine Allaf are first-year doctoral students specializing in comparative education in the Social Sciences and Comparative Education Division of the Department of Education at UCLA.

Vinathe Sharma-Brymer is currently working as a consultant in gender and education in India. She is also setting up an organisation called ActionAble India through which she is hoping to bring positive interventions in primary and higher education in India. She is continuing her research project on the perceptions of educated Indian women by collecting narratives of educated women and their daughters. Vinathe obtained her PhD and MEd Honours degrees in Education from University of Wollongong, Australia. She taught undergraduate and postgraduate courses in education at the Universities of Canberra and Wollongong. She has worked as a researcher in the areas of education and psychology. Before settling down in Australia she was a consultant and a trainer of teachers for grass-roots organisations in India. She has also worked for national and international donor agencies, as a founder lecturer and head of the department of psychology in an undergraduate college, and as a journalist.

Masako Shibata is an Assistant Professor in the Graduate School of Humanities and Social Sciences, the University of Tsukuba, Japan. She is an editorial board member of *Research in Comparative and International Education* and *The Japan–UK Education Forum*. For her comparative research, she has won a number of awards, including the CESE Women’s Network Prize awarded by the Comparative Education Society in Europe. Her most recent book is *Japan and Germany under the U.S. Occupation: A Comparative Analysis of Post-War Education Reform* (2005, Lexington Books). She has also published articles and book reviews in various academic journals, such as *Compare*, *History of Education*, *Oxford Review of Education* and *Pacific Affairs*, and in the series of *Oxford Studies in Comparative Education*. Currently she is conducting research on the teaching about World War II as “collective memories” in Germany and UK from the 1950s onward. The research is funded by the Japan Society for the Promotion of Science (JSPS).

Iveta Silova is an Assistant Professor of Transcultural, International, and Comparative Education at Lehigh University (Pennsylvania, USA). Her research focuses on the study of globalization, democratization, and policy “borrowing” in education. Her publications cover a range of issues critical to understanding post-socialist education transformation processes, including gender equity trends in Eastern/Central Europe and Central Asia, minority/multicultural education policies in the former Soviet Union, as well as the scope, nature, and implications of private tutoring in a cross-national perspective. Her most recent research documents the influence of international NGOs on education policymaking in the Caucasus, Central Asia, and Mongolia. She is the author of *From Sites of Occupation to Symbols of Multiculturalism: Re-conceptualizing Minority Education in Post-Soviet Latvia* (Information Age Publishing, 2006) and coeditor (with Mark Bray and Virginija Budiene) of *Education in a Hidden Marketplace: Monitoring of Private Tutoring* (Open Society Institute, 2006).

Noah W. Sobe is Assistant Professor of Cultural and Educational Policy Studies at Loyola University Chicago where he also serves as the Associate Director of the Centre for Comparative Education. His research focuses on globalization and the international circulation of curricula and pedagogy with a particular geographic focus on Central and Eastern Europe. Professor Sobe’s work has appeared in journals such as *Educational Theory*, *Paedagogica Historica*, and *Current Issues in Comparative Education*. He is also author of *Provincializing the Worldly Citizen: Yugoslav Student and Teacher Travel and Slavic Cosmopolitanism in the Interwar Era* (Peter Lang, 2008).

Gita Steiner-Khamsi, PhD, Professor of Comparative and International Education at Teachers College, Columbia University, New York (since 1995). Prior to her immigration to the United States, she was founder and, for 10 years, director of the policy analysis division for multicultural education at the Ministry of Education, Canton of Zurich (Switzerland). Guest professorships: Humboldt University, Berlin; Stanford University; O.I.S.E. at the University of Toronto; and University of London Institute of Education. Member of the Board of Directors of the Comparative and International Education Society (CIES) and 2009 President of CIES. She published 4 books and

over 80 journal articles and book chapters. The two most recent publications are *The Global Politics of Educational Borrowing and Lending* (Teachers College Press, 2004) and *Educational Import: Local Encounter with Global Forces in Mongolia* (Palgrave Macmillan, 2006). She does analytical work and applied research in Mongolia, Central Asia, and Europe.

Nelly P. Stromquist is Professor in International Development Education at the University of Southern California. She specializes in issues related to comparative education and gender, which she examines from a critical sociology perspective. Her research interests focus on the dynamics among educational policies and practices, gender relations, equity, and social change, particularly in Latin America. She is the author of numerous articles and several books. Most recently, she wrote *Feminist Organizations and Social Transformation in Latin America* (2006); *Education in a Globalized World. The Connectivity of Economic Power, Technology, and Knowledge* (2002); and *Literacy for Citizenship: Gender and Grassroots Dynamics in Brazil* (1997). She is also the editor of *The Professoriate in the Age of Globalization* (2007), *La construcción del género en las políticas públicas. Perspectivas comparadas desde América Latina* (2006); *Distant Alliances. Promoting the Education of Girls and Women in Latin America* (with Regina Cortina, 2000), *Globalization and Culture: Integration and Contestation Across Cultures* (with Karen Monkman, 2000).

Carlos Alberto Torres is Professor of Social Sciences and Comparative Education, and Director of the Paulo Freire Institute at UCLA. A political sociologist of education, he did his undergraduate work in sociology in Argentina (BA and teaching credential in Sociology, Universidad del Salvador), his graduate work in Mexico (MA Political Science. FLACSO) and the United States (MA and PhD in International Development Education, Stanford University), and post-doctoral studies in educational foundations in Canada (University of Alberta). He is also the Founding Director of the Paulo Freire Institute in São Paulo, Brazil (1991), Buenos Aires, Argentina (2003), and UCLA (2002). Former Director of the Latin American Center at UCLA (1995–2005), Past President of the Comparative International Education Society (CIES), and Past President of the Research Committee of Sociology of Education, ISA, he is the author or coauthor of more than 60 books and 200 research articles and chapters in books.

Elaine Unterhalter is Professor of Education and International Development at the Institute of Education, University of London. Her research interests are gender, education and development. She has published widely on education policy and inequalities in South Africa, India and Bangladesh, theorisations of gender, education and development, and the progress of the Millennium Development Goals. Her books include *Gender, Schooling and Global Social Justice* (Routledge, 2007), co-edited with Melanie Walker *Amartya Sen's Capability Approach and Social Justice in Education* (Palgrave, 2007), co-edited with Sheila Aikman *Beyond Access: Transforming Policy and Practice for Gender Equality in Education* (Oxfam, 2005) and co-edited with Sheila Aikman and Tania Boler *Gender Equality, HIV, and AIDS - A Challenge for the Education Sector* (Oxfam, 2008).

Professor Chengxu Wang, born on 15th June 1912, obtained his first degree (BED) in National Zhejiang University in 1936, Teachers Diploma in 1940, and MA degree in 1941 from Institute of Education, University of London, UK. From 1936 to 1938, he was an assistant at Department of Education in Zhejiang University. From 1941 to 1942, he was a Lecturer of Department of Adult Education in University of Nottingham and Research Fellow of Institute of Education in University of London for the following years (1942–1946). Once back to China, Mr. Wang became a Professor of Education. From 1947 to 1952, he worked in Zhejiang Teachers College as the Head of Department of Education. Since 1958, Mr. Wang had been Director of Centre for Comparative Education Studies and Director of Institute of Higher Education of the College for 40 years. During this period, he was also Member of UNESCO Education Committee in Asia and Pacific and Director of UNESCO APEID Associated Centre in Hangzhou University (from 1984), Research Fellow of Centre for Education Development Studies in Ministry of Education (1986–1998) and Luce Foundation Visiting Scholar in University of Southern California (1985–1986). Mr. Wang is now Advisor of China Comparative Education Society, Honorary Chairman of Zhejiang Higher Education Society and Honorary Chairman of Zhejiang Tao Xing Zhi Society. He is currently the tutor of PhD students. Professor Wang has written and translated a huge number of works in the field of comparative education.

Anthony Welch works at the University of Sydney, Australia, but also has experience at universities and research institutes in Australia, UK, USA, Europe, and the Asia-Pacific. He is both a policy specialist, researching national and international educational reforms and practice (mostly in higher education), and a specialist in cross-cultural analysis and research, with extensive experience in many countries. A consultant to governments in Australia and internationally, as well as international organisations, his publications which now number more than 100 often address practical policy issues. His work appears in eight languages. A Fulbright (New Century) Scholar for 2007–2008, among his books are the jointly authored *Education, Change and Society*. (Oxford 2007); *The Professoriate: Profile of a Profession* (Springer 2005); *Globalization and Educational RE-Structuring in Asia and the Pacific* (London, Palgrave/Macmillan 2003); *Third World Education: Quality and Equality* (New York: Garland 2000); and *Class, Culture and the State in Australian Education: Reform or Crisis?* (New York, Peter Lang 1997).

Wim Weymans (1975) studied history, philosophy, and political theory in Antwerp (BA), Cambridge (MPhil), and Leuven (PhD). He did an internship at the European Commission ('blue book stagiaire') at the Directorate General of Research (DG RTD) in the summer of 2005. He was also a visiting scholar in Paris, Darmstadt, Köln, and New York. As a Fulbright visiting scholar in Berkeley (Fall 2006) he was affiliated at the Centre for the studies of higher education (CSHE). Since 2006 he has also been a member of the international 'Euredocs' network (coordinated by Sciences Po, Paris). He examined how we could represent 'the past' or 'the people' by drawing on theorists such as Certeau, Skinner, Gauchet, Lefort, and Rosanvallon. He has published in journals like *History & Theory* (2004), *European Journal of Political Theory* (2005), and *Redescriptions* (2007). In his future research he will try to connect Foucault's concept

of governmentality with theories of democracy in order to develop new critical tools that could help us examine recent policy trends, particularly in Europe.

Thyge Winther-Jensen is Emeritus Professor of Comparative Education at the Danish University of Education, Copenhagen. Previous to that he was *Docent* in Comparative Education, History of Educational Ideas and Adult Education at the Institute of Education, University of Copenhagen. He was President of the Comparative Education Society in Europe from 1996 to 2000. Among his writings are *Undervisning og menneskesyn hos Platon, Comenius, Rousseau og Dewey* [Teaching and the View of Human Nature in Plato, Comenius, Rousseau, and Dewey] (Copenhagen: Akademisk forlag 2004, 2nd edition, 3rd impression (orig. 1989)). *Voksenpædagogik* [Adult Education] (Copenhagen: Akademisk forlag 2004, 3rd edition (originally 1996)), and *Komparativ pædagogik. Faglig tradition og global udfordring* [Comparative Education. Academic Tradition and Global Challenge] (Copenhagen: Akademisk forlag, 2004).
